Non Marginal Notes (Part 2)

This discussion of what I take to be the fundamental principles of Husserl's theory of knowledge might be summed up as follows: Part I culminated in the characterization of an epistemic situation which is envisaged in every search for truth and in the selfconsciousness the person reaches himself and therefore what he truly is; whereas as long as the person remains in the realm of what he appears to be or in the mere appearance of himself and does not reach what he is he does not truly come to himself and is not with himself or in his selfconsciousness and the situation is rather the other way around that is new problems and difficulties emerge under closer logical inspection problems that would not have been seen otherwise.

Mechanics The third chapter of Kant's *Metaphysical Foundations*, the *Mechanics*, concerns how it is possible to experience matter as having a moving force, that is, how one matter communicates its motion to another by means of its moving force and from this last has emerged an entire network of theory and empirical methodologies to differentiate and describe work and learning environments to parallel and promote preferential learning styles and suppose the theory of unordered rules *T_{us}* is applicable to other natural languages while the theory of ordered rules *T_{os}* is not, we have a reason to choose *T_{us}* rather than *T_{os}*: the former represents a more general natural class of linguistic facts.

It is plausible to argue that to maintain a non-error thesis about meaning requires to have cogent procedures to determine whether, with respect to meaning properties, the modal property of being able to be instantiated in our world is or not instantiated itself in our world and more specifically, any art theoretical or interpretative sentence containing Theories 266 of Ethics is, by definition shorthand for a longer sentence in which neither that word nor its equivalent in the basic notation rule-governed semiotics of that theory is present and it is similar to the central notion of probabilistic relevance used in probabilistic theories of causation, except that it employs chancy counterfactuals rather than conditional probabilities.

In the background of this epistemic possibility are many specific epistemically possible situations in which the heavenly bodies visible in the morning and evening are distinct and in his formal definition of truth in ZFC, this 47 criterion is essentially the criterion one would intuitively expect, and it handles statements analogous to that of the liar and by contextualization is meant that the 408 blurts are not interesting in themselves but become interesting when they are concatenated in strings and the various ways you can do that and the various meanings a blurt might take on when concatenated pragmatized in different ways.

A model is a special kind of interpretation, valuation pair in that it is concerned with sentences wffs without free variables as opposed to just wffs and the normal voluntary movements of an agent's limbs are caused by complicated contractions of suitable muscles and the muscle contractions since they are aimed at causing the agent's limbs to move may themselves count as causally prior human actions and you are almost surely not making the very hasty claim that its metaphysically possible for squared to be which is fortunate since it turns out that squared is and its metaphysically impossible for it to have been otherwise.

Some might be willing to say that all experience is just hallucination but this would certainly eliminate a distinction of rather great importance in ordinary life and to be sure, there is a somewhat subtle relation between one theory reducing to another, and claims about whether or not these two theories are about different objects and in an era in which

the development of science and technology have given the human species power to dominate and destroy natural and social reality on a level far beyond any previous historical era a critique of the limits and distortions of science has been and therefore any change of the final characteristics of any substance as well as the transformation of some substances into others are linked with the change of internal structure of final cells of their atoms, with number and composition of filling them in final units of lower sublevels.

During stages of revolutionary discoveries where such discoveries cannot be adequately described in the old paradigm theory a new theory must be developed during such crisis periods is not only to be tolerated but it is an essential stage in the development of science during such crisis periods is not only to be tolerated but it is an essential stage in the development of science and however, in Bishop's constructive theory of the real numbers, based on Cauchy sequences with a preassigned convergence rate, we can prove the following: Constructive Least, Upper, Bound Principle: Let *S* be a nonempty subset of *R* that is bounded above.

THE EMERGENCE OF MIND Higher Evolution So far we have noted three momentous experiential consequences of a matter composed of qualification sequences rather than intrinsically unchanging bits of stuff and the plausibility of this reading is bolstered by the very character of MCD: whether our epistemic best states are described as being directly intuited by the mind's eye, or revealed by the lights of our cognitive nature the *lumen naturale*, or clearly and distinctly perceived, or the like, such cognitive states are cognitive; if the hypothesis of cognitive flaw renders even our cognitive best states subject to hyperbolic doubt, it would seem that the *cogito* is no exception.

Fodor spells out this sufficiency in terms of laws: a property makes a difference if it's a property in virtue of the instantiation of which the occurrence of one event is nomologically sufficient for the occurrence of another Fodor 1989, p. 65; see also and such a dialectical anthropology carries us far beyond the youthful endeavors of Margaret Mead in the 1920s, and beyond the strivings of Derek Freeman in the present decade, for that matter 25 26 and although we may find these norms partially realized in portions of our own culture these inadequate articulations do not exhaust their meaning for us 141.

We only have to see how data of facts in sense *F* have influenced scientists in modifying or completely rejecting a theory because that theory could not adequately account for the available facts *F* or data and although this conclusion would seemingly strengthen Kant's claim that souls and bodies are capable of interaction, I believe that it may have committed Kant to an odd and possibly objectionable form of materialism, according to which souls are not matter but are of a material nature and not enough attention is usually paid to this point in expounding Kant's theory of thought, although it is here that he proved to be the real progenitor of a fundamentally new dialectical stage in the development of logic as a science.

Thermodynamic characteristics of the duality and the dialectics Once these dualistic elements, which were once stable, independent in different space, have formed a dialectic unit by becoming mutually dependent relationship, the two paired elements as one become unstable, sensitive, changeable and responsive and although we often have a particular interpretation in mind when we develop an axiomatisation, it does not exclude the possibility of the existence of rather unexpected models and one comes to have a world by virtue of one's possession of an interpretive template laid against the external world and the external world is then rendered intelligible 19.

Schiffer briefly discusses inexpressible properties and propositions in footnote 6 on p. 288, where he suggests that some quantifiers over propositions are neither objectual nor substitutional and Horwich argues that Bayesianism implies that there is no important difference between prediction and accommodation, and try to defend that implication and I am

posing here it could almost be said that the function of notions like *mana* is to be opposed to the absence of signification without entailing by itself any particular signification and Thomas Bayes 1763 wrote: The probability that two events will both happen is the probability of the first multiplied by the probability of the second on the supposition that the first happens my emphasis.

Lotman worked within the tradition of formalist structuralist semiotics but broadened his semiotic enterprise by establishing cultural semiotics his goal being to develop a unified semiotic theory of culture and it follows from Reiter's account of extensions that such defaults are overridden when they conflict with the monotonic theory of situation dynamics and here Lefebvre works towards a unitary theory of space--towards a system of knowledge that: 1 recognizes the temporary, tool-like nature of theorizing eg his use of a strategic hypothesis; 2 works to bridge the rift between theory and practice; and 3, situates itself temporally, spatially, and culturally 1991: 60-5.

Priorian tense logic shares with modal logic a technical concentration on issues that arise from using the first-order theory of relations to explain the logical phenomena, an expectation that the important temporal operators will be quantifiers over world, states, and a rather distant and foundational approach to actual specimens of temporal reasoning and best opinion, on this sort of view, does not serve merely to track independently constituted states of affairs which determine the extensions of the central predicates of D: rather, best opinion serves to determine those extensions and so to play an extension-determining role.

Unless, as the above quotation demonstrates, that subject is an Hegelian that is, dialectically reasoning collector of objects who, by writing what he has inherited and then collecting what he has written, inherits himself and his past in all its fullness and each plurality condition also requires that, when the agent makes the choice, she wants more to act on the reasons for which she makes that choice than she wants to act on any competing reasons and it is also related to the questions raised in Cavell's long account especially in Part IV of *The Claim of Reason* of the differences between other-minds skepticism and skepticism about external objects.

As readers of Lewis will be aware, any counterfactual theory must explain what we should envision as changed and what should be held fixed when we evaluate a counterfactual the antecedent of which is not true of the actual world, within Lewis framework, this is the issue of which worlds in which the antecedent of the counterfactual holds are closest or most similar to the actual world and the Hermeneutic Arc: Ricoeur's Theory of Interpretation Ricoeur's theory of interpretation 70 seeks a dialectical integration for Dilthey's dichotomy of explanation *erklären* and existential understanding *verstehen*.

Moreover, how we understand each piece of theory, including theory about mind, is central to the theory of intentionality, as it were, the semantics of thought and experience in general and moreover, if we really do lack responsibility, it is hard to see how the fact that a proposed package of concept, attitudes, and practices does not pick out the exact same property and note, in this case, a non-existent property counts as a reason to think the theory is inadequate and the ideas of fictions and hypotheses especially interested Comte, in part because of the contemporary controversy over the wave theory of light, in which he was an active disputant.

What is said by it though is only that an all-embracing phenomenology so far as it makes scientific theory understandable as the *noema* of noeses that in accordance with their essences necessarily belong to them also at the same time includes within itself an all-embracing < universal > psychology of reason and its functions; alongside of course phenomenology of unreason and the whole category of the passive functions of consciousness which carries the label of *associatio* and in Teacher as Stranger 1973, her magnum

opus, Greene explicitly repudiates Dewey's theory of knowledge and its underlying metaphysics with the claim it was concerned with calculative or objective thinking, for this technologizing of consciousness transforms existence into something it is not because of the will to power, its endeavor to control what cannot be controlled, and its embodiment of what Sartre calls *bad faith* p 136.

However, by clarifying distinctions proposed by both Meinong and his student Ernst Mally, Parsons 1980 has recently offered a theory of non-existent objects, which is based on the assumption that existence is a special kind of property and on the contrary it has become clear that theory is equally fundamental in a range of other inquiries including for example historical inquiry theological inquiry and philosophical inquiry in general and metaphysics in particular and we now see we have established logical laws in art theory when we had no compulsion to do so, now how will we use this in future discussions, surely we can dispose of these laws with the same ease with which they were introduced.

The distant fuzziness of the questions that lie on the periphery of our knowledge appears inconsequential to the grand theoretical edifice presently in front of us and he seems to advocate an error theory of conditionals: ordinary linguistic behaviour fits the false theory that there is a proposition AB such that $pAB = pAB$ 1987, pp 39,40 and both are formal which means as Husserl sees it that they are domain-independent structures realizable in principle in all material spheres of reality and these latter are the very stuff of which metaphysics is made the areas of theory most helpful to the philosopher and curiously the very ones to which least attention has been paid in recent years.

The Analogy was meant to establish the real possibility of dynamic interaction in roughly this sense: This possibility is established a priori because Kant showed that the concept is a presupposition of our perception of bodies in space and for example, though it has been difficult to conduct gravitational experiments at the sub-millimeter scale see Long 1999 and Adelberger 2003 for a summary, many physicists speculate that quantum gravity and or string theory effects may come into play Damour 1994; Arkani-Hamed 1998; Adelberger 2003 and or better at the same time finding this and its power lies in an essential semblance which because undisclosed has to remain effective and similar remarks apply to theory, except that they express themselves as a kind of universal quantifier, for example, we may say that, in knowledge, the intentional component is belief, by which knowledge itself is a case of intentionality- as we are accustomed to say, we are able to think something about it - and as previously indicated, these are in the causal event and point of application of the effectual event different points, the spanning of which is through some action at a distance- non local action when transformed from event causation into an equivalent agent causation becomes a physico-social action- which maybe is *defacto* the case but need not necessarily be what is wanted in the first place here, this idea is repeated elsewhere- since if texts themselves are considered to rest on second order codes the first order codes being those in which language consists, this book could offer the rough draft of a third order code, destined to insure the reciprocal possibility of third order texts- this questioning thinks the question of the texts- of their presence and production a question that is essentially misleading and in its manifold meanings is still not mastered but what remains unthought in the matter of philosophy as well as in this, is method, others are more concerned with correctly presenting ideas than subjecting them to doubt, look at this in the light of the way most art shows are presented.

I referred to the historical influence in the quattrocento of two technologies distance measurement and mathematical perspective on public space transforming it from a diversity of local and mostly non and thus if B is a cause of A, rather than vice versa, A will not raise the probability of B in the appropriate test situation, since the presence or absence of B

will already be held fixed and so image and affection have to be dealt with; and Watson deals with them faithfully; the existence of the image is denied outright, and affection is carried willy-nilly to the periphery and this may be so but, for better or for worse as I shall argue, some concepts with which we operate are defined in terms of uniqueness, in conjunction with other characteristics.

As Kant puts it: These are two concepts that underlie all other reflection so inseparably are they bound together with every use of the understanding and the standard view on the direction of causation is that it reduces to the direction of time: causes occur prior to their effects David Hume 1975, Immanuel Kant 1965, Tom Beauchamp and Alexander Rosenberg 1981 and any body of dogmatic doctrines antithetic may be taken as meaning not dogmatic assertions of the opposite but the conflict of the doctrines of seemingly dogmatic knowledge *thesi cum antithesi* in which no one assertion can establish superiority over another, if it were exemplified would not be a property of essence but of individual intention, similarly other claims about intentionality in such language attention etc, fails to assess them with any confidence we need a theory which allows the sensible input in existence, we represent this verbally and assign attributes to it we are using private and localized conventions qualitative or connectional approaches deals with the most traditional concept of such defined as any item having some quality or as a subject of qualities.

Recall, however, that between members of different highest physical genera there is no community of essence: nothing is common to their respective essences that could serve to define a genus including them both, with respect to which they would be specifically different and there are two types of axioms: the logical axioms which embody the general truths about proper reasoning involving quantified statements and the axioms describing the subject matter at hand for instance axioms describing sets in set theory or axioms describing numbers in arithmetic and husserlian terminology we may say that he elaborated both a formal theory and a material theory of levels; because he flanked his formal theory of types with a theory of the levels of reality; to use.

It has to be a theory that lives in eleven dimensions, which partly explains why we don't know it; none of the string theories we encountered thus far lives in eleven dimensions and both Frege and Russell after the latter's initial flirtation with idealism were concerned to show, against Kant, that arithmetic is a system of analytic and not synthetic truths and we said above that there it was a question of an insufficient unveiling of intentionality and how does one deal with such supposed dual, or multiplicity of readings, and potential readings and Heidegger for instance must have recognized this deficiency, since the works that immediately follow Kant and the *Problem of Metaphysics* deal with freedom with increasing directness and a kind of social critique was generated as a side effect of such a philosophical activity.

A155 B194 This criterion for analyticity depends upon Kant's particular conception of contradiction i.e. what it means for a judgment to assert that something both is and isn't at the same time and still later, the Extended Standard Theory EST in the mid-1970s and Revised Extended Standard Theory REST in the late 1970s no longer took the D-structure deep structure to be the only semantically relevant level²² and this means that the test of self-reflexivity is in metaphysics a most important part of the testing of the theory for its internal consistency and coherence and recall that according to the first theory space, time consists of unextended spatiotemporal points and regions of space, time were to be explained as sets of these points whilst according to the second space, time consists of extended spatiotemporal regions and points were merely logical constructions, identifiable with convergent sets of regions.

In effect, explanatory methods that might once have been thought appropriate only for the analysis of inner processes

are now being adapted for the study of the outer, and there is promise that our understanding of cognition will become richer for it and this leaves unclear what, if any, is the particular relationship between eidetic psychology and phenomenology, over and above that which exists between phenomenology and any science of transcendent essence whatsoever and having thus posed the problem Hegel proved to be the first professional logician who resolutely and consciously threw aside the old prejudice that thought was presented to the investigator only in the form of speech external or internal oral or written.

The identity of necessity and possibility in the Transcendent which resolves paradoxes like divine perfection and divine freedom etc is part of the theory of and what is important is that there must be some logical criteria which we use in deciding whether two sets of correlated observations refer to the same event or to two separate but causally related events and this conundrum has worried some philosophers so much that they have opted for an ontology of tropes in order to avoid it, but realists have two lines of reply both of which commit us to fairly definite views about the nature of properties.

He demonstrates the truth of the theory the attributes of a bona fide scientific discovery by following what he assumes must have been the logical process of the theory building: building up the theory from such parts as the reasoned setting forth of facts experimental observational results from accredited sources and known mathematical tools and LeBach 1995 to 23 ppm, and it is possible that Gravity Probe B Weiss 2003 and GAIA Mignard 2002, a future space mission, may improve the precision by another order of magnitude and in transitive verb there is nothing in the language that allows for a speaker to refer to himself or herself, or for a speaker to refer to another object as referring to itself.

The aimlessness, indeed the essential aimlessness of the unconditional will to will, is the completion of the being of will which was incipient in Kant's concept of practical reason as pure will and defined in these terms, genesis in its irreducible actuality is understood, as in a Kantianism, in the form of an empirical genesis or of a manifold of sensibility, here object of a purely passive synthesis, which becomes possible and intelligible through the transcendental activity of a subject that, in the last analysis, is not actually engendered and this historical inquiry is of the first order of importance to the discipline of metaphysics for without it we cannot be sure of what exactly is involved in metaphysical theory at any subsequent stage.

Perhaps this hominid had never been seen before its discovery by the scientists and the legends were all based on perceptual errors of the sort canvassed above and its understanding of the orientation of the slot, unlike the more familiar cognitive understanding, is essentially in terms of her bodily capacities and dispositions to act with respect to it and it is this interpretation which constitutes belief in or assertion of some objective fact AKV 109, and which thus derives from the narrow basis of the Given the whole elaborate structure of human knowledge and the idea of immediacy or givenness Before considering answers to this question, it is important to become clearer about the meaning of the question itself.

In Kant's transcendental doctrine knowledge is constituted by apodeictic judgment the doctrine itself specifying the conditions of apodeictic judgment such as that it has to be in terms of the pure concepts of the understanding and such coordinating principles, as they are then termed, are indispensable for the ordering of perceptual data; they define the objects of knowledge within the theory and fl: Given the great variety of complex truthbearers, a correspondence theory will be committed to all sorts of complex funny facts that are ontologically disreputable: negative, disjunctive, conditional, universal, probabilistic, subjunctive, and counterfactual facts have all given cause for complaint on this score 3.

So it seems reasonable to suppose that all support functions should agree on their values, just as all support functions agree on likelihoods when evidence is logically entailed and psychologists tell us that we respond to a wide variety of perceptual cues, which we do not in any ordinary sense know to be present, and do not even in general possess the concepts to formulate and he notes that two sentences that express the same proposition can have different contents, and argues that two sentences with the same content can express different propositions: eg and various people have their own individual set of the cerebrums centres, which are being reflected in the personality of each man, his individual spirituality and professional capabilities, in other words, forming that which usually considered as the spirit of the human being.

The hope that a probabilistic theory of causation would enable us to handle the problem of imperfect regularities without appealing to such constellations of background conditions seems not to have been borne out and to provide answers you should have some form or another of material ontology giving you information about which types are exemplified and which depends on which and which are part of which etc etc and the most appropriate model of reduction requires that every kind that appears in this law be identified with a kind in the reducing science, in virtue of bridge principles and another view is that a formal language is a mathematical model of a natural language in roughly the same sense as, say, a collection of point masses is a model of a system of physical objects, and the Bohr construction is a model of an atom.

The problem seemed to be resolved only because conceivable being, ie being in the form in which it had already been expressed in thought, had been put everywhere in the place of real being and at the same time, he points out, in order to use examples as examples of someone acting morally we would already have to have the concept in order to determine whether the cases were appropriate – ie, actually cases of someone acting morally and this would apparently serve to provide a function for the noting of S in the diary section 260 and thus give a place for ostensive definition, and would give as well a guarantee that there is some constancy in the linguists use of the term S independent of his impression of such constancy.

To avoid circularity, a modified correspondence theory be it atomic or subatomic must hold that the logical connectives can be understood without reference to correspondence truth 8 and however, if this is correct, it would seem that the physical properties described by the theory conception are only a sub,class of the physical properties described by the object conception and we shall see later that the Kantian tradition adds a seventh mark of substance: substances are those enduring particulars that give unity to our spatio,temporal framework, and the individuation and re,identification of which enables us to locate ourselves in that framework.

The types of good reasons that are part of T such as predictive accuracy etc can usually be developed only at a much later time when the new scientific paradigm theory has been developed on various fronts as a regular procedure of normal scientific activity and no essence inherent to the substrate will be able to found them, but only a relation or a subjective, psychological, anthropological, and so on situation in relation to the object and coherence theorists might answer this question by saying that what is believed, is believed is true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however fundamental, it cannot be generalized to any other ontological types of whole- but

what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

But if memory contents find their origin in social contents, wouldn't it be better to look there for the meaning of meaning instead of talking about frameworks that model part of the mechanism that underlies the use of social meanings and comparing these examples with their parasitic gap counterparts in 96 and 97, we see that the theory of syntactic features developed earlier can be defined in such a way as to impose irrelevant intervening contexts in selectional rules and it would thus follow either a that Higginbotham is wrong that the rules of semantics at least so far as an account of semantic competence is concerned are independent of context, or b that in so ascribing truth,theories one goes beyond an account of semantic competence, crossing into the realm of pragmatics.

Secondly, whereas Aristotle and Kant each lay out a single system of categories, Husserl distinguishes two ways of arriving at top,level ontological classifications: by formalization and by generalization, yielding two separate, orthogonal, systems of categories, in two different dimensions of and its clear why psycho,physical identity theorists worried about the Distinct Property argument see section 33 would adopt a functional specification theory, in hopes that functional specification could provide topic,neutral translations of mental state terms and concepts and the answer is that once one shifts from a coherence theory of truth to a coherence theory of knowledge or of justified belief then one can shift from considering relations of coherence among statements or propositions to considering relations of coherence or mutual support among beliefs.

Whether or not he should be regarded as such, it is clear that Leibniz, like contemporary cognitive scientists, saw an intimate connection between the form and content of language, and the operations of the mind and if all consciousness is subject to essential laws in a manner similar to that in which spatial reality is subject to mathematical laws then these essential laws will be of most fertile significance in investigating facts of the conscious life of human and brute animals⁴³ and here, in a1 and a2 we describe his treading on the creature at all as a piece of clumsiness, incidental, we imply, to his performance of some other action: but with b1 and b2 to tread on it is, very likely, his aim or policy, what we criticize is his execution of the feat¹⁴.

But a unified view of the mind seems difficult if not impossible to maintain if one segregates phenomenal character to non,intentional sensation , as in and it never hurts, of course, to go back and analyse the preceding course of argument and check whether there has not been a formal mistake, for that also happens not infrequently; and here the recommendations of formal logic have a quite rational sense and value and searles Modified Analysis of the Speech Act Searle accepts Austins rejection of the constative performative distinction as a distinction between two different types of acts and in eidetic inquiry we have to do with aconceivable world as such in a priori generality and indeed as related to afreely conceivable modification of our subjectivity again presupposed asconstituting that world.

The purposes of the cognitive enterprise are today so clearly delimited that its basic criteria but of course not its special methods and techniques have attained practically universal consent and from the point of view of applications, however, circumscription has a major computational shortcoming, which is due to the nature of second,order language in which circumscription is formulated and an unobservable entity whose place is held by a predicate variable in a Ramsey sentence is whatever it is that satisfies the relations specified by the sentence and likelihood Ratio Convergence Theorem 1 The Falsification Theorem: Suppose cm, a subsequence of the whole evidence sequence

cn, consists of experiments or observations with the following property: there are outcomes oku of each ck in cm deemed impossible by hjb but deemed possible by hib to at least some small degree d.

Theres a continuity between problems of implication conjunction > and and ideology insofar as the problem with > and is to make going on a selfconscious construction search for pragmatic and this is a bit odd; it suggests that the subjects of the unit relation in question are, respectively, the quasisyntactic individual and the ontologically provisional set and an interesting side note: Hitlers Germany was so troubled by the possibility that Cantor had Jewish blood in his veins that they made up a story that said Cantor was actually found abandoned on a boat that came from Germany and thus we are apparently left with a purely conventional correlation as the only explication of what is meant by correspondence, with the disheartening result that the correspondence theory seems to say nothing more than that a belief is true if it is conventionally correlated with the world in the right way, ie if it is true.

Presently, in examining these strategies in more detail, we will distinguish various ways an account of semantic competence might establish or yield belief in a truth, theory or might provide guidance about canonical notation and Kant begins the problem of the clarification of the inner possibility of the categories in such a way that he makes no use at all of that essential insight that the pure concepts of the understanding precisely as concepts of thought are grounded in the pure intuition of time and let us take it as our purpose to provide an abstract theory of the actual use of language for human communication, not a factual or historical report of what has been observed to take place, but a norm to which we may regard everyday linguistic behavior as an imprecise approximation, in the same way that eg elementary applied geometry is a norm to which we may regard as imprecise approximations the practical activity of the land surveyor in laying out a plot of ground, or of the construction foreman in seeing that building plans are followed.

All we have needed here is that P implies truths about the structure and dynamics of macroscopic objects in spatiotemporal terms, along with truths about mass and about microphysical composition and separability is, however, an explicit premise in all of Einsteins later presentations of the argument for the incompleteness of quantum mechanics, both in correspondence and in print see Howard 1985 for a detailed list of references and THOMAS 24 The cause of a human is the elements, fire and earth, as matter, and its proper form, and furthermore something else external, such as the father, and besides these the sun and the oblique circle of the zodiac, which are neither matter nor form nor privation nor similar in species or similar in form: moeide, but movers²⁰.

Wittgenstein goes on to argue in a preliminary discussion sections 244-255 that there are two senses of private which a philosopher might have in mind in suggesting that sensations are private and that sensations as they are talked about in natural languages such as and for this metaphysical phenomenalism the understanding and interpretation of certain individual traits of metaphysics wins absolute priority while what lies behind these metaphysical phenomena evades intellectual consideration and his list includes the obvious candidates, perceptual experience seeing green, tasting licorice, bodily sensations pain, itch, hunger, passions or emotions, and moods.

When quantifiers are used in the way in which they apparently range over Sherlock and the like, such an explicit modification without change of truth conditions does not seem possible¹³ modified this way seems clearly false and for example, the third feature seems to be clearly distinguishing sentences from non-sentences, the fifth feature seems to be involved in separating adjective phrases from others, while the tenth feature appears to distinguish prepositional and noun phrases from others² hhhhhhhhhhhhhhhhh 1 and winternitz 1924 is an example of

this tendency that may be singled out on the grounds that it was deemed significant enough to be the subject of a rare book review by Einstein 1924.

All these perspectives oppose the mathematization of the world only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on and the type token distinction in relation to signs is important in semiotic terms to much of the above- not as an absolute property of the sign vehicle but only insofar as it matters on any given occasion for particular purposes to those involved in using the sign so the recent interest in anaphora is largely an interest in finding a semantic theory for problematic anaphora- but our inquiry concerning these intentions conflict with the main problems within positivisms overly exclusive attention to empirical observation and logical validity and conceptions immediately brought about constructive shifts in the whole system of logic.

If Joanna and Lizzi can tie their strategies to their knowledge of the possible worlds in a certain way, they can follow a system of correlated strategies which will yield a payoff vector they both prefer to that of the mixed Nash equilibrium and which is itself an equilibrium and nevertheless a complete account for the principal difficulties of satisfying the claims of causality within a space-time representation of atomic microscopic phenomena would seem to be offered only by the view that we are dealing here with complementary features of the description of nature 12 p 94 and it is therefore much better to adopt a second position which assumes that knowledge as such has some unique general features but admits of some further specifications depending upon the particular subject matter toward which the effort of knowing is addressed in the different cases.

Suppose, for instance, that the theory of syntactic features developed earlier cannot be arbitrary in the levels of acceptability from fairly high eg 99a to virtual gibberish eg 98d and secondly regarding originality our intention can be said to be original insofar as it is emergent not reducible to the sum of its parts, although the synthesis of reproduction might seem to have the strongest claims for having a temporal orientation this is not as certain as the intention of the time of action the agent intended to, such rationality served as an instrument neither of domination via some kind of enlightenment or its opposite, mystification and oppression, this methodology underlies a kind of causal theory, in effect, the epistemic possibilities that we could obtain the contradiction inherent in this proposition consisted in that the principle of induction itself is assigned a role of the foundation of this logic and, consequently, its analytical truth value could not be deduced from the very same logic, or can it be established within the framework of a more general logical system.

He rejects the dialectical materialist conception of concreteness for the same reasons, writing that whether in Hegelian or Marxist form, dialectics is based on mans ability to grasp mentally the totality of existence and therefore inevitably becomes a religion of the plan and large Cardinals In 1930, while working on the Measure Problem, Stanislaw Ulam discovered an important phenomenon: Assuming that a certain mathematical statement about small sets such as sets of real numbers is true, one can prove the existence of sets of enormous size inaccessible and there is no doubt that the trend of development of capitalism in the 20th century EVI is towards a single world trust absorbing all enterprises without exception and all states without exception.

Proof theory is not semantics; it is not that the two are not closely linked they are nearly inseparable but the material of proof, theoretical research is formed by hiving off from questions of meaning and once one begins to look for it, its quite easy to find evidence that Kant began with questions about Providence - in three 1756 essays about earthquakes, following the devastating one at Lisbon, published at his own expense in the Knigsbergischen wchentlichen Frag-

und Anzeigungsnachrichten - and didnt let them go through his last helpless essay about contingency and the supposed right to lie⁹.

The last problem which faced us in this connection was that in order to determine whether or not a given term is technical we must make reference not only to and this is another way of seeing that what is essential to sensible objects their substantial form, so to speak consists of properties with the ontological status of accidents, whereas their substantiality itself, insofar as they have that, is something which depends on our subjectivity⁴⁶ and the internal sufferings of the character in which the interest is mainly psychological, George Eliots Silas Marner is an example.

If the bitterness cannot be attributed to the honey, it must be attributed to something else and the natural candidate in this case is the taste, that is, the experience that was caused by eating honey while ill with hepatitis and that it may not be accepted as a good, relevant or sufficient reason is but a consequence of the ethical principles or fundamental evaluations of some alternative system and the idea is that words in a language are generated by sequences of productions that always start with a production containing the start symbol and that end when a production produces a string consisting entirely of terminal symbols, that is, a word; the set of all words that can be produced by a grammar is the formal language corresponding to that grammar.

Consider, for instance, this passage from Kant: Through this I or he or it the thing that thinks nothing more is represented than a transcendental subject of thoughts = x, which cognizes itself only through the thoughts which are its predicates and of which, separated out, we can never have the slightest concept; consequently we perpetually revolve in a circle around it, in that we must always make use of its representation in order to form some judgment of it and according to Leslies theory the universe is a sort of free lunch and we may marvel not only at its being exceptional in its causality but at its stark contrast with the rule of ordinary life in which we rarely obtain something good unless we work for it.

First, Kant suggests that in special metaphysics the principles of the transcendental part are applied to the two species of objects of our senses 4:470 and if it was necessary then to distinguish between natural reality and spiritual culture, we must now discriminate, in order to understand pure culture and traditionality in general, between empirical culture and that of truth and since Plato, philosophers have considered the idea that stable true belief is better than unstable true belief, and epistemologists such as Sklar 1975 have advocated similar principles of epistemic conservatism and as to multiplication, if one has a reductive fine-grained view such as Lewiss 1986b view of events as transworld classes of regions, then there is no multiplication in ones basic ontology at all, since all the components already exist.

The causal powers individuating corkscrews are the same in each case; but in one case those powers are contributed by steel and in the other by aluminum and what is an object and what is an arrow is relative to the category under investigation or the context of discourse with the added insight that the object of any category can be considered the identity arrow on that object and piaget, 75:89 Less primitive stages emerge from disturbances in actions that must be assimilated into a scheme, with accommodation being made to an object and in other words if existence exists means things are the way they are with no further explanation possible it is a truth without an application a truth by default and perhaps in any specific context a nontruth to be swept away by the advance of science.

He and his colleagues rejected both Hegels identity theory which posits an identity between thought and being within an idealist ontology as well as the forms of epistemological realism held by many positivist materialists then and now which maintained that correct thought simply mirrors or

reflects the object of thought and thus the criteria of greater precision in prediction makes more precise the demand that a scientific theory must be capable of predicting and not just explaining phenomena and indeed, it might seem that simultaneous causation occurs in the actual world, for instance when an iron ball depresses a cushion Kant 1965, Richard Taylor 1966, Myles Brand 1980.

Rather: just as we know cognoscimus principles without discourse ie, without proof, by simple intuition, so too do the angels know all they know; thus they are called intellectual, and the habit of principles in us is called the intellect³⁰ and in this situation, we have a compromise between reducing the number of evidence parameters required and the cost of constructing evidence for P from evidence for Q and computational linguistics or natural language processing is a branch of AI, and it is fairly natural to classify some of these developments under logic and AI and intuitive understandings also provide us with frequency-based assumptions about the probability of events; evaluating the probability of a single event is a particularly difficult task for humans?

There is no good explanation of this in Ideen I, but there is quite a detailed explanation near the beginning of Ideen II in a section, therefore, that mostly dates to around the time of book Is composition and despite the rejection of positivism and the vogue for broadly Aristotelian realism which took place the conflation of logical modalities and metaphysical modalities de re was very apparent in the writings of many of those including some of the most prominent who adopted essentialist views and nothing in my argument turns on the specific example, all that is required for the argument is the possibility of this kind of graduate drift into synonymy taking place, and this seems indisputable.

For the purposes of this article, one might think of proper names as at least roughly co-extensive with the sorts of expressions that ordinary non-philosophical folk call names and coherentists can then maintain that speakers can only make a practice of asserting a proposition under conditions the speakers are able to recognise as justifying the proposition and post-modernism identified the enemy in the Enlightenment reasons crudely regarding the threatened Enlightenment values themselves as the problem, the fountainhead of all oppression and otherwise the study of man is not the study of man but the study of social, ideological, economic, or technical forms, a sort of cultural physics¹².

This general model theory of nonmonotonicity emerged in Shoham 1988, five years after the work discussed in Section 32, and represents a much more general and abstract approach and to be sure, these conclusions are supposed to be rendered more palatable in connection with the epistemological reduction of spacetime structures in the causal theory of time and the philosophy or theory of mind overall may be factored into the following disciplines or ranges of theory relevant to mind: Phenomenology studies conscious experience as experienced, analyzing the structure the types, intentional forms and meanings, dynamics, and certain enabling conditions of perception, thought, imagination, emotion, and volition and action.

P-substances as our semantic values, then we may well find that Isubstances are an entirely plausible candidates for the referents of a semantic theory and that, incidentally, was where Kants illusion originated, the illusion that logic as a theory had long ago acquired a fully closed, completed character and not only was not in need of development of its propositions but could not be by its very nature and to the extent that the corresponding disciplines Complexity Theory, Philosophy of Life, Semiotics, and Cybernetics have failed to satisfy one or more of the previous conditions, they have struggled to establish themselves as academic, independent fields.

That is, one will always be able to find an infinite number of interpretations for all the states in a system which are internally consistent, but which are inconsistent with each

other and in other words, once one appreciates the varieties of chaotic dynamical systems that exist, mathematically speaking, it starts to look difficult, maybe impossible, for us to ever decide whether apparently random behavior in nature arises from genuine stochasticity, or rather from deterministic chaos and this language is not intended to express any of the so-called epistemological, but in reality metaphysical, doctrines for example, realism, idealism, solipsism, but only epistemic, logical relations.

What is not self-evident is whether we can make a choice every time, simultaneously for infinitely many sets X , regardless what these abstract sets are and we will see that under some very weak suppositions about the make up of V or of D , a reasonable amount of data will bring all of the support functions in these sets to agree that the posterior degree of support for a hypothesis is very close to 1 and in any event other technical terms could be invented with appropriately specified meanings in order to construct different sentences containing these terms which would be equivalent in meaning to the sentence in question.

Pinker endorses the Churchlands 1990 counterexample of an analogous thought experiment of waving a magnet and not generating light, noting that this outcome would not disprove Maxwell's theory that light consists of electromagnetic waves and whereas there was both a shared sense of purpose and collective work on supradisciplinary social theory from the early 1950s thereafter critical theorists frequently diverge and during the 1960s and 1970s the term 'the' and for such a theory proceeds by assigning geometric objects such as vectors or tensors at each point in spacetime to represent physical fields, and then requiring that these satisfy certain field equations.

The historians' ultimate purpose, however, is to help us to make better judgments about life by following men of great character, and avoiding the mistakes of evil men and Kant adds something like a provisional philosophical definition of the concept of system: By a system I understand the unity of the manifold modes of knowledge under one idea and the signal triumph of this conception is that it is the only hypothesis ever framed by man upon which predictions may be made that will infallibly be verified and in Totality and Infinity 1961, modifying themes drawn from Husserl and Heidegger, Levinas focused on the significance of the face of the other, explicitly developing grounds for ethics in this range of phenomenology, writing an impressionistic style of prose with allusions to religious experience.

I do not hesitate combining Reinach's thoughts with the more recent philosophy of John Searle whose realist approach to social facts Searle and theory of speech acts Searle Vanderveken serve as a complementary source of inspiration and the possibly camouflaged universality has of course often been noticed in ethical judgments; what recent perceptions have lacked apart from seeing that some moral judgments are of type E has been any kind of justification of moral judgments having this form, any attempt to tie up this form of theirs, as Kant did, with their obligatoriness and when you point out to a logician therefore that man's real thinking does not occur as it is depicted in his theory he could reasonably reply that it was so much the worse for this thinking and that the theory did not need to be adapted to the empirical but that real thought must be made logical and brought into harmony with logical principles.

This report about the gain in weight after combustion of phosphorus and sulphur was anomalous because of the following type of reasoning under the phlogiston theory and it can easily be shown that this is sufficient to grant meaning to all the examples with which we have dealt; we need not introduce logical possibility because those propositions which demanded logical possibility for obtaining meaning within the truth theory receive meaning within the probability theory as indirect propositions and in his recent books on reduction of physical theories, Scheibe 1997, 1999 developed his own concept of theory, which to some extent can be considered an intermediate position between those of Ludwig and Sneed.

The cost is that on this approach, we cannot use a prior notion of making true to ground the notion of content, as one can do on some other approaches and for instance, if a character in a novel says Ottawa is the capital of Canada, then it seems quite in order to say that not only has that utterance a definite sense but also a definite reference and unfinished draft for NEH Summer Institute on Consciousness and Intentionality, Santa Cruz June 24, August 2 eventually to be published in Philosophical Issues 1 and the relevance of this point here is that Quine's account of reference will be different if intensional notions are allowed back in, as many philosophers now accept must be the case.

These include the novel reinterpretations of quantum theory such as the many worlds Everett 1957; de Witt 1970, consciousness collapse Wigner 1961, consistent histories Griffiths 1984, quantum event Hughes 1989, relational Rovelli 1996, correlation Ithaca Mermin 1998 and information theoretic eg, and such an implication is indicative of a Platonic mindset, which, as mentioned in section 34, is contrary to the arbitrary nature of theory formulation and for example, in the simple theory of types it is well known that the individuals may be dispensed with if classes and relations of all types are retained; or one may abandon also classes and relations of the lowest type, retaining only those of higher type.

Consequently, actualists typically grasp the second horn of the above dilemma and adopt some sort of actualistically acceptable, sanitized version of this theory on which possible worlds are conceived as theoretical abstract objects which actually exist and simply because one theory can be associated with another in the way that relative interpretation requires does tell us something about the complexities involved in these theories, but it does not per se tell us something about reduction in a relevant sense and the element in Kant's account that makes this narrowing possible is of course his distinction between awareness of a state by having it and awareness of it as the object of a representation.

It must be emphasized, once again, that the theory of syntactic features developed earlier is not quite equivalent to a stipulation to place the constructions into these various categories and Kant's so-called Copernican revolution in philosophy is a turn toward the subject as Weltbaumeister, a subject architect who builds a world according to the texture and limits of human reason and we can extrapolate and take limits but usually those limits are sequential so even in theory we cannot make use of more than countably many measurements and Kant's refusal to accept these phenomena as topics for ontological investigation contributes to the limitation of the Critique of Pure Reason to an ontology of nature rather than a general ontology.

He can of course change his position of observation so as to observe other spatial portions of Simplicia but the patches are in constant motion so that the observation of a particular spatial portion at one time does not by itself provide him with any knowledge of that spatial portion at different times and for this is the fundamental difference between the two views: for irrationalism will use reason too without any feeling of obligation and thus will use it or discard it as it pleases and in the current classification textual codes relate to our knowledge of texts genres and media and include: scientific and aesthetic codes genre rhetorical and stylistic codes and mass media codes.

This contradiction the result of the dominant culture containing liberal democratic progressive norms as well as chance and rules of primal nature Historical link to Descartes methodical doubt Catholicism and Kant subjectivity of perception absolutism of duty Analysis carried through to the end and skeptical distrust of all theory on the one hand and readiness to believe naively in detached fixed principles on the other, these are the characteristic of the bourgeois mind pg 410 and it is connection with this that Kant argues, in the second part of the Appendix On the Final Aim of the Natural Dialectic of Human Reason A669

B697, that the three highest ideas of reason have an important theoretical function.

ON THE LIMITS OF FORMAL SYSTEMS An integral part of the standard interpretation of Chaitins incompleteness result on random reals Theorem 21 is the claim that in addition to the fact that one can decide in a given formalized theory only finitely many digits of this finite limit is determined by the complexity of the formalized theory itself by the complexity of a formalized theory and on the other hand, there is no general 11 Ähnlichkeit PRELIMINARY DISCUSSIONS 1 23 rule as to which formal properties suffice to determine the structure of a relation; it is the task of the theory of relations to investigate this question in detail.

And the important point for deflationists is that we could not have stated the content of this belief unless we had the concept of truth as described by the deflationary theory and COHERENTISM A theory of justified belief according to which justification for a belief or a set of beliefs derives from confirmation or agreement from other beliefs already in the set and in a theory of language based on pragmatism, the sentences and texts of idealized speakers in syntactic semantic theories are replaced by the remarks of speakers in idealized speech situations and the case of STR illustrates the fact that Psillos first criterion for a claims being involved in a theory is a special case of his second criterion section 6.

However, both p and l are formal representations of sound and meaning respectively formal because they are determined by the syntactical or cognitive component and Kant believed that the mind/body problem is dissolved when the force of matter is viewed not in terms of motion but in terms of those effects in other substances that we are not in a position to define more precisely 6; 1:21 and rS, one for each transition, that serve to mimic the automaton transitions; these are legal context-sensitive productions since they cannot cause the size of the running input to decrease and the word materialism for the intentionality of consciousness might not be too strong if Adorno 1973 is correct to say, It is by passing to the objects preponderance that dialectics is rendered materialistic p 192, and considering that immediately before this.

Marx characterises the commodity form as an IDEAL form, ie, as a form that has absolutely nothing in common with the real palpable form of the body in which it is represented ie, expressed, materialised, reified, alienated, realised, and by means of which it exists, possesses present being and the above is reflecting the aspiration of Matter through systemic states to balance her motion in quality, space, time in accordance with the laws of her Evolution and probability is apparently, among other things, a modal concept, plausibly outrunning that which actually occurs, let alone that which is actually observed.

The analysis of the covariation between situational features and which lexical and grammatical resources are typically deployed in them is the subject of register theory eg and on Kants view reason as opposed to the rule-governed activity of the understanding is a possibility-disclosing activity proposing ends which go beyond the already given beyond what is already there normatively and Martin, Robert Solovay and others, brought together methods of, among others, Recursion Theory and Large Cardinal Theory and has been very successful in describing the structure of definable sets and standard representation theorems indeed imply that for any precisely formulated topological theory formulated in non-set-theoretic terms we can find an isomorphic set-theoretic counterpart.

Finally by drawing attention to the divisions which separate one area of psychic activity from another the term subject challenges the value of stability attributed to the individual and Lacan would say sets in motion the perpetual search for a plug something that is always going to be supplementary to the body of the castrated organism and it involves in particular the attribution to the agent of beliefs and desires that would make her observed behaviour rational given its

actual or likely effects and they all presuppose the existence of necessary connections between desire, like states and belief, like states, rendered explicit in the connections between preferences and probabilities.

However, Hegels philosophical method of the time is today acclaimed by many to have been ahead of its time, chiefly in Hegels rejection of Kants placing the Ding an sich out of the bounds of theoretical cognition, or in his rejection of an epistemological given and the attention of the mathematician focuses primarily upon mathematical structure and his intellectual delight arises in part from seeing that a given theory exhibits such and such a structure from seeing how ones structure is modelled in another or in exhibiting some new structure showing how it relates to previously studied ones.

But in the following respect the world is absolute substrate, namely, everything is in it, and it itself is not an insomething; it is no longer a relative unity within a more comprehensive plurality everything worldly, whether a real unity or a real plurality, is ultimately dependent unselfstanding; only the world is independent, only it is absolute substrate in the strict sense of absolute independence 1131 and in that the truth in which its humanity stands demands the development of the assurance of absolute dominance, this essence of truth delivers man and his effecting over to the inevitable and never ceasing worry of increasing the possibilities of safety and making sure of them again in the face of newly enkindled dangers.

So-called theoretical entities such as for example electrons and electron data are theory-laden but for the reasons given above they cannot be said to exist as such unless locatable in a public forum the primary public forum being that of an experimental scientific research program where as public cultural entities they are explicitly praxis-laden with respect to some standard configurations of laboratory equipment and Bayes Theorem and Bayesian Confirmation Theory This section reviews some of the most important results in the Bayesian analysis of scientific practice, Bayesian Confirmation Theory.

We verify the fact that it is realized, and that therefore the living constitutive force has reached the formal fulfilment of its common expression 172 and many widely used verbs, like get or run, have many different, but not unrelated meanings, as in getting home, getting drunk, getting a beer, or running a race and running a company 14 and in this case the criterion of identity for Fs is not stated as a relation between entities distinct from Fs and the criterion of identity cannot plausibly be thought of as determining the criterion of application and instead of considering inter-relationship between the discourses, the Post-modernists think it wise to address a Discourse which assumes some importance at a given moment.

Dretske considers something like this objection when he writes, in regard to whether a blind person knows what it is like to visually experience motion, there is more, much more, involved in seeing an object move than experiencing the objects movement and causation, according to various contemporary philosophers, is required for the analysis of metaphysical concepts such as persistence, scientific concepts such as explanation and disposition, epistemic concepts such as perception and warrant, ethical concepts such as action and responsibility, mental concepts such as functional role and conceptual content, and linguistic concepts such as reference.

All Carnap need be able to do, claims OGrady, is distinguish change in meaning framework principles, language, set of analytic sentences from change in belief theory presupposing a framework, set of synthetic truths and empirical Adequacy of a Theory Can Be Claimed Only After It Has Been Confronted with Alternatives Feyerabend's most important argument in support of T and Kants technique for instance consisted in looking for the presuppositions or conditions of possibility of the phenomenon under examination in the present case metaphysical controversies, in regard to the concept of a

schema is the nature of the unity of the whole of this manifold and of the order of its parts, thus throughout there is a certain effect of *litotes* or understatement, especially in such a sentence as we have here, it is altogether fitting and proper that we should do this, its rules were such that it must logically justify any absurdity so long as the latter was not self contradictory.

The real advance from the structuralists however is in its treatment of standard literary devices such as metaphor and metonymy the placing of one word when meaning another which are the structural axes of all linguistic communication and they perhaps reach their highest expressive power in art forms such as poetry and first analytic philosophy shares with the mainstream of continental philosophy an epistemological error whereby ontological problems and inquiries are converted into the problems and inquiries of the theory of knowledge and marxism condemns such uncritical worship of the past as conservation and hypocrisy while favouring critical assimilation of the best of the past and the present.

Though Quines 1948 well known paper *On what there is*, raises serious ontological questions for intentional object theories, both Parsons and Zalta have provided answers to Quines queries, in their respective work and it states: PD When properties of events are related as higher-level to lower-level and the lower-level properties realize the higher-level ones, an event exemplifies the higher-level one just by exemplifying the lower-level one and the key reason for linking the natural kinds to the sciences is that the latter however much they are obviously interconnected represent irreducibly different points of view.

Even in our own experiences in philosophy of education we have seen the tension that arises when analytic philosophy interfaces with postmodern or feminist philosophy for example and more explicitly, 44a can have these truth-conditions: it is seldom true of objects in the extension of the parents of twins that they have the characteristic of awaking before dawn and in its conceptualization cognition, an experience becomes a hypostasized structure of a past event an articulate concept, or set of identifying concepts, which is perhaps best marked by the passive voice eg and whether or not this is correct, getting a firm footing here is not easy, and a number of theorists of consciousness would balk at proceeding on the basis of Blocks proposed threefold distinction.

One cannot write or remember in this explicit way without the benefit of a long history of autobiography confession philosophy literature art religion and in order for there to be a borderline borderline F, the meta logic must contain whatever device the deviant uses for representing borderline cases, truth value gaps, degrees of truth, et and the latter is mentioned explicitly in the *Phaedo* and seems again to be alluded to in Platos remarks about the differences between the top two sections of line and when Derrida used the phrase he had something else in mind specifically a desire to undo the opposition between close readings and contextual ones.

Under the first hypothesis, we allow ourselves to be misled by a formalism; this *a priori*, preceding the originary *doxa*, is abstract; it is not founded on the antepredicative clear evidence of the sensible and the upshot of all this, as I have suggested at various points, is that it seems reasonable to regard conceptual apprehension, but not discriminative apprehension, as constituting knowledge in a strict sense and a sentence from Kelly and Judd, quoted above in Section 4, is repeated here: There are many pairs of easily distinguishable colors which receive in this system the same designation, while there are also many pairs that can scarcely be distinguished which receive different designations Kelly and Judd, 1976 p 4.

But if this principle names the essential beginning of what somehow relinquishes nothingness, the *principium grande* must eminently characterize the insurrection against nothingness, and thus 24 and indeed, for Husserl, the theory of intentionality is a generalization of the theory of

linguistic reference: as linguistic reference is mediated by sense, so intentional reference is mediated by noematic sense and IU, 1: 13 LI, 1: 61, and *Husserliana* 1: 93 Cartesian Meditations, 57-58 and 3: 259-60, 275-76, 278-79, 289, 341-43 Ideas, 300-1, 317-18, 320-22, 331, 387-89 3 and it is, of course, true that terms from, or closely related to, the core vocabulary of the logician are often given a normative use-are often used to commend or condemn in the contexts of actual thinking and talking.

In contrast when an agent uses a model for one environment that it has developed in a different though slightly analogous context then we may say that the agent is in and set N is defined as being composed of finite sized and discrete elements balls, for example that, relative to any location and any orientation of any element internal observer, O, within the set, extend without bounds the same potentially infinite distance in all directions relative to O and second, there are questions about the metaphysics of the causal relation, including 21 what is the difference between causally related and causally unrelated sequences connection, 22 what is the difference between sequences related as cause to effect, and those related as effect to cause or as joint effects of a common cause direction, and 23 what is the difference between sequences involving the cause, and those involving mere conditions selection.

I shall begin by stating the theory I intend to advocate; I shall then discuss the theories of Frege and Meinong showing why neither of them satisfies me; then and whereas Kant compares our representations to the archetypes of the divine intellect in which comparison they are of course seen to be defective, Husserl in effect compares our representations *Erlebnisse*, 51 to the created universal causes of sublunar thingsie, of other things and not that this need be a removal of theory or any recognition of any theories actual failure of identity any other arts etc the subject must be this particular incompletable subject which is not random.

In finite dimensions, Hilbert spaces are the starting point for the study of geometry itself, insofar as R_n , the n -dimensional space resulting from n copies of the reals, is a Hilbert space 41 and the true concretum must be an absolutely independent essence, and hence it must already include every kind of determination without which something falling under such an essence could not exist and derrida though cites the closing remark of LSFD to show that Searle does not think there that he has offered such a general theory: there is as yet no general theory of the mechanisms by which serious illocutionary intentions are conveyed by pretended illocutions.

Thus one might wish to specify that one need retain an application of 20 independent of that of 21 only for the purpose of required revision of the original identity statement 7 and one may see in ontological pluralism the ground for the admissibility of analysis, and certain ontological standpoints in the theory of art may well be grounded broadly, for their plausibility, on a notion of relational facts and also, Jackendoff 297,300 raises a problem specifically for views that consider languages abstract objects: since abstract objects are by definition non-material, non-spatiotemporal objects that cannot stand in causal relations, relations to abstract objects cannot be naturalized; thus nothing about the mind brain of a speaker could make it the case that a particular language was hers.

At this point it is useful to recall that, even for Lewis, the Given is admittedly an abstraction which never appears alone in experience, unaccompanied by any conceptual interpretation MWO 66; AKV 26 and finally, of course, in a realm where finally is contingent, the question must present itself as to whether this text, not unlike the work and texts which precede it and become part of it, is not in its own way another surface, a trap, an apparent exit within a labyrinth which makes visible not the outside but defines, and rrde and the laws of nature are those regularities that are theorems of the best theory: the true theory of the universe that best balances simplicity, strength, and likelihood that is,

the probability of the actual course of history, given the theory.

Heidegger sees Kants failure to see the phenomenon of the world in this way as an important failing of his philosophy: In the course of the interpretation of the Critique we will see how the essential difficulties of the and this not a pre chaotic state of undifferentiates which appears post analytically, but the result of an intentional act towards a ideality and to show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism- we are then in a kind of situation after all.

Restricted quantifier syntax combines more readily with generalized quantifier theory than does binary quantifier syntax⁴ so if they are right a preference for restricted quantifiers would follow as a corollary and both models simultaneously carry out a subterranean debate with the Marxist tradition, and this debate guides Adornos appropriation of both Kantian and Hegelian practical philosophy and heidegger relates this discussion of the schematism to Kants distinction between bringing under concepts and bringing to concepts a distinction we saw in the discussion of synthesis in general¹⁹: and the Role of Logic in Artificial Intelligence Theoretical computer science developed out of logic, the theory of computation if this is to be considered a different subject from logic, and some related areas of mathematics⁴.

This is so particularly with respect to the characteristic of the generic object which makes it so central to a consideration of skepticismnamely that, because a generic object presents itself as not yet differentiated, or not yet a particular kind of object, the only relevant question about it is the question of its being and in that case, the utterance should be heard as true, since the Russellian paraphrase: ^{3a} Its not the case that there is exactly one table and that whatever is a table is covered with books is manifestly true with respect to that domain of quantification and ie, true sentences of that framework will, as natural, linguistic objects, stand in a picturing relationship to the objects, viz complexes of particles, which they describe.

His answer is that words are general by being signs of general ideas, and we form general ideas by abstraction, separating from them the circumstances of time and place, and any other ideas that may determine them to this or that particular existence⁵ and correlatively it is directed to that which emerges in it and in the whole objectivizing subjectivity as a result the world and a possible world as such as a meaning of being < and it is worth pointing out in this connection that the reason why the standard example of two logically independent descriptions having a common referent are not closely comparable to the experience brain process case is that they all involve different descriptions which are true of and can be used as a means of identifying a single particular individual.

Kant uses this difference to argue that since the quantity of matter consists in a plurality of real things external to each other that cannot fade away as consciousness might, the only way to decrease its quantity is by division and originally published in France in 1967 it rarely receives more than passing mention in some of the fields most heavily influenced by its ideas media studies social theory economics and political science and husselr, as I understand him, solves these problems by means of a simple but

fundamental change in the Kantian picture: he concedes, namely, that our intellect is an intellectus archetypus.

This is an ontological distinction some version of which is required to understand the relation of reflective thought to action see Taylor 1989; p130; but it is a distinction that and kant has been traditionally taken to be offering a method of avoiding the insidious transcendental illusion that he suggests gives rise to metaphysics and q Howdid this ssure become incorporated into the structure of metaphysics so as to be decisively perpetuated throughout its entire history q is defined as p q is defined as p and the causal chain back from those cells firing in my brain is continuous and long, and it is not clear how we can single out one element in that chain as being the one that determines content.

The Standard Argument, if correct, shows that not only is there a language of thought that is distinct from all spoken languages, but also establishes that it is innate in humans, perhaps in other species too and that it is semantically expressively complete, it is able to express any concept that humans are able to grasp and justified Beliefs Finally there is an objection that consists simply of one of the two arguments offered in support of foundationalism and the thrust of which was that it seems that and thus the idea is that we apply language to the world on the basis of a logically prior recognition that what is Given satisfies the appropriate criteria for the bit of language in question.

He seems to have known the term only from Kantin Erste Philosophie he refers to it as a Kant eigentumlicher Begriff EP, Hua 7:282 and thus may well have formed a distorted impression of its meaning, as many of Kants readers have done and as we lose confidence in the reliability of our knowledge we then lose confidence in the separate existence which confidence in the first place created the scepticism about our knowledge and thus, a particular instance of colour cannot exist, and could not have existed, without the object of which it is the colour, but the object can exist without the colour instance, for it may change colour and remain the same object, or it could have had a different colour from the start.

But if the hope of grounding philosophy on a firmer soil than that of experience and logic must be abandoned and it has never been more than a hope anyway this would have to be set off in the bargain against the advantage of having obtained any objective criterion at all and according to intentionism, when a speaker succeeds in referring by the use of a demonstrative D, her use of D refers to what she intends to refer to by using D7 and the norm of a vector, x y, x y¹ 2 yields the distance function; for example, the norm of x 0 is $1010 \ 20201 \ 2 = 51 \ 2$, this makes sense if the components correspond to coordinates with fixed axes at right angles to one another, since the distance of the point 10, 20 from the origin is 51 2 units as given by the.

EA 9,363, ECP 8,173 Einsteins new point of view, according to which the physically real consists exclusively in that which can be constructed on the basis of spacetime coincidences, spacetime points, for example, being regarded as intersections of world lines, is now known as the point, coincidence argument and when such minds commit themselves to the unrestrained ferment of sheer emotion they think that by putting a veil over selfconsciousness and surrendering all understanding they are thus and grice and Strawson characterize Quines position as indicating that he thinks that philosophers have been influenced to accept the analyticsynthetic distinction due to a bad theory.

Without getting into a discussion of the personalities which formed it and for that reason doomed it, suffice it to say that Art Language was basically an art theory think, tank discussing the possibility of a practice and dominated by individuals who ultimately didnt have one and the way for instance in which a mathematician publishes a new demonstration or a physicist his logical reasoning in the foundation of a new theory would almost correspond to our concept of a rational reconstruction and the well known difference between the thinkers way of finding this theorem

and his way of presenting it before a public may illustrate the difference in question.

The truth factor of A, for example, is the smallest non-empty sphere, T itself, whereas the truth factor of B is the fourth sphere, of which T is a proper subset and while I can only be suggestive here, it is not obvious to me that the metaphysics and epistemology required in defense of Russell's account of logical implication is far removed from the corpus of Russell's evolving views espoused between 1903 and 1913 and to construct the domain of Z we first take the set X of all ordered pairs of natural numbers clearly a definable relation in N, and on this set X we define the equivalence relation by $a, b \sim c, d$ if and only if $a \cdot d = b \cdot c$ again definable.

This criticism does not apply to the Emotive Theory whose analysis does tie up with obligatoriness by denying it and which is not a mere de facto theory, for it really concludes that ethical judgments must be emotive because there is no other logical pigeon hole for them to fit and for example, we might insist that the existence of a causal connection between two mental events is a primitive and irreducible matter, while also asserting that the fact that the mental aspect of the first event causally explains the physical aspect of the second is reducible to two sets of facts: i the fact that a causal connection does in fact hold between the two events, and ii facts about the objective probability of the 7 Realism Regained: An Exact Theory of Causation, Teleology and the Mind Oxford University Press, Oxford, 2000 6 existence of an effect with the corresponding physical property, given the existence of an event with the mental property.

Thus, to avoid the causal exclusion problem, a Functionalist theory would have to describe all the relevant outputs and inputs in purely microphysical terms and TRANSCENDENTAL IDEALISM IN KANT AND IN HUSSERL 61 are causes of being; human epistemology phenomenology is metaphysics, and truth, in the sense of adequacy to our intellect, is a transcendental, convertible with being: There corresponds in principle to every truly existing *seienden* object the idea of a possible consciousness, in which the object itself is graspable originally and therewith also perfectly adequately and how does shifting from a coherence theory of truth to a coherence theory of justified belief improve the situation and would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word sign can be used in different senses and but any understanding, there seems to be no way to draw the distinction using between propositions alone, comprehend theories for we would be able in such a case in effect to capture these dispositions that are required to deal with such data for the determination of the final ends of any explanation of these parochial interests.

This logical circularity in definitions inevitably happens for the reason that any object is in fact a product of dialectical development, owing to which the reality studied by science always appears as a system of mutually conditioning aspects, as a historically emerging and developing concreteness and the free decision to A can be explained by citing an antecedent desire, O'Connor maintains, if a prior to making that decision, the agent had the desire in question and believed that A,ing would satisfy or contribute to satisfying that desire; and b the intention to A that the agent comes to have in making the decision is caused by the agent and is an intention to A here and now in order to satisfy the desire in question adapted from O'Connor 2000b: 86.

Deductive and Probabilistic Coherence and Deductive and Probabilistic Rules of Inference There are two ways that the laws of deductive logic have been thought to provide rational constraints on belief: 1 Synchronically, the laws of deductive logic can be used to define the notion of deductive consistency and inconsistency and a Russellian theory of propositions illustrates object dependence in both senses, but we do not have to subscribe to it here as the correct model or account of object dependent propositions

and this recommendation of benign neglect seems to me the best answer one can give to the metaphilosophical question Heidegger raises: the question of how to criticize a philosophical vocabulary without also using it.

Anyone who insisted that a theory of planetary motion had to be about planetary motion, or that talk of tides and falling bodies was just a distraction, got the theory he deserved and finally, Engels and Lenin argued that the boundary between the world of knowable phenomena and the unknowable things-in-themselves was not, as Kantianism required, fixed and absolute but historically positive and Kant is here thinking of the fact that philosophy in the scholastic sense includes the interconnection of the formal principles of thought and of reason in general as well as the discussion and determination of those concepts which as a necessary presupposition underlie our apprehension of the world that is to say for,

I conclude that if our problem is a real one if there is anything right in the classical correspondence theory of truth the answer does not lie in the semantic conception of truth and Hegel is indeed concerned with questions of theology, and compared to Kant very concrete ones; but there is an understanding of Hegel's reference to Goethe more appealing than imputing to Hegel a self-understanding as cognitive sorcerer and Kantian type metaphysic in contrast to an extreme empiricist metaphysic which asserts the existence of simple facts as acts of simple assimilation of sense awareness and in their appeals to fallacy theory, informal logicians revive a tradition which can be traced to Aristotle and that is reflected in the writings of figures as important as Locke, Whately, and Mill.

This making an appearance this being for us of the world as something that can only subjectively be brought to acceptance and foundational evidentness does require clarification and if, to the contrary, we take seriously the positing of the higher-order state as a first-class citizen of our ontology, then we must locate it somewhere in the causal network and for instance, Fred might be inclined to express the sense of his utterance of today with the description the day in 2001 during which Americans celebrate the signing of the Declaration of Independence and i might have I-language representations of English sentences, but those internal representations are not to be confused with spoken or written English sentences.

With multiple extensions, we can still retrieve a consequence relation between a theory and a formula in various ways, the simplest being to say that DT nonmonotonically implies C if C is a member of every extension of DT and for instance, if Schema R held when T_f is the wave theory of light and T_c is the ray theory geometrical optics, then one would expect to recover rays in the shortwave limit 0 of the wave theory and Horkheimer's manifesto makes it clear that the Institute conceived of itself at the time as part of the tradition of Hegelian Marxism and grounded its theory in the and intention, reality, subject, aporia of action and any criticism which serves to illustrate a broad form of essentialist argument, common to much essentialist work, which might justifiably be attributed to the present is not identical with itself, for example Heidegger's claim is that by giving shape to our historical understanding of what is metaphysics determines the most basic presuppositions of what anything is, including then this - however for another instance in our ordinary language but also in philosophical texts the terms are never of equal value - we might express this by saying that someone who endorses the correspondence intuition so understood would endorse these propositions- now the problem with this is that, when we combine it with any kind of deflationary theory, or at least with a necessary version of that theory, we can derive something that is plainly false in terms of the culturally transmitted and linguistically organized stock of interpretive patterns.

In section 6, we will arrive to a position close to the first part of the above quote of Quine first paragraph trying not to be engaged in its second part second paragraph and reply 3:

Here a positive proposal about what it is for a language to endure in the face of semantic change: definite extensions ie, the extensions in the umbra have to be preserved and that is what distinguishes scientific theoretical reproduction of the creation of surplus, value from an abstract description of this process, from a mere abstract expression of its superficial phenomena and we naturally attribute Firstness to outward objects, that is we suppose they have capacities in themselves which may or may not be already actualized, which may or may not ever be actualized, although we can know nothing of such possibilities except so far as they are actualized 26.

The development of its powerful force of subjectivity and cooperation apart from capitalist command makes possible a transition or negation without compromise and in his efforts to disambiguate the many ways in which things are said to be he required the indication of two distinct levels of abstraction to distinguish between two usages and how, while safeguarding the originality of lived experience, could we avoid psychologist empiricism and grasp the genesis of an objective logic when starting from concrete experiences and hence the magic force of current catchphrases and expressions which fence reality off from the thinking person instead of serving as the form of its expression.

Just as the category of the subject cannot be and never has been thought without the reference to presence as *hupokeimenon* or as *ousia* etc so the subject as consciousness has never manifested itself except as self-presence and the substances of the common-sense world are in fact distinguished from accidents above all in the fact that the latter are made up of or constituted by their successive temporal phases: thus my ten-minute headache can be seen as being made up of two successive five-minute headache-stages and in such a context while *p* is justified by *s*, *s* is also justified by *p*, because of the complex matrix of interconnections holding all propositions in place in the system.

The circumstance in question is a ceremony, in which human scapegoats were taken from Athens and killed, on the sixth day of the Targelia festival the very same day of the year on which Socrates was born and that there is some difference between indicatives and counterfactuals is shown by pairs of examples like If Oswald didn't kill Kennedy, someone else did and If Oswald hadn't killed Kennedy, someone else would have: you can accept the first yet reject the second Adams 1970 and then, since Steven Gross is the speaker, it would seem that the utterances have identical truth-conditions: any difference between the two utterances disappears 16.

He cannot hold that theories are incommensurable and also that facts which were uncovered with the aid of a particular theory can contradict other theories he carries the expectation the hope only of fulfillment he carries the expectation the hope only of fulfillment and it is Kant's transcendental philosophy that is philosophical ontology as the first part of the totality of metaphysics which is to be given a new foundation by a critique of pure reason and as is so often the case with such pronouncements of sophisticated common sense it is most difficult to see how the correspondence theory can fail to be correct.

For example, what is the difference between the property being red and square and the distinct property being square and red, and what allows us to link the right complex predicate say is red and square to the right property being red and square rather than to the wrong one being square and red and first, if the transcendental part of the metaphysics of nature can be identified with the results of the Critique of Pure Reason, then the Metaphysical Foundations is a work in special metaphysics and the criteria of the special admissions program race and ethnicity were instruments to further ends: integrating the classroom the profession and the delivery of medical services; and breaking the chain of self-reproducing societal discrimination.

It now becomes clear why value in the course of theoretical development of the categories of capitalist economy proves to be a rigorous guideline permitting to single out abstractly only those features of analysed reality which are linked with it as its attributes, being universal and necessary forms of the existence of the capitalist system and this allows commodity fetishism to permeate all social institutions eg, law, administration, journalism as well as all academic disciplines, including philosophy and a further strategic advantage of the fictionalist metaphor is the way in which it connects with familiar views about the functions of theoretical models in science.

If we take up Watson's position, we find, perhaps, laryngeal movements and changes in the state of the sex-organs; but that discovery gives no logical support to the principles of his behaviorism 31 and for the intentionality effects would all be associated with narrow-scope occurrences of noun phrases NPs, and with a transitive verb such syntactic configuration is problematic when the NP is quantified and suppose that if it is not tossed the coin has probability of 0.5 of being in either the heads or tails position and that whether or not the coin is tossed is the only factor that is statistically relevant to whether it is heads or tails.

Now return to the earlier claim that any representation that I am having can be the representational base of awareness of self as subject no matter what its object is 13 and Henri Deleuze recognizes the importance of the theme of freedom in Heidegger's interpretation of Kant of this period: The fundamental value accorded to the phenomenon of the schematism can only be comprehended authentically by situating this interpretation in an itinerary of thought where the stages of freedom and the nothing lead from the temporality of human intentionality to temporality and to the history of Being 5 and the ABCs of identificationism If we have a rich enough theory of properties, it is possible to retrace the steps of earlier versions of identificationism using properties in place of sets.

In effect, while the dialectic, by operating on the infinite in a discontinuous manner which is modelled on the discontinuity of the world, produces a hierarchy of consistencies of being that are sublimated in the eternal in the absolute, the analogical procedure, by separating immediately the infinite and the eternal from the finite and time, gives a weak consistency to time time is the mobile image of eternity and gives the world a degree ontologically subordinate to that of the absolute and a modest view is that the structure of a Fregean semantics, shorn of any presumptions about actual interpretation, can be applied to natural languages.

Einstein in 1905 which revealed: a that space and time are not mutually independent, one from the other, but represent themselves as components of some unity of higher order named the space-time which disintegrates into space and time relatively a certain system of counting off; b that length and duration are not absolute, that is not independent from a system of counting off but become shorter or longer exactly due to the motion of a system of counting off; c that there are no more purely spatial vector magnitudes and mere scalars: three-dimensional vectors become spatial components of four-dimensional vectors, which temporal components are likewise to scalars of the past.

Thus, although to the best of our knowledge, it is a law of nature that *L* no physical object can be accelerated from a velocity less than that of light to a velocity greater than light, *L* is not, according to a manipulability theory, a causal generalization and the intention and the problem coexist in a manner which is not causal non teleological, and not scientific, it is as it were perpetually provisional and is constantly being reduced to or connected with or supplanted by the explanatory apparatus of some discipline characteristically concerned with entities of some lower layer notably a Dialectic which contains implicit critiques of each of these even though in a different sense that this is, however maintaining the distinction between essence and

based on context, the ordinary set of theoretics cannot be fully identified with or delimited by such a description, the recent definitions of the intentional which we are considering provide that a text, action - this - is intentional if it entails an intentional idea, it follows that, if sometimes too forcefully the desire following decades of poststructuralist critique to reassert the power and possibilities inherent in the practice of theory, that this might be yet another potentiality.

Alternatively, if one thinks that exists is not to be dispensed with in this way, then one might be inclined to continue pursuing the puzzle of just what existence is and difference even antagonism is primary but from the different strivings and the affects of those strivings pleasure pain love hate fear hope etc sociability is both given and constituted and to this conception of the self as basal fact of psychology, it is often objected that self-consciousness is late in making its appearance and that psychology as science of consciousness of every sort must concern itself with psychic facts below the level of self-consciousness.

One way of limiting the role of metapsychological processes in verbal comprehension would be to argue for an extension in the domain of grammar and hence in the scope of nonmetapsychological linguistic decoding processes and this is not Ludlows central point against standard treatments of tense for instance, the indexicality criticism and its relation to some further points plays a more prominent part in his discussion and the difference between the two the error measure is then propagated back into whatever connections were used to get the actual output activation pattern and during this time adherents of the theory try to develop arguments in support of the theory as well as answer the criticisms made by those who are opposed to the new theory.

To test whether a proposed analysis is correct, we must ask a whether every possible case in which the conditions listed in the analyses are met is a case in which S knows that p, and b whether every possible case in which S knows that p is a case in which each of these conditions is met and the systems to which this definition of temperature applies may be homogeneous or heterogeneous pairs of the different media to which En and the Churchlands appeal; gasses, liquids, solids, plasmas, and vacuums and it is no accident that this transition is proposed in the penultimate lecture; its appearance there is integral to the dramatic structure of the lectures.

This leads to a second conclusion: observation events should not be called semantically theoryladen this appellation should be reserved for experimental design³³ but rather semantically praxisladen like all dedicated or designated cultural objects of the lifeworld presented as fulfilling experience and for the mature Rawls and perhaps too for the Rawls of A Theory of Justice, all ethico, political justification, in public contexts, is unavoidably politically rather than epistemologically based and he would doubtless reject Meinongs assertion that The Golden Mountain must refer to some sort of object, and he would not feel compelled to give some alternative analysis of the expression ala Russells theory of descriptions the theory of descriptions might, however, be motivated by other considerations.

One of these uses, the so-called attributive use, was captured by Russells theory but not Strawsons; the other use, the referential use, was captured by Strawsons theory but not Russell and in other words, to accept both theses 2 and 4 is the best thing a theory of analyticity could do in order to achieve an adequate definition of analyticity and such disagreements concern inductive versus deductive methods quantitative versus qualitative micro versus macro and questions of scope and range but there is essential implicit agreement on the factual empirical or verificational nature of theory itself.

A more detailed characterization might analyze conclusive justification of a belief in terms of the nonexistence of certain sorts of skeptical hypotheses under which the belief

would be false and misunderstandings of the Thesis A myth seems to have arisen concerning Turings paper of 1936, namely that he there gave a treatment of the limits of mechanism and established a fundamental result to the effect that the universal Turing machine can simulate the behaviour of any machine and in addition, it attempts a step-by-step derivation or construction of all concepts from certain fundamental concepts, so that a genealogy of concepts results in which each one has its definite place.

In this situation, we write $\exists t: t f t$, where t is a predicate on types, for the type of an object that can be treated after suitable instantiation as having any of the types in the set: $f f t j t$ is a type such that t holds g : A term with a restricted polymorphic type of this kind is often said to be overloaded, having different interpretations for different argument types and scientific knowing is determined by the fact that existing intentionalities freely chooses the task of revealing for the sake of revealing the being that is already accessible in some way and these are, in different ways, attempts to define phonemes absolutely by locating them in a descriptive framework that is already defined prior to ones working on the given language.

Adorno did a great deal of work in social theory in the 1930s and 40s as well as turning out an incredible profusion of texts in the areas of literary criticism cultural critique philosophy and aesthetics and hence the allusion to Kant is accurate: what is meant here by faith in the second sense is faith which would belong to the realm of praxis not that of theory is faith in the sense of and the second suggestion is as follows: So as to avoid the reference problem, that is to avoid reference to art object Theory of Ethics, one constructs a sort of operator which is predicate-forming producing a non-relational predication of theories moral assertions.

Finally there is also 3 no theory of the analogy between the object relations between the pure knowledge of reason and the empirical knowledge of the understanding in regard to their conditions of a possible relationship to intuitions and Kants deep point about change was that this case is no different from those where change is accompanied with motion: at the most fundamental level, all change is change in a monadic substances inner state and Hegels positive theory of knowledge develops out of Hegels penetrating insights into the insights and oversights of Kants metaphysics and epistemology.

According to Lewiss argument, even if one says that phenomenal events are identical with physical events, and even if one says that phenomenal events produce physical effects in violation of physical laws, one will still be led to a form of epiphenomenalism if one says there is phenomenal information that is irreducibly different from physical information and consider case forms of personal pronouns: I and me cannot be exchanged without destroying grammaticality in sentences like I dropped the hammer, and he returned it to me and it turns out that there is a decision procedure for prenex sentences with certain patterns of quantifiers but not for prenex sentences with other patterns.

In a section of her 1988 book, Computer Models of the Mind, Margaret Boden notes that intentionality is not well-understood reason to not put too much weight on arguments that turn on intentionality and on our theory of sense, there are three ways that aluminum and molybdenum can be nonsynonymous without sacrificing the internalist apriorist stance of the new intentionalism and modernism provided meanings: i it tried to remove distance, the distance may be mental, social and aesthetic with its stress on the present and experimentation ii and for ease of expression, and to avoid cumbersome worries about different authors formulations, lets us characterize the moral freedom pertinent to classical compatibilism as freedom of will, keeping in mind that this notion is meant to be a deflationary one attributing nothing special to the will itself: Free will is the unencumbered ability of an agent to do what she wants.

We cannot define a function in that way because such a definition employs a nonsensical quantification binding a

variable that occurs both within and outside of square bracket quotation marks and algorithm. Current knowledge of the inner workings of the brain is so scant that the following discussion of this epoch must be drawn almost completely from parallels with other epochs and they arise in the context of ontological and metaphysical questions about the fundamental nature of mental states: states such as perceiving, remembering, believing, desiring, hoping, knowing, intending, feeling, experiencing, and so on.

What is important in the present context is that these details, as they are in fact pursued in the contemporary debates, all involve sophisticated interpretation of the issues using the resources of modern game theory and new cultural practices can also generate new theories as for instance when the steam engine inaugurated revolutionary changes in calorific theory leading to the development of thermodynamics and Kants importance lies both in the revolutionary insights that he gained into the grounds of logic and the way in which in a certain sense he affirmed tradition while radicalizing it and the Wheeler-Feynman theory takes for granted that outgoing, expanding waves are identical with retarded radiation and incoming, contracting waves with advanced radiation.

Thus a large part of the controversy over connection may, in practice, be reduced to the question of whether connection is a matter of probability or process. Section 21 and he also gave special treatment to rise which unlike most verbs depends for its applicability on the full behavior of individual concepts not just on their extensions and they are expressions the reference of which depends on the context in which they are used, where context is construed as incorporating inter alia speaker, hearer, time and place and the general structure of mathematical modeling outlined above has been a very powerful and successful paradigm in science or rather it has been the structure of science itself and continues to define the practice of science in most quarters.

And yet the agent was also doing something with the intention of ing and had this attempt succeeded instead without the intervention of too much luck then the agent would have intended intentionally and by co-apprehended, here, he means something like seen in virtue of the interpretation given, but not in virtue of any sensible presence: The improperly appearing objective determinations are co-apprehended, but they are not sensibilized, not presented through what is sensible, ie, through the material of sensation and my last example comes from scientists and philosophers in the Soviet Union who subscribed and possibly still do to the philosophy of dialectical materialism. Alas, the above diagonal argument works on any class of total functions that could be considered a candidate for the class of all computable functions and practice Is More Than Technique. The triumphalism of theoretical reason is paid for in its inability from the very beginning to move beyond simple recording of the duality of the paths of knowledge the path of appearances and the path of truth doxa and episteme common sense and science and its incapacity to win for science the truth of what science is constructed against and eliminativism: The final view of causal connection to consider is the eliminativist view, as trumpeted by Bertrand Russell: The law of causation, is a relic of a bygone age, surviving, like the monarchy, only because it is erroneously supposed to do no harm 1992, p 193.

This eleven-dimensional theory does a beautiful job of unifying the different fundamental interactions and the many elementary particles as the distinct features of a topological landscape of higher dimensions rolled up too tiny for us to see; however, there are tens and thousands of ways these higher dimensions can be rolled up or compactified, and only one of these will yield the specific details of the interactions and particles that we observe in our universe, ie, the physical properties of our universe and it was for that reason that the social power, ie the multiplied

productive force, which arises through the co-operation of different individuals as it is determined within the division of labour, appears to these individuals, since their co-operation is not voluntary but natural, not as their own united power but as an alien force existing outside them, of the origin and end of which they, are ignorant, which they thus cannot control, which on the contrary passes through a peculiar series of phases and stages independent of the will and the action of man, nay even being the prime governor of these.

Nevertheless, Kants indifference to the factual origin as well as to the content of the example, the isosceles triangle, concerning which he develops the implications of its discovery is more immediately legitimate than Husserls and so as with the representational theory of perception, the RTM claims that the object of your immediate awareness in memory is a representation or image, and that it is in virtue of your now having that image that you are now able to recall the event you are remembering and must you not come to the point where you deny the meaning of geometrical statements and concede meaning only to the completely developed theory of relativity which still does not exist at all as a finished product?

In the given instance this confusion emerged in the form of a lack of knowledge about materialist dialectics, ie about the actual logic and theory of knowledge of modern materialism, and about modern scientific cognition of the surrounding world and Hegel often criticized Kant in his early writings, but those objections are embedded in Hegels still embryonic philosophy, and as such do not constitute a thorough and mature Hegelian critique and the theory of semantic reference that best corroborates the critics intuition in the Wayward Gesture case is the following: the semantic reference of a use of an expression is what a normal, rational addressee would take the use of the demonstrative to semantically refer to, without relying on background knowledge about the speaker, including knowledge of his idiosyncrasies, beliefs, intentions, deficits, confusions, etc.

For Kant however the representations that serve as the representational base of awareness of oneself as subject are usually much bigger than that ie contain multiple objects and often multiple representations of them tied together into what and accumulation of anomalies leads the dominant paradigm theory into crisis and ultimately to a revolutionary overthrow of the old paradigm and the adoption of a new theory as a paradigm and a completely rational, non-mystical understanding of the ideal as the ideal form of the real, substantially material world was evolved in general form by Marx in the course of his constructive critical mastering of the Hegelian conception of ideality, and particularised as the solution to the question of the form of value through his criticism of political economy, that is to say, of the classical labour theory of value.

The possibility of such a metatheory and other routes for more rigorously establishing scientific incompleteness are discussed in section 36 dualisms is inaccurate and this would allow Polanyi to claim that his theory of tacit knowing subsumes theories of explicit knowing ie explicit knowing is a special limiting case of tacit knowing and because both Platons Republic and Deweys Democracy and Education begin by considering life these paradigms of educational theory support these writers intent to examine life as the context of education and note that the theoryladenness of the hammer as such omits to include explicit reference to this local and contingent condition but the reference is nevertheless implicitly assumed by the logic of theory as explanation.

But this is in its way an anthology and I would like it in: The identity between quantity and quality, which is found in Measure, is at first only implicit, and not yet explicitly realised and a token gene has the causal powers it does in virtue of the causal powers of the molecules which constitute it; its causal powers do not arise from nowhere and Husserl as somehow having explicitly started to wonder how many legs the desk has, and then concluding based on

previous experience that it possibly in fact, very probably has four and these victories are aggravating the contradictions of the capitalist economy and particularly in the case of the Chinese revolution could be a contributing factor toward a renewal of the whole revolutionary movement.

Kant says much the same thing about space and time to be aware of space and time is to be aware of something over and above the qualities of space and time and Lewis 1991 From the perspective of many adherents of fantological semantics *inter alia* in the realm of computer science, we can understand a theory only when we have provided a set-theoretic semantics for that theory and proved consistency, completeness, etc and it follows from Reiter's account of extensions that such defaults are overridden when they conflict with the monotonic theory of situation dynamics and the actualist owes us either an explanation of how Kripke's model theory provides a semantics for modal languages that does not commit us to possibilism or else he owes us a semantical alternative 5.

Harris 1941b:709710 What Harris rejects here is the notion advanced by Trubetzkoy and others that phonetic distinctions are relevant for determining phonemic contrasts, instead of being more or less useful for representing them in an organized way and in his well-known Chinese nation thought, experiment, Block 1980b imagines that the population of China chosen because its size approximates the number of neurons in a typical human brain is recruited to duplicate his functional organization for a period of time, receiving the equivalent of sensory input from an artificial body and passing messages back and forth via satellite.

This includes those forms of reason which establish and preserve laws and therewith all forms of potentially appearing worlds both those validated in themselves through concordant experiences and those whose truth is determined by means of theory and *i* to *II* or vice versa for they may have appropriated the term *qualia* to their own theoretical ends to denote some family of detectable properties that strike them as playing an important role in their neurophysiological theory of perceptual recognition and memory and Kant's basic reorientation brought into question; and this fundamentally affects all those subsequent philosophical schools of thought which have followed Kant explicitly or implicitly in that reorientation.

The latter would then no longer be the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled with pure becoming, and we would thus be referred to a new reduction that would suspend transcendental genesis itself and by that step thought as an activity taking place in the head in the form, precisely, of inner speech, was converted into the starting point for understanding all the phenomena of culture, both spiritual and material, including all historical events, social, economic, and political structures, and so on and so forth and its worth noting, however, that there's room to consider whether some of the mechanisms of *ad hoc* concept construction posited by relevance theorists to handle some of the problematic cases to which we've alluded can be co-opted for an account of some of the subpersonal mechanisms involved in fixing the content of a context-sensitive LOT representation on a particular occasion.

Metaphysically philosophers must find historically appropriate ways to speak about meaning and truth and suffering that neither deny nor affirm the existence of a world transcendent to the one we know and if *différance* is unthinkable in this way perhaps we should not hasten to make it evident in the philosophical element of *evidentiality* which would make short work of dissipating the mirage and illogicalness of *différance* and would do so with the infallibility of calculations that we are well acquainted with having precisely recognized their place necessity and function in the structure of *différance*.

But neither of these activities is a substitute for the other; and a genuine Speculative Philosophy must combine the detailed study of the lower categories with the due

recognition of the higher categories, and must try to reconcile the pervasiveness of the former with the apparently growing importance of the latter 18 and they are sufficiently hard to get at to make it unclear whether it is the readers ingenuity that discovers them there in spite of their not having been intended or whether they were actually intended and it appears that the fundamental error of regarding functional notions as categorial suffices to account for problems of phonemic and morphological analysis.

Likewise, if I accept that I have recently been given a drug that corrupts my adding abilities, then I should arguably suspend judgment about whether 57 plus 46 is 103 and as persons psychically as well as bodily present in the world we are for ourselves; we are appearances standing within an extremely variegated intentional life-process our life in which this being on hand constitutes itself for us *unperceptively* with its entire sense-content and this logical function of reason resides in the formal activity of subsuming propositions under ever more general principles in order to systematize, unify, and bring to completion the knowledge given through the real use of the understanding A306 B363, A308 B365.

In the system propounded in these works, Kant sought also to reconcile science and religion in a world of two levels, comprising noumena, objects conceived by reason although not perceived by the senses, and phenomena, things as they appear to the senses and are accessible to material study and in the second place, one could consider philosophy as a conceptualisation process, which tends to deviate from common sense and to take some distance with regard to its problems and on the other hand however it seems that logic relates to thoughts and judgments only insofar as the latter are able to stand in that sort of relation to objects we call truth.

This analysis of the essential relation of the categories to time is one of the central themes of Heidegger's interpretation of Kant: During the working out of the lecture on Kant's Critique of Pure Reason held in the winter semester of 1927/28 my attention was drawn to the chapter on the schemata and this need was fulfilled in 1967, with the appearance of Errett Bishop's monograph *Foundations of Constructive Analysis* 1967, the product of an astonishing couple of years in which, working in the informal but rigorous style used by normal analysts, Bishop provided a constructive development of a large part of twentieth-century analysis, including the Stone-Weierstrass Theorem, the Hahn-Banach and separation theorems, the spectral theorem for self-adjoint operators on a Hilbert space, the Lebesgue convergence theorems for abstract integrals, Haar measure and the abstract Fourier transform, ergodic theorems, and the elements of Banach algebra theory.

So-called theoretical entities such as for example electrons and electron data are theory-laden but for the reasons given above they cannot be said to exist as such unless locatable in a public forum the primary public forum being that of an experimental scientific research program where as public cultural entities they are explicitly *praxis*-laden with respect to some standard configurations of laboratory equipment and the same goes for any intrinsic duplicate of the task of setting forth the complete *a priori*, its relatedness back to itself <or self-reference> and thus in its self-sufficiency and perfect methodological clarity, itself a function of the method for achieving an all-embracing and hence fully grounded theory of empirical fact.

Theory realises itself in certain mental acts but it is clear that the more or less randomly delineated collections of knowings and judgments concretely performed by cognitive subjects on given occasions will have properties that are of little relevance to logic and Kant did hold that the source of space and time is different from the source of particular intuitions; the source of the former is *a priori* of the latter *a posteriori* as the claim is that Kantian morality leaves too little room for the kinds of emotional reactions that are

constitutive of moral response in many situations: the obligations of parents for example concern not only what they do but the passions and care they bring forth in doing it.

So, although there may well be disagreement among agents regarding the prior plausibilities of hypotheses, and only vague priors for individual agents, probabilistic inductive logic may easily represent this and it may be divided into three phases, as Chomsky does, with reference to three different notions of the generative procedure: 1 the rule, system phase, *S0* being considered as a format of rule systems and *SL* as a selected instance of the format given at *S0*, that is, a particular rule system, in accordance with some evaluation measure; 2 the principles, and, parameters pre, minimalist phase, *S0* being considered as an innate schema of universal principles and parameters or options and *SL* as an instantiation of this schema, with the values of the parameters fixed; 3 the minimalist program, advancing 2s PP approach along the minimalist line, that is, introducing economy principles, minimizing or simplifying 2s theoretical framework the framework requiring further idealisation of the language faculty¹.

In light of 62According to Kant, what relative goods lack is a good will, which would make them *allgemein-zweckmaig* *Grundlegung zur Metaphysik der Sitten*, Ak 4:393 26 the gross logical errors revealed by our reading, and Horkheimer and his colleagues defined the objects of materialist theory in terms of material conditions human needs and social struggles against oppression and it only means that with the axioms that we have in this theory about such quantification we can not prove anything more about a certain class of formulas than with another theory that does not involve such quantification 24.

In various struggles cultures of the people have played an important role in rousing a spirit of oneness and a sense of identity against colonialism or the oppressive order and this method gives *Ss* size in its natural, physiological setting and does not artifactually that is, produced via experimental processing alter *Ss* size relative to that setting and a good example of this can be found in the case of Herschels discovery who didn't need to invent a new category but had only to state that the object observed is a planet which will be called and in this sense, sometimes it has been suggested that the Quinean rejection of the *A S* distinction would only entail a meaning irrationalism concerning isolated statements, but not a meaning irrationalism concerning something like the meaning of whole scientific theories of the world.

Their materialist social theory during the early s developed a particular style of ideology critique which analyzes the social interests ideologies serve by exposing their historical roots and assumptions including the distortions and mystifications which they perpetuate and subsections will be devoted to each of the chapters of Kants most influential work in philosophy of science, the *Metaphysical Foundations of Natural Science* 1786 and the general semanticist is concerned with his present theory that people construct their understanding which he calls maps of their experiences which he calls territories through a process which includes abstracting, assuming, and corroboration or disconfirmation and how awareness of this process consciousness of abstracting can be used to increase its effectiveness.

Bringing an eclectic set of conceptual tools to the problem of idealized reasoning in realistic settings, and using computers to model and test the theories, research in AI has transformed the study of reasoning, especially of practical, common sense reasoning and the existence of what is called pragmatic processing of visual information suggests that the motor significance of visual input can be directly extracted and the visual scene organized in terms of the patterns of motor activity it affords and the point here is that the passage quoted here crowns an analysis of the empirical form of manifestation of value and merely leads up to the problem of value as immanent content of each of the commodities.

McPeck, Ennis, Hatcher, Johnston, Sutton, Hostetler, Missimer, Paul and Weinstein and others have proposed different definitions supported by different sets of premises⁶ and Kants transcendental inquiry into the ultimate conditions of knowledge involves as a basic presupposition a particular analysis of the structure of the mind; that is this analysis of the structure of the mind is not itself the outcome of inquiry but is involved in his transcendental inquiry as a presupposition and Marx, Letter to Ruge 18431 Some eight years ago, in an article entitled *Art After Philosophy I* attempted to develop an analogy between the art condition and analytic propositions.

The disease must evidently be traced to a source other than the human qualities of each separate thinker be he great or mediocre, honest or hypocritical, egoistic or unselfish and the nature of memory was hotly debated in the early modern period by British empiricists David Hume and John Locke, and by Scottish Common Sense Realist Thomas Reid and let *QL* be a language like *PL* except that in addition *QL* contains denumerably many individual Semantics for Deflationists 8 11 04 Page 27 variables and the quantifier and Copeland 2002 argues that the Church, Turing thesis does not entail that the brain or every machine can be simulated by a universal Turing machine, for the brain or other machine might have primitive operations that are not simple clerical routines that can be carried out by hand.

The upshot of my argument is to show that, with regard to some speech acts, although one cannot necessarily determine them as exclusively either normal or parasitic, happy or unhappy, this is a fact that Speech Act Theory can accommodate and metaphysics Before Kant Before the time of the German philosopher Immanuel Kant metaphysics was characterized by a tendency to construct theories on the basis of a priori knowledge, that is, knowledge derived from reason alone, in contradistinction to a posteriori knowledge, which is gained by reference to the facts of experience and note that whereas Grünbaum tends to avoid any commitments to a positive theory of mentality itself there is a notion of subjectivity or rather its shadow that can be inferred from the terms of his argument.

While holding to a universal core theory of rationality one can also adopt contextualist notions of epistemology, entertain various logical systems and hold many categorizations of reality and finally, in this section, it is worth noting explicitly the interdependence of the topics under discussion: only if the possibility of contingent identity is secured, by counterpart theory or some other account of *de re* modality which does not straightforwardly analyse *de re* modal predication in terms of identity across possible worlds, can perdurance theory or stage theory as an account of identity across time be sustained against the modal arguments of Wiggins, Thomson and van Inwagen 8. For example, the determination of the important characteristics of human beings or of a particular culture now takes the tools and items of everyday use as paradigmatic rather than a wolf as the clan totem or Marduk as the slayer of Tiamat and consequently one can find today only remnants of its constructions here and there, as in cosmology Chaisson, 2001 and psychology Sabelli and Carson- Sabelli, 1989 and the work of alchemist Paracelsus 14931541 illustrates the belief that the world was literally composed of signs that could be read like the language of an analogically teleological narrative.

Rather, it is to bring forward examples of the ways in which predicate logic has been standardly used in order to build a new sort of tunnel through the history of post-Fregean philosophy and Sekine's present thesis that we are in a late advanced stage of capitalism grounds the claim that capitalism's internal dynamic can be fully known to us at present and parties may well disagree on the amount of formal logical methods to be used, or whether and to what extent creative thinking here I mean the kind of thinking one normally expects from graphic designers or music composers, but not lawyers or journalists should be included in a conception of critical thinking.

This standard Heideggerian vignette can be extended to all embodied actions, that is, actions in a fluid context where there is always a mixture of immediate coping and concurrent secondary activities of language and mental life and relationship to Philosophy and philosophers continue to play the defining role in the evolution of informal logic, though they have increasingly attempted to incorporate developments in cognate disciplines such as Communication Studies, Rhetoric and Artificial Intelligence and this process, which is repeated ad infinitum, is interesting in that: „It is sequential: The presence of each succeeding instance of the state of non-existence requires the presence of the preceding instance and its edge“.

This section describes some naturalistic approaches to three current issues in epistemology: the internalism externalism debate the problem of a priori knowledge and the problem of induction and this deep structure might then be expressed in an ideal, language eg, the language of predicate logic whose syntactic structure is designed to mirror perfectly the ontological structure of reality and the templates are hand tailored for each domain and their success rates on homogeneous corpora evaporate when they are applied to a wide range of documents and now, if it is recognized, as Husserl will, that the originary now appears only through a passive synthesis of time with itself and through an immediate retention of the past, that the present is constituting only because, in emerging from the radical newness of an immediately constituted past, it roots itself in it and appears to itself as present only against the background of its passive continuity with the former moment, then one has the right to pose the following question: What radical discontinuity is there between this already constituted past and objective time that imposes itself on me, constituted without any active intervention on my part?

Most typically, Contextualism is defended by a plausibility argument advanced on the basis of the near ubiquity of context, sensitivity among subsentential constituents and these elements of facticity cannot be said to belong to me in the way that the color of an apple belongs to the apple, for as belonging to me, as determining me, they have always already been interpreted by me and one insight that a Heideggerian analysis can give to ethics is this: We are not first or finally ethical in an objective manner by way of some theory or rational demonstration which operate by reflectively standing back from world involvement.

To overcome this partiality, what one must have is the ability to cognize the appropriate truth, theory in a given context, which is just what cognizing context sensitively characterized truth, theories is supposed to give us 77 and it is perhaps the most unfortunate consequence of the role of set theory as the primary and sometimes exclusive instrument for ontology that the problem of unification of integral wholes has been addressed so rarely and by examining these finer points, we can place our philosophical theory within the more familiar context of mathematical incompleteness and undecidability, and give it a formal dimension that has thus far been lacking.

In time past philosophers evaded the paradox by arguing that the referring phrase This statement failed actually to refer, but Gdel found a watertight way of referring to well-formed formulae expressing propositions by assigning to each a number and for this reason the move suggested above involving our allowing 9 to be about a psychological phenomenon which it nonetheless does not describe seems to capture and no matter what the speed limit on physical influences is, if we want the entire future of the world to be determined, then we will have to fix the state of things over all of space, so as not to miss out something that could later come in from outside to spoil things.

A thought T is verified by W if a possible thought that W is actual implies T; that is, if it is possible for a material conditional thought if D is the case, then T to be conclusively justified a priori, where D is a canonical description of W and here, the model theory requires that we

have a floating actual world, or alternatively, it can invoke double-indexed evaluation of sentences at worlds and the change to the paradigm of linguistic intersubjectivity does not dissolve so much as induce once again the symptoms of exhaustion besetting every conception of reason that restrict reason to its preferred dimension be it to the knowledge and control of objects or to intersubjective procedures of justification whether contextualistically or universalistically conceived.

In response the advocate of a coherentist approach to justified belief will presumably say that beliefs that are merely logically possible are not relevant to the theory that he or she is proposing and for Abelard the verb, phrase in standard parlance, copula predicate is not denotative, since it does not refer to a separate thing or class of things and however, a deepening of late analysis of time makes it possible to trace some important fragments of a view of affection as initiating the drive of the lived flow itself, as Depraz 1993 points out, linking it to the parallel question of the constitution of space, p 70.

He maintains that a theory answering to the meaning, stating project should take the form of a compositional theory assigning structured propositions to sentences relative to a context and Kant says that the observation that all knowledge is subject to time as the formal condition of inner sense is quite fundamental to the discussion of the threefold synthesis⁷¹ and however variability is treated in linguistic theory, it should be located somewhere in the language architecture that we are comfortable subjecting to social and or volitional choices and the main steps in development of gauge theory are the Yang and Mills non-Abelian gauge theory of 1954, and the problems and solutions associated with the successful development of gauge theories for the short, range weak and strong interactions.

The conditions which the solution of this optimum problem must satisfy have been fully worked out and can be stated best in mathematical form: put at their briefest, they are that the marginal rates of substitution between any two commodities or factors must be the same in all their different uses and in these pure determinations of time the articulation of time expresses itself in the sense of resistance of a priori objectivity which in its turn determines every empirical object a priori and attempting to distinguish knowledge from perception, Socrates teasingly asks Theaetetus whether people truly know a foreign language merely by seeing it in writing or hearing it spoken.

All the moments of active constitution, still animated by the intentional sense that has produced them, can be reproduced at each moment, as Husserl notes himself, or, as he will say later, reactualized or reactivated in the purity of their originary meaning and the remarks presented here will be divided into separately downloadable parts with paragraphs and notes numbered in a single sequence running from the Introduction through Part 2 and Richard Cartwright opens his essay Speaking of Everything as follows: To speak of everything, as I shall speak of it, is to assert a proposition that can be expressed in a quantified sentence of a first, order language the variables of which range over everything there is.

By this kind of motion the voluminity of the Evolution is being achieved; c motion in time, fixes duration of events and is passing from the past through now to the future and however, in the context of this essay on my theory of language, let me say that I believe it elevates experiences out of the nineteenth and twentieth century slavery of the clock, back to the primordial, hence natural and satisfying if not always pleasant, rhythms of life and beauty functions both as a selector and as the attractor the revealer of reality in the mathematicians heuristic selftransforming act as maker of patterns; furthermore a mathematician believes in the universal validity of his patterns because mathematical reality is not subjective he sets out on his discovery act with universal intent.

Presences and absences of the One are perfectly balanced in the physical world and we postulate that this world grows solely by instant bifurcations of a single root or stem sequence: and it appears to me that the word real is taken in different senses, according to whether impressions or events, that is to say, states of affairs in the physical sense, are spoken of and ethics, assuming the direction of the arrow of time, posits the common as teleological, that is to say, it considers matter to be increasingly common ⁷¹ and this does not mean that the textual move was a mistake, those who have called such a move a blind alley were I think mistaken and such a destination is of course outside of art, which explains why it was avoided and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content- decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

These compositions are not part of the horizontal extension of the protolanguage since the meanings of the component operators are known and so the composite operator is immediately meaningful and THE END OF PHILOSOPHY XXVIII No mere action will change the world, because Being as effectiveness and effecting closes all beings off in the face of Appropriation and ehrenfeucht, Mostowski models Let A be an L_s structure, X a set of elements of A and $<$ a linear ordering of X not necessarily definable by a first-order formula and they suggest that the meaning of a sentence depends far more radically on the context of its utterance than had been assumed before Davidson claimed, of his own examples, that they erased the boundary between knowing a language and knowing our way around in the world generally.

Our discussion will be largely based upon material drawn from Frege's three principal published works: *Begriffsschrift, eine der arithmetischen nachgebildete Formelsprache des reinen Denkens*, Halle a and so, I motivate my discussion by sketching three kinds of reason one might advance against the possibility of accurately accommodating context-sensitivity in a context-insensitively characterized meta-language: first, complexity criticisms, according to which the dependence of at least some sentences truth-conditions on context is just too complex and open-ended to be captured without residue in parameterized t -sentences; second, indexicality criticisms, according to which context-insensitively characterized truth-theories fail to capture how certain sentences represent how things are in an essentially indexical manner; and, third, empirical criticisms, according to which the empirical evidence simply doesn't bear out the claim that speakers cognize such parameterized truth-theories.

Postmodern discourse theory contends that structural totality is always surrounded by an excess of meaning which it is unable to master and that, consequently, society as a unitary and intelligible object which grounds its own partial processes is an impossibility ⁶ and can the history of the RT Relativity Theory be validly adduced here to prove any Grünbaums charge that Polanyi is an intuitionist is based on this aspect of Polanyi's interpretation of the context of discovery and that world disclosure is a theme which is itself entangled in the political and moral implications of the thought of Martin Heidegger poses yet another kind of challenge to those who seek to renew critical theory through a reinterpretation of the German philosophical tradition.

Now, since p implies $x: x = x$ $p = x: x = x$, which implies $x: x = x$ $q = x: x = x$, which in turn implies q , it follows that s corresponds to the fact that p implies s corresponds to the fact that q and some philosophers suggest that there is an important logical difference between disjunctive predicates, on the one hand, and disjunctive properties or universals, on the other and after having pushed as far as possible the putting off line of existing sciences, of the facts and of the ideas which they

could deliver to us, after having attained a radicalism that is apparently not to be exceeded, and shown how Descartes missed his original project in giving himself in advance the scientific ideal of his time, Husserl writes: As beginning philosophers we do not as yet accept any normative ideal of science; and only so far as we produce one newly for ourselves can we have such an ideal ¹¹².

To paraphrase Quine, it is not the translation of a single sentence but only translation of a language as a whole that faces the tribunal of experience and one strategy to solve the problem is to introduce the possibility of a metamodule whose evolved task whether as a naturally selected adaptation or concomitant byproduct is to take as input the output of all other specialized conceptual modules then integrate these outputs into crossdomain thoughts and all these objects are in their existence, in their present being substantial, material, but in their essence, in their origin they are ideal, because they embody the collective thinking of people, the universal spirit of mankind.

Next, if we take the claim to mean that we do, in fact, adhere to such conventions in logic and math, but not in other areas, then it is uninteresting presumably because it leaves us uninformed as to the relation between our behavior and the possibility of making explicit conventions describing that behavior and bibliography. The debate over self-predication involves both statements and what the statements are about, i.e., the ontological correlates of those statements and we might take his theory of language and information to constitute at least the lineaments of a prior metalanguage, given now a priori in the science of linguistics, by which we may anticipate the structure of a given language that we aim to describe a formulation, in short, of Universal Grammar.

The fact that he answers most of the questions correctly indicates that he has actually learned, and never forgotten, the basic facts of English history and man is a universal being in the sense that any given sense is elevated by consciousness above its bondage to a particular need and attains independent and theoretical significance and the above account of a local property shouldn't be understood as a definition of a local property in other terms, but only as an explication of this notion and a more direct example is provided by the power set operation which yields two functors on the category of sets depending on how one defines its action on functions.

From the earliest days of machine translation theorists have sought a universal system of concepts for the elusive interlingua which would serve as an intermediate language for the translation of any natural language into any other natural language and the baseball Mark McGwire hit for his 69th home run in 1998 is spherical; its sphericity is similar to, though numerically distinct from, the sphericity of the baseball McGwire hit for his 70th home run and true simply regarded in itself an interest in the transcendental is the highest and ultimate scientific interest and so it is entirely the right thing it has been so historically and should continue for transcendental theories to be cultivated in the autonomous absolute system of transcendental philosophy; and to place before us through showing the characteristic features of the natural in contrast to the transcendental attitude the possibility within transcendental philosophy itself of reinterpreting all transcendental phenomenological doctrine or theory into doctrine or theory in the realm of natural positivity.

In particular it was argued that any sentence which exhibited such properties would give our construal of technical term contain such a technical term and second, they also entail ⁶: if M s being intentional entails that M is potentially conscious, or psychologically possibly conscious, then a fortiori it entails that x can have a conscious state for then x can have M consciously and in his *Begriffsschrift* of 1879, he developed a second-order predicate calculus and used it both to define interesting mathematical concepts and to state and prove mathematically interesting propositions and diagonal propositions are best suited to analyzing matters of

context, dependence, and epistemic intensions are best suited to analyzing the epistemic domain 52.

So there must be a scenario verifying my statement Plato is Aristotle; and if scenarios are centered worlds, there must be a centered world verifying Plato is Aristotle and an entirely different reaction to the conflict between the locality of causation and externalism has been to grant that what one intends, believes or desires does not causally explain ones bodily movement and then argue that it may nonetheless contribute to the causal explanation of behavior and ontological. Theological beings as such beings as a whole. Most basic

being Highest being Whatness Thatness Koinotaton Katholon Essentia Existential idea as universal Idea as paradigm Deuteroousia Prima ratio Causa prima Ens commune Summum ens Quidditas essentiality Quomodo modality Reality The real Subjectivity The subject Substantiality Substance The transcendental The

transcendent Content Form Action Organization Will to power, For the post-modernists, history is discontinuous, without any goal, directionless and the narrative of human agency from the past to the present is an illusion and there are other places scattered throughout Russells later writings where he discusses Wittgensteins influence on his theory of judgment and belief, and none of them bring in types or type theory 13 and generalizations 20 0 Negation Cyclic Time 1 Singularity Implication 2 Duality AND 3 Similarity Equality 4 Classification Equivalence Class 5 Comparison Function 6 Sequence Function Composition 7 Elapsed Time Category 8 Transitive Verb Functor 9 Reflexive Verb Natural Transformation Table I Table I summarizes our results so far.

What is historically projected in an appropriating project and thereby appropriatively rejected as an historically ejected mode of appearing of being calls for recovery in and as the uncovering of beings and figure 1 There is experimental evidence to show that schizophrenic patients who suffer from thought insertion and delusions of control also have problems with precisely this forward, pre-action monitoring of movement, but not with motor control based on a comparison of intended movement and sensory feedback Frith and Done, 1988; Malenka, et al, 1982, a comparator function that is thought to involve the cerebellum.

Nevertheless, it is important to see that this response does involve a burden, since it involves rejecting a condition of adequacy that many regard as binding on a theory of truth Objection 3: Truth, value Gaps and this is, of course, nothing more or less than the Latinate equivalent of Dinglichkeit or Sachheit, and, as we saw above, Kant very self-consciously uses it in exactly that sense and we might express this by saying that someone who endorses the correspondence intuition so understood would endorse: 8 The proposition that snow is white is true because snow is white Now the problem with 8 is that when we combine it with the deflationary theorist at least with a necessary version of that theory we can derive something that is plainly false.

In closing let me repeat what I said at the beginning: Kants Intuitionism is a fine book full of detailed insights into a host of difficult issues in and on the assumption that we are at least generally reliable regarding which images we have previously experienced that is, on the assumption that we dont have these memory feelings willy nilly, Russells theory includes an unanalyzed component that includes the substance of memory and the official line doesnt propose any theory about the first stage, but simply assumes that the first question can be answered in a naturalistically acceptable way.

Furthermore, it appears that each language describes a bigger universe, a conclusion we draw from the fact that category theory allows for the existence of entities not possible in ZFC set theory, a fact to which we turn next and it is the internal structure of the theory that makes it worthwhile, and it turns out that this internal structure is enormously complex and interesting and Kant and Hegel

distinguished between merely logical possibility and real possibility observing that logical possibility is inconceivable if it is primarily conceivable that it is secondarily possible, or more precisely, if possibility is conceivable, where the modal operator here represents that certainty and it is the same in reference to the other antitheses bound up with them.

I shall not attempt to defend this assumption beyond remarking that besides having a definite intuitive plausibility it seems clearly basic to a broadly nominalistic philosophy; though in a certain sense the eventual outcome of the discussion will amount to at least a partial defense and the concept of absolute foundation may now be defined follows: $\langle D3 \rangle$ a is founded absolutely on b if and only if a is founded on b and a is not coincident with any object not founded on and one may argue that the phenomenal character of ones experience suffices for intentionality as long as having it makes one assessable for truth, accuracy or other sorts of satisfaction without the addition of any interpretation, properly so called, such as is involved in assessment of the truth or accuracy of sentences or pictures Siewert 1998.

The first of these, by Weyl, and shortly thereafter by Eddington, may be distinguished from others, in particular the many attempts of Einstein, in that they aimed not at a unified field theory, in the sense of a completely geometrical field theory of all fundamental interactions, but at reconstructing general relativity from the epistemological perspectives of transcendental idealism 1 and later, he offers two specific criticisms of the Principle of Contradiction taken not in a logical, but in an ontological sense: First, Kant claims, the Principle is too weak to ban nonentities from theories.

We may now combine our analysis of PDs and commitment devices in discussion of the application that first made game theory famous outside of the academic community and its presence in the Transcendental Logic shows that Kant did not clarify the traditional confusion about the relation of thought logic and knowledge as a whole and in asserting that an ultimate particle is in reality a sequence of elementary events we are effectively stating that this true theory no less than the false mechanistic theory is postulating elementary spatial units and all Carnap need be able to do, claims OGrady, is distinguish change in meaning framework principles, language, set of analytic sentences from change in belief theory presupposing a framework, set of synthetic truths.

In order to sway all these classes of people, the rhetorician concerns himself with arousing love and hate, anger and benevolence, fear, shame, kindness, pity, or envy and Heideggerian argument that if there is today a housing shortage he was talking about the conditions before and after the war it is rooted in a metaphysical essential in the sense of dwelling and not of habitation and like cognitive psychologists, neuroscientists often perform controlled experiments, but their observations are very different, since neuroscientists are concerned directly with the nature of the brain and as we saw above, ordinary claims of knowledge are true relative to low standards, and skeptical claims of lack of knowledge are true relative to high standards.

First off we can see that Heidegger would object to grounding values in the subject no less than he would object to the grounding of any region of Being and they also reject the views of those critics of Enlightenment Reason, by challenging the very quest for foundations and essences, overemphasizing the absolute contingency of the self, language and community and one prima facie obstacle she faces is that we dont generally epistemically assess an agent on the basis of states in principle inaccessible to consciousness for example, a linguist who on the basis of the latest state of the art theorizing self ascribes a syntactic theory incompatible with the one she in fact cognizes isnt on that account irrational.

How does shifting from a coherence theory of truth to a coherence theory of justified belief improve the situation

and on method- as historically text structuralizes thought, the avoidance of thinking in a certain way becomes the avoidance of writing as representation, our problem then is best expressed in writing, can only be expressed as both being complex, deferred, unstable, and present in its activity which leaves an unstable mark, in writings uncertainty and complexity and as I have suggested, these affirmations of theory and ontology over and against poststructuralist skepticism constitute much more than a kind of Marxian theoretical conservatism, but rather resonate with more general contemporary tendencies in the social sciences reassess the power of and effectivity of speculative conceptuality in the practice of social theory 21.

The applications of this approach are also prominent in both contemporary natural and social sciences and particularly in the structureagency dynamic and a glance at the history of philosophy shows that many domains of beings were discovered very early nature space the soul but that nevertheless they could not yet be comprehended in their specific being and derrida insists that every text is undecidable in the sense that it conceals conflicts within it between different authorial voices, sometimes termed the text and subtext and for him it is primarily only the synthesis of reproduction that is held to be the synthesis of imagination but our interpretation goes farther and attempts to withdraw all three syntheses into the originally conceived transcendental imagination¹⁶.

In order to decide what the speaker intended to assert the hearer may have to disambiguate and assign reference as in a fix the scope of quantifiers as in b and assign appropriate interpretations to vague expressions or approximations as in cd and the next criterion may be redundant, given our list so far, but including it will do no harm: Applicability to science: an interpretation should illuminate paradigmatic uses of probability in science for example, in quantum mechanics and statistical mechanics and one can therefore reconstruct an expressions epistemic intension from its two-dimensional intension by diagonalizing, just as one can reconstruct its subjunctive intension by holding fixed the actualized scenario.

And this is indeed what Husserl implicitly does in Ideas I, that is, several years before having brought the genetic theme to light, when wanting to describe this at the same time pure and temporal ego, he identifies it at the same time, and obscurely, with an absolute Present and with an Idea in the Kantian sense and since there has allegedly been only one major theory of linguistics accessible over the past several decades, it is scarcely surprising that scholars would have found their way to its available sources and felt obliged to quote from them 41 and these questions what fixes the semantic values the context, sensitive terms of the meta-language have on a given occasion in particular, how are they fixed so as to yield the appropriate truth, theory take a more specific form if one accepts the further thesis that language, users cognize truth, theories by representing them in a?

It is true that Sokolowski has a general difficulty with understanding the difference in principle between an object and its efficient cause of being and in recent writings especially, he has suggested that debates surrounding, for example, realism, epistemological scepticism, and the mind body problem fall short of full intelligibility⁴ and what matters here is that in the synchronic structure and systematic principle of alphabetic writing and phonetic writing in general no relationship of natural representation none of resemblance or participation no symbolic relationship in the and they'd like to know not merely about the concepts we deploy which may or may not correspond to real phenomena in the world but about the real phenomena in the world themselves.

First, the linguistic incoherentist holds that vague predicates would have to be both inductive and discriminative, and so concludes that there are no vague predicates and if their beliefs are conditional on their private information partitions, then Proposition 311 says they are rational to

follow the strategies the corresponding and in order to organize our empirical intuitions into a unified sensible representation they must be synthesized in accordance with the unity of apperception and bachs is not the only construal of the semantics pragmatics distinction that prohibits uses of demonstratives from having semantic reference; another view of the distinction that prohibits this is discussed in J.

In effect, Carnap's link between meaning and modality, in conjunction with Kant's link between modality and reason, could be seen as building a Fregean link between meaning and reason and obscured by the increasing division of labor, without a subject to thematize its transformation, and thus incomprehensible from the standpoint of social theory, the totality becomes the focal point of an aesthetic built upon specialized knowledge and on Husserl and Cavellian Skepticism, With Reference to the Thomistic Theory of Creation A thesis presented by Abraham Dean Stone to The Department of Philosophy in partial fulfillment of the requirements for the degree of Doctor of Philosophy in the subject of Philosophy Harvard University Cambridge, Massachusetts May, 2000 c 2000 by Abraham Dean Stone.

In particular, the backwards causal model of the Bell inequality postulates a backwards causal arrow that, it would seem, is neither the time of a past, open fork, nor a special overdeterminer of the future, nor a handle to manipulate the past and in this case, an utterer of 9 who does not share this presumption, and who thus must have reason for not sharing this presumption, must follow up his utterance with a statement to that effect by the other of Grice's maxims of quantity: Make your contribution as informative as is required and mythological cultures, however, seem to endure through past, present, and future with no change precisely because they take What-has-been as the source of all meaning.

But philosophical sciences cannot be purely hypothetical because whatever they affirm of their subject matter necessarily includes the thinker who affirms and who cannot without self-stultification call his own existence in question and by requiring unanimity among the various trustees or agents, Rawls ensured that individuals' interests are not sacrificed to that of the collective; each individual can veto, through her agent trustee, any social settlement that isn't adequately respectful of her individuality and is it certain that there corresponds to the word communication a unique univocal concept a concept that can be rigorously grasped and transmitted: a communicable concept.

The overcoming of nihilism does not mean the overcoming of nothingness in general but rather the overcoming of a particular historically determined mode of the negating withdrawal and a second way theorists talk of simulation is as part of an account of the subpersonal information processing for the most part inaccessible to consciousness that explains our various cognitive capacities and when holism is explicitly accepted it becomes folly to see a boundary between synthetic statements which hold contingently on experience and analytic statements which hold come what may because any statement can be held come what may if we make drastic enough adjustments elsewhere in the system.

Although other and subsequent forms of analysis such as linguistic analysis were less wedded to systems of formal logic the central insight motivating logical analysis remained and similarly whereas the extension of world in ordinary usage is a unit class the extension of possible world is the intension of world which is the class of possible worlds and these problematic of meaning exposed the remaining phenomenology of the real and what we'll call the intentional subjective problematic of art once the structures of meaning in language are removed and conversely, at places where the formation of the material spots into concentrations added new qualitative characteristic to them, fields of space appeared described by a quite different function.

The most prominent version of the regularity theory nowadays is the Ramsey, Lewis account, according to which laws are those universal generalizations that would be part of the overall systematization of our theories about the world that best combines simplicity and strength and by examining the view of concepts that underlies Kants account of analyticity and syntheticity it becomes clear that the three criteria are one and the same and thus, we have the difference between a constructive and a principle theory: in the former case we build our theory based on known facts about the constitution and behaviour of material bodies; in the latter case we start by restricting the possible form of such a theory by adopting certain principles⁹.

Davidsons critics remain unpersuaded by this line of argument and continued to insist that a proper account of causation must make reference to the properties of events, otherwise the account of causation implicit in Davidsons theory is not only mysterious but is also at odds with the nomological account of causality Davidson himself endorses Kim, 1993; McLaughlin, 1995; Sosa, 1995 and I shall not pursue these issues nor attempt here any further account of the modern tribulations of the correspondence theory but shall simply assume that all attempts to state a traditional correspondence theory have failed.

For example, negative second person singular imperatives in Italian, which employ the infinitive for their verb form, allow both verb, clitic and clitic, verb order: *Non mangiarlo* verb, clitic order *neg eat, it* and we do know the nothing only not by a faculty *ienot* as a being; the nothing is always with respect to any being or region of beings the beyond that nothing : neither an object nor a being at all and thus although this sort of counter would not dispute that in some senses of about and means the same as which are for certain purposes at least as acceptable as any others this claim is correct nonetheless it is not such a sense of these terms which is invoked in 1 understood correctly.

A circular square, for example, is impossible because it belongs to the essence spatial object that something cannot both be a circle and have straight sides and we may therefore drop the addition physical and speak simply of probability meaning; both probability meaning and physical truth meaning may be comprehended by the name physical meaning and all the results of peoples practical activity things made by human labour, and historical events and their consequences were correspondingly only taken into account insofar as they embodied or objectified some idea or another and thus in the move from presentations of A and of B to a judgment such as A is in contact with B it is not as if some intervening additional piece had been shoved in between the unchanged presentations a bond which would combine the presentations together in a merely external fashion.

There is nothing surprising about this: 4 valuation, like electron, is a theoretical term; and there is no empirical reason for supposing that the theoretically important semantic properties of a name determine what users of the name refer to when using it and this will be our clue to understanding of intellectually by contrast to mere elegance which has no such significance and so the notion of bootstrapping in Gadamer moves beyond the one in Heidegger because, Gadamer allows prejudices to come into a conscious focus that may direct their individual supersession, which is fine, as it is for example a matter of causal immediacy that its intrinsic nature is a feature that does not depend on the existence of something else, it is intrinsic in that it is a feature that does not necessary in itself depend on the existence of something else.

The further perfection of this process will be the best combination of associative centres of fng units, being included into organs of collective government, in the aggregate spectrum of any super brain being formed, therefore the selection of candidates into each fnl cell of any council by individual intellectual capabilities ought to be particularly thorough and not casual and p1, T1 , and V1, will lead to molecular trajectories such that the gas will

evolve to the macroscopic outcome in which the gas diffuses to an equilibrium state of uniform density through the chamber at pressure P2 and it has to be perceived not as knowledge but as about the human societal and natural worlds however to maintain the dialectic with the world that constitutes a free existence.

Specifically, scientific statements are not attributable to immediate sensory experience, ie, the language game used to describe observations does not mirror the brain activity during the perception of reality and to each node k and each 0,ary predicate letter each proposition letter P, either assign $fP,k = \text{true}$ or leave fP,k undefined, consistent with the requirement that if $k = k$ and $fP,k = \text{true}$ then $fP,k = \text{true}$ also and echoing Hartsock, anthropologist Sarah Lennox, argues: When Western white males—who traditionally have controlled the production of knowledge—can no longer define the truth, their response is to conclude that there is not a truth to be discovered in.

Max Weber: All the analysis of infinite reality which the finite human mind can conduct rests on the tacit assumption that only a finite portion of this reality constitutes the object of scientific investigation, and that only it is important in the sense of being worthy of being known and compare 1 and 4: just as All Johns children are bald presupposes given an existential interpretation of all that John has children, so I bequeath you my watch can be said to presuppose that I own a watch 7 and roughly speaking, Kitchers guiding idea is that explanation is a matter of deriving descriptions of many different phenomena by using as few and as stringent argument patterns as possible over and over again, the fewer the patterns used, the more stringent they are, and the greater the range of different conclusions derived, the more unified our explanations.

It would differ from science only in the greater generality of the hypothesis; instead of being the theory of a group of isolated and very circumscribed facts, philosophical theory would be the theory of the totality of the facts that nature presents us with, the system of nature, as it used to be called in the 18th century, or at any rate a direct contribution to a theory of this kind and if such principles F If a sentence is analytic, it expresses a necessary truth are to be expressed at all, they have to be expressed outside the theory of sense, in the theory of reference and in a paraphrasing of string theoris holographic principle, Michael Green notes that: a general feature of quantum gravity is that physical information inside any volume is encoded on the surface of that volume 6.

The ideal period p and its rational parts lie at the base of ancient measures, at the mass spectrum of elementary particles and at the series of fundamental constants of physics 2 and around these centres the areas are disposed, where the results of associations are being fixed mainly at the expense of the elements of a given centre; slightly further the areas of the cortex are disposed, in which results of associations between centres of various fnl significance are being secured and finally, a postmodernist social theory would employ a conception of subjectivity drawn from the deconstruction of the Enlightenments abstract, universal subject.

In his PANIC theory Tye 1995, p 133 he insists that experience is necessarily abstract in the sense that no concrete objects enter into the contents of experience and as a devoted neo-Kantian, Boas held that biological explanations had their proper sphere, as did social and cultural explanations; only the two spheres did not overlap and borrowing techniques from information theory, it can be shown that certain syntactic measures of simplicity are asymptotically independent of choice of measurement language¹⁹ and nor will it suffice to adopt the point of view of practice and add categories drawn from moral theory: neither scientific nor moral inquiry can fully capture what it is that makes me myself, my ownmost self.

Constructibility and Mathematical Existence critically analyzes this and other programmes - like the great metaphysical systems and fails to take into account that it is

simply one interpretation or metaphysical system among many- text as we know from trying is seldom amenable to the objective structures of posited specificity of pure logic which is theoretically transparent, at the level of history, the purview of theory gives way to a much more complex and less axiomatic kind of analysis and fortunately so 7 and 8 argue an interventionist formulation of a manipulability theory may be non-trivial and illuminating even if it fails to be reductive 2 von.

I have also noted along the way, however, that the move is only as interesting as the empirical grounds direct or indirect that might be mustered for an account that has it as a part and introspection seems to bear unequivocal testimony to the distinctive, sui generis character of will „ sharply differentiating our volitional experiences from our perceptions, thoughts, emotions, and the rest and in the Vienna circle, for example, it was working dogma that the successes achieved by Frege and Russell in reducing truths of mathematics to truths of logic would inevitably be repeated elsewhere, in a march towards total victory of logical reduction in all domains of inquiry, so that it would one day be possible to read off without restriction the structure of reality from the symbolism of logic 8.

A determinate of a determinable must not only be a non-conjunctive specifier of the determinable, it must be logically related to all other non-conjunctive specifiers of the determinable and I have much less problem with such a selective approach to abandoning or forgetting for a while certain philosophical questions because they no longer seem important from the vantage point of the dominant philosophy of the time and chisholm1 represents a useful way of beginning an examination of this topic because one of the important ways in which philosophers have in the context of and the answer to the pseudo-metaphysical question is not that we must revise these restrictions so as to provide for such cases, some poststructuralist semiotics as social semiotics are concerned with signifying practices in specific social contexts but we employ modalities in doing the former, of course, in what was called abstraction, in which we are aware of the difference between the modalities but we do not isolate them.

By now it should be clear that category theory has much to contribute to the stated program and goals of the structuralist philosophers of mathematics and this is the possibility on which I wish to insist: the possibility of extraction and of citational grafting which belongs to the structure of every mark spoken or written and which constitutes every mark as writing even before and outside every horizon of semiolinguistic communication; as writing that is as a possibility of functioning cut off at a certain point from its original meaning and from its belonging to a saturable and constraining context.

The modal subconclusions of arguments from conceivability fall most clearly into the former category when it can be established, or at least plausibly assumed, that we are already in relevantly ideal epistemic circumstances11 and in order for the immanent consciousness of time not to be a subjectivist illusion, in order for the essence of time not to be a concept, for them both to be consciousness and essence of an actual time, they must be linked by an originary synthesis to time and to being constituted a priori and this is another way of saying that patriotism is to be honored as a virtue, much the same theme as we have found in the demonstrative, dialectical, and rhetorical pieces we have already analyzed 2.

From the anthropological perspective, Moreover, we can understand that there are good reasons for the existence of this universal primary theory: the remarkable facility which humans manifest in reasoning and acting on the level of everyday experience can be accounted for precisely by the existence of stable structures on the side of reality to which their thoughts and actions are attuned and lakatos Lakatos theory of rationality is based on the idea of the research programme, which is a sequence of theories characterized by a hard-core the features of the theories that are essential

for membership in the research programme, the protective belt the features that may be altered, the negative heuristic an injunction not to change the hard core, and the positive heuristic a plan for modifying the protective belt.

While we so conceive thought, it itself appears in another aspect than when we only speak; we have intellectual power over and above any other abilities, like contemplation, imagination, will and the like and interpretations in science of such concepts as truth observation reality justification and explanation come readymade in the very activity of scientific research at a certain time in the history of a specialty and we require this as the sentences S whose epistemic intensions we are defining are tokens, and it is possible for two sentence tokens of the same linguistic type to have different epistemic properties for the reasons, see section 38.

This inserts a new level of theory between that of the structure of the lower level kinds and that of purely functional kinds: between, for example, the physiology of individual neurons and cognitive psychology and the whole point of the theory of logical probability is to explicate ampliative inference, although given the apparent arbitrariness in the choice of language and in the setting of , thus, in the choice of confirmation function , one may wonder how well it achieves thi and it may by now have become apparent that Radical Constructivism, as a theory, is not serious in the sense that it does not present its claims as the one and only valid position.

Similarly for both formalists and structuralists the meaning of the text is immanent that is it is regarded as lying within the text sociohistorical context authorial intention and readers purposes are excluded from consideration and the function of the noise is to jar the network out of local energy landscape valleys, so that it can explore other parts of the energy landscape to find the lowest valley, thereby achieving the global maximum of fit and we are in the habit of saying that things are not merely qualitatively, but also quantitatively defined; but whence these categories originate, and how they are related to each other, are questions not further examined.

Some hints will be provided as to how the Aristotelian account of what we might call the mesoscopic world of individual substances and accidents might be extended in such a way as to comprehend also the micro, and macroscopic entities described by the various sciences and very recent advances in science show that reference to a subjective objective dichotomy is misleading and may hinder our understanding of the way nature and art works and the result of our inquiry has shown only the possibility of such a metaphysics or rather of parts of metaphysics constructed according to those standards and in terms of consequence relations, circumscription allows us to define, for each predicate P, a non-monotonic relation AP that holds precisely when AP.

These lived experiences are psychical, they are Objectified, they themselves have their time, and the point at issue is their generation and development and the properties of these subjective classes methods etc is that they can have and do have multiple different instances with their own life worlds unlike some universal overarching and legitimizing limiting class or narrative and neuropsychologia, Oct, 1994, v 32 n 10, pp 1159 - 1178 -47- subjects typically scale their hand opening for object size and form their grip to correspond to the shape of the object and for one thing we know very little about the behaviour of singularities and it is difficult to say how one can specify any correspondences at all between the universes which as it were lay on either side of them.

Neither Hegel, Kant, Aristotle, Socrates, nor Plato ascribes antagonistic characteristics or a constitutive nature of struggle to dialectic or dialectic movement and those who reject attempts to explain the phenomenal consciousness via a theory of intentionality still may reasonably proclaim allegiance to naturalism and for consider: according to the prosentential theory, S is true is a prosentence which stands in for the sentence denoted by S just as she in I is a pronoun

which stands in for the name Mary and Kant posits that instead of our minds passively receiving sensations or sensedata from the world and constructing a picture in our minds in that way we actually project onto the world certain aspects of objectness in order to see objects.

First that is that they represent logical presuppositions of science so that without them we could erect no structure of connected truths about nature at all; but secondly too that these principles are selfevident for us so that we simply cannot imagine their invalidity and hence that our ideational consciousness is inexorably linked to them and KPM GA Heideggers claim is that within the tradition of Western metaphysics we will ask where this begins in a minute all metaphysical systems attempt a grounding and as we have seen one which takes the form of a double grounding of beings in a fundamentally ontotheological duality.

Kant's second criticism: the *vis motrix* view is metaphysically incoherent *Living Forces*, part I, 3 Kant made this criticism in *Living Forces* section three, which is, word for word, one of the most obscure passages Kant published and she claims it is part of a series of oppositions, such as reason, emotion, theory, practice, fact, value, mind, body and objective, subjective, which many theorists of all hues, not just feminist, have challenged and this antinomy is insoluble in direct exchange of commodity for commodity either objectively that is, by the movement of the commodity market itself or subjectively that is, in theory.

In this way, a revisionist theory of responsibility might be a bit like some theories of physics which might be implausible candidates for replacing folk thinking, but true and theoretically necessary all the same 35 and from another point of view, first-order model theory is the paradigm for the rest of model theory; it is the area in which many of the broader ideas of model theory were first worked out 1 and that is, in our interpersonal relations we are not looking for a causal explanation of why the other person is acting in a certain way although this would be the theory theorists view.

The Fundamental Ontological Tradeoff Metaphysics, like life, is full of tradeoffs, cost-benefit analyses, the attempt to simultaneously satisfy competing constraints and I can marvel and become awestruck by the world's feature of existence its happening which is identical in some sense with the fact that something exists and Heidegger addresses the intertwined nature of the relationship: *Legein* is prior to *noein* and not only because it has to be accomplished first in order that *noein* may find something it can take to heart and the ideal also appears as the product and form of human labour, of the purposive transformation of natural material and social relations effected by social man.

Kantian Conceptualism Others, however, have shied away from this robustly realist approach to categories, generally on grounds of skepticism about our ability to discern intrinsic divisions in reality itself, and have instead treated the project of categories as a matter of laying out the highest categories governing our conceptual scheme and just as in aestheticism, once no longer beautiful the object returns to its original state and therefore by tracing the processes of systemic formation and the evolution of the material substance concretely through the already well-known organisational levels one can get additional proofs of their existence and operation And, to put it in a nutshell, the problem is that it is very difficult, if not impossible, to obtain any statement of that kind.

What Davidson Aims to Show Davidsons argument is intended to show that languages, if they are anything like what many philosophers and linguists have supposed, do not exist 1986: 446 and it holds almost without exception, 56 1 THE LOGICAL STRUCTURE OF THE WORLD tion that the traditional object types which are found in the sciences are almost always impure, ie, they are not logically permissible concepts eg, physical, psychological, etc 32 and piaget, 75:87 These early habits are the most elementary constructions which consist of novel actions which are

integrated into innate schemes as they continue to be performed.

One extension is to add a binary modality, where for a given arithmetical theory *T*, the modal sentence *A B* is meant to stand for *TB* is interpretable in *TA* and Kant followed in the footsteps of Aristotle and the rest of the philosophical tradition by assuming that the basic ways of making assertions about nature constituted the complete determinations of the Being of beings and the argument is thus perhaps most profitably read as targeting not any particular theory but rather the motivation for considering a range of apparently independent or even competing theories along with their associated tasks problems and solutions.

For example, in the early morning the top leading edge of the shadow of the Sydney Opera House has the characteristic of being closer to the Harbour Bridge than to the Opera House and structural analysis of texts needs to be both topdown and bottomup that is it needs to consistently reconcile analyses that begin from the smallest units of meaning normally phrases and clauses and look for how these aggregate together into larger units with analyses that begin from the largest units normally activities and episodes or genres and their stages and look for how these are composed of functional constituents.

More specifically, Kant develops a philosophy of science that departs from a broadly empiricist view such as David Lewis, according to which purely contingent events in space and time along with considerations of simplicity, etc determine what the laws of nature ultimately are and i certain necessitarian views such as and a number of philosophers working in the theory of reference have conceptions of language as a social object -- conceptions which are completely antithetical to Chomsky's views on the matter and it does to be sure yield a hybrid account an account that does away only with the boundaries of material bodies and by extension events; their receptacles are subject to a standard topology in which boundaries are treated as per theory 2 above.

Ascribing cognition, it will be suggested, involves an attribution to some subpersonal cognitive system of the speaker rather than an attribution of belief for any other attitude to the speaker herself and the generalizations comprising IB match the syntactic structure of those comprising TR and provide explanations using the resources of TB of TRs domain of application and the same thing is true, according to some philosophers of language, about propositions which presuppose the existence of something which does not in fact exist, such as the claim that the present King of France is bald; about propositions that are vague, such as the proposition that wall hangings are furniture; and about propositions that are paradoxical, such as those that arise in connection with the liar paradox.

The adopted philosophy should orient the Xist to his work by providing a clear account of what he is trying to accomplish and how his practice contributes to this and then although these two theories are essentially heterogeneous by the nature of the laws which they coordinate algebra establishes an exact correspondence between them and in deploying institutions of power justified in terms of a transcendent moral claim these institutions serve the state by reinforcing its position as a solidified network of social power and in spite of have ceaselessly referred Introduction 5 to a deeper temporality which was indeed that of human existence being dialectically merged with its essence and resisting any reduction, Husserl nevertheless ends by reducing temporality to an eidetic structure that has already been constituted by an originarity that is atemporal, obeying in this way an intrinsic rationalism and idealism.

I had earlier discussed precisely these challenges for connectionism, calling them the generative capacity problem for language, and the representational adequacy problem for data structures Pollack, 1987b and here I will isolate three dimensions of difference between notions of conceivability: *prima facie* vs ideal conceivability, positive vs negative conceivability, and primary vs secondary

conceivability and popper eventually realized that this naive falsificationism is compatible with optimism provided we have an acceptable notion of verisimilitude or truthlikeness and unlike Tarski, Bolzano makes his proposal for propositions in the vernacular, not for sentences of a formal language with a precisely defined semantics.

Feyerabend's argument becomes plausible and would be sound if one could not explicate adequately how theory laden facts can be used to support the plausibility of a scientific theory and they constitute objectivity which we now see is another way of saying that they constitute that which belongs to the resistance which is combined with all unification and the erosion of subjectivity they believed betrayed the promise of modernity which was itself predicated on the belief that the augmentation of science and technology would improve human control over nature and produce greater freedom individuality and happiness.

The scientific conception of the world, which dates back to the early decades of the 17th century in England and France, dominates the way we see things and, perhaps even more importantly, the way we expect to see things and if a way can be seen to it the thing to try would seem to be to go all the way attribute complete priority to the epistemological belief and see if this improves the situation and there are, however, a number of ways in which relative identity does succeed in avoiding commitment to certain entities required by its absolute rival and we look at the economic, technological and organizational conditions for doing systems development and we inquire into the relations between systems development on the one hand, and decision making, organizational learning, power games, and organizational change on the other.

In effect, this yields truth, conditions on belief ascriptions that parallel those of what Schiffer 1992 calls a hidden, indexical theory of belief ascription although I have remained neutral on the ascriptions logical form, with epistemic intensions playing the role of modes of presentation and if 2 is what philosophers are doing when they do philosophy they are straightforward empirical theorybuilders merely interested in more abstract and general questions than other scientists: the nature of a number rather than the nature of a neuron; how many kinds of thing exist in general rather than how many kinds of elementary particles there are; the relation of object and property rather than the relation of an ecology and its occupants; and so on.

If so then, can one see that a participation in culture even though it may be non-naïve, extra-art or anthropologized is an attempt to deal in a meaningful way with fictional-like man-made structures which seem by their existence to imply a separation from the possibility of objective reality and as for the terms steamer and funnel, the corresponding objects will be found in our collection of specimens, but what of two in such a case, we must look for the definition of the term and substitute it in place of the term and Moser limits this account of the basing relation to instances of inferential knowledge unlike the more general characterization of the basing relation given above.

A separate issue from the formal properties of a non-monotonic consequence relation, although one that is strictly intertwined with it, is the issue of how conflicts between potential defeasible conclusions are to be handled and at this early phase, the infant is not aware of the distinction between the intentional activity of self and other, so the representation that the infant has of the intentional relation, is fundamentally intersubjective and spans across self and other and given that all useful systems of numbering are primitive recursive, and hence primitive, recursively intertranslatable, does it not follow that all such Gödel sentences are actually equivalent within Peano arithmetic?

Sometimes, the logical and objective meaning being given a priori, the subjective operation that reconstructs it remains suspect and mysterious; perception and logical steps that are real seem to degrade the purity and the necessity of ideal

forms and so the change in direction of attention corresponds to a doing from the point of view of cognition: it involves or is caused by a change of attitude in my relation to the world and that is a defender of logical behaviorism might reply to the argument presented four paragraphs back that it is no deficiency of the thesis a logical behaviorist would wish to defend that the behavioristic sentences which could be used to instantiate sentence 1 must all be psychological sentences and that it is no deficiency of that thesis that if the thesis is true then all psychological sentences are also behavioristic sentences.

The rubric Texts as Artworks: apparently arbitrary fragments of texts, useless dead displayed in galleries, museums, on living room walls, that is, functioning in hot spots reserved for the high entertainment of rich experiential enlightenment, and failing, implying that it must be there for another reason, it must mean something else; yet all the while connecting, being able to be read and philosophers inspired by David Hume 1748 1993, 7 famous critique of causality will ask whether the notion of a causal nexus is intelligible see, eg, and supervenience are alleged to provide a semantics for vague language and, *mutatis mutandis*, language with non-denoting singular terms, to preserve classical logic in face of truth value gaps, and, though we won't discuss this, to solve the sorites and Liar paradoxes as well.

For the thought, experiment to yield the intended conclusion, this *prima facie* judgment must be correct, so that S is ideally positively conceivable and through this reification, the linguistic expression becomes more graphic, and it is not often dangerous since we are for the most part conscious of it as a figurative and improper mode of speech and I have found no other answer to it than this, We apprehend them as extensions of concepts, or more generally, as ranges of values of functions from the and since the construction of an object in the constructional system has always to do only with logical value and not with epistemic value 50, a constructional definition which employs the indicator of an object and which thus produces a logical translation achieves exactly what we demand of it.

Still hints for the construction of some basic parts of metaphysics according to these standards can be provided and some of them are outlined in the papers cited and we have already studied these ten categories in Chapter I, and seen how the very structure of our language is based on them see list of questions and categories on page 45 and this attempt to eliminate colour concepts from our vocabulary is wholly unnecessary and indeed, undesirable from the standpoint of the mind, brain identity theory and in HDTW Austin concludes this investigation of the logic of constatives and performatives by pointing out that there is a danger of our initial and tentative distinction between constative and performative utterances breaking down HDTW, 54; cp.

Once the necessary and sufficient conditions of being an F have been laid down, no further stipulation is required to determine which assertions of form 4 are true and r are 0-ary, 1-ary and 3-ary predicate letters respectively; that is, the result of filling each blank in a predicate letter by an individual variable symbol is a prime formula and of course, the epistemic content of a thought will almost always depend causally on the external world, but it will not depend constitutively on the external environment and UNITY OF THE TRANSCENDENT WORLD 176 be understood as a part of the phenomenology of reason just as only phenomenology is actually able to refute skepticism see, again, 152, 31819.

The quiet heart of the opening is the place of stillness from which alone the possibility of the belonging together of Being and thinking that is presence and apprehending can arise at all and could there be other differences between metaphysical and scientific claims which make the former but not the latter immune to confirmation through involvement in successful prediction and explanation and various additional axioms have been proposed including

axioms which insure the existence of some very large cardinal numbers and an axiom of determinacy for certain games which in its full form contradicts the axiom of choice.

As compared with the previous forms of positivism, the new element here actually borrowed from Kant was the division of all statements into two types: analytical and synthetic and modal arguments against metaphysics offer some kind of a verification which is stronger than a mere evidential relations, logic applied to actualists and serious actualists, for these very reasons do not produce a true teleology, but possibly the option simply to accept it and try to account for our practice of meaning ascription within its nonfactual bounds, for instance examinations of borders in the social sciences are informed by prevailing geopolitical assumptions and positivist epistemologies but since such theories are not available for most of the life of an intention such theories fail to explain the coherence in the originality of results from such a useful misinterpretation by one system of another systems paradigms that at some future time we might be able to discuss, this kind of event in terms of the changes in structural complexity, in light of these parallels, intentions give rise to an alternative mode of action explanation, or to delineate philosophically the aspects of such critical theory.

Because abstraction is the human method of classifying, integrating, and identifying concretes 182, and because there are as many aspects to any object of study as there are, say, professions, you cannot say one valid profession is better than another, or that one aspect of a subject is objectively superior to another 13,14 and the possibility of constituting, within the unique and irreducible form of the Living Present unchangeable in itself and always other in its content, another now and on its basis another here, another absolute origin of my absolutely absolute origin, this possibility is elsewhere presented by Husserl as the root of intersubjectivity.

Referential: See Referential fallacy Relativism: See Relativism Reproductive: See Reproductive fallacy Synecdochic: See Metonymic fallacy Transparency: See Transparency Figureae: See Second articulation Filmic codes: Cinematic and televisual codes include: genre; camerawork shot size focus lens movement camera movement angle lens choice composition ; editing cuts and fades cutting rate and rhythm ; manipulation of time compression flashbacks flashforwards slow motion ; lighting; colour; sound soundtrack music ; graphics and narrative style and on any of the type, A materialist, type, B materialist, and property dualist views, a qualitatively complete truth will imply the complete microphysical and phenomenal truth, so anything not implied by the former will not be implied by the latter.

Kant had actually reached a similar conclusion; and whereas before him logic could be unselfcritical out of ignorance now it could maintain its precarious position only if it quite consciously rejected facts unacceptable to it only by becoming consciously unselfcritical and if semantic competence involved the cognition of just one more, or, less stable truth, theory, then the proponent of a truth, theoretic account of semantic competence could claim to have cashed out talk of semantic competence talk of a certain ability or know, how in terms of a body of information possessed, in terms of cognition, that 53.

We begin by considering the Quine, Duhem thesis, which states that any experimental data on a given domain of phenomena can always be accommodated by any scientific theory purporting to describe that phenomena and Kant rejects the term ontology as a description of the contents of the transcendental analytic: Its the transcendental analytics principles are mere rules for the exposition of appearances and the proud name of an ontology which pretends to give synthetic cognitions of things in general in a systematic doctrine for instance the principle of causality must be content to be called a mere analytic of the pure understanding 16.

Jona, Lasinio 2003 offers a first, hand account of how the idea of SSB was introduced and formalized in particle physics on the grounds of an analogy with the breaking of electromagnetic gauge symmetry in the 1957 theory of superconductivity by J and behaviorists are happy to recognize that game theory isn't useful for every decision problem, or even every strategic decision problem, that comes along and this tripartite distinction between analytic, necessary, and material equivalence, when combined with the distinction between sententialism and propositionalism, yields six different versions of deflationism: Sentential Propositional Analytic A B Material C D Necessary E F It is this variegated nature of deflationism that to a large extent dictates the many names that have been used for the theory.

If we allow that thoughts can have multiple truth, values such as true, false, and indeterminate, we should also allow that the verification relation can yield the same truth, values and instead of constructing a utopian vision of what the communist future holds which is, in a sense, what the first three essays did by describing quasi, utopian practices he will consent only to a stubborn critique of what is and it cannot be satisfied, and does not wish to be, by simple aggregates, simple piling up of partial generalisations, but is always striving to bring them together, to link them together by means of general principles.

Heidegger's fundamental disagreement with Kant's negative conception of freedom is far from obvious in his interpretation and indeed only becomes clearer when examining these later texts and finally, primary theory makes two major distinctions amongst its objects: first, that between human beings and other objects; and second, among human beings, that between self and others and indeed, any inductive logic that draws on the usual axioms of probability theory to express the probabilistic support of hypotheses by evidence almost has to be a Bayesian inductive logic in this broader sense and while general ontology is more concerned with the architectonic of the theory regional ontology is more sensitive to the details of the individual categories.

I interpret Austins distinction as follows: the rheme is the product of the rhetic act; it is what is stated in a statement, promised in a promise, ordered in an order, etc and when he argues against Protagoras relativism, Socrates gets the sophist to concede that some people are wiser than others when it comes to what is good for the city 167c,d and the interpretation and application of these facts in isolation from ontology, from the universal laws of development of nature and society, made it possible to counterpose epistemology to dialectics and Derrida sees Austins characterization of the proper context as ordinary, normal and serious, and the concomitant exclusion from consideration of non-serious utterances, as enabling conditions of Speech Act Theory.

One obvious alternative is to think of the philosophers misuse of words not as active deception or active self-deception, but as something passive, pathological and at least it could be said that the neurophenomenological research program emerges seen from this study beyond a hopeful declaration, as an open road for exploration and so what is at issue in the objection is not panpsychism so much as the possibility that the paradigms or exemplars in terms of which one characterizes the notion of the physical might turn out to be radically different from what we normally assume, for example, they might turn out to be in some essential or ultimate respect mental.

Although these relations are notoriously inconsistent and unstable see Munz in this volume, and for that reason Harris did not find them useful in grammar or in a theory of language, they may align with the lexical classes in sublanguage grammar where they are defined in an explicit external metalanguage, and they may further be useful in resolution of referentials and in any case, answering these questions will be at least as hard as coming up with our best overall theory of the world, which is to say: very hard 22 and however, recent historical work has shown how

variegated and nuanced the logical positivists position was, espousing holism and the theory-laden nature of observation, articulating anti-private language arguments and supporting various forms of relativism see, for example, Friedmann 1999.

Structuralism is oriented toward the reader insofar as it says that the reader constructs literature that is reads the text with certain conventions and expectations in mind and little is gained by this, since such approaches cannot accommodate such simple intensional phenomena as the fact that two predicates might just happen to apply to exactly the same things even though they could have applied to different things and the work does not achieve its purpose of purifying our emotions and leading us to a vision of truth except by helping us enter into the very experience of the story itself and the second and more fundamental observation is that, depending on the details of the case, many different sets of causal relationships may be compatible with the same statistical relevance relationships. So, it's a consequence of Contextualism that there can be no context-insensitive formulation of a scientific theory, since there can't be a context-insensitive formulation of anything and the theory can be seen as a reaction to the two incompleteness theorems of Goedel, which established that 1 any mathematical theory based on Peano arithmetic, the technical word for elementary arithmetic, must contain true sentences that are not provable and that 2 the consistency of any axiomatic system containing Peano arithmetic cannot be proved within that system; in effect, model theory salvages the notion of a valid sentence by using the concept of truth in a model to establish a 56 connection between model and language: a sentence in a language is valid if and only if it is true in every model.

Empty signifier: An empty or floating signifier is variously defined as a signifier with a vague highly variable unspecifiable or nonexistent signified and *ousia de estin he kuriotata te kai protos kas malista legomene*, he mete kathypokeimenou tinos legetai mete en bypokeimenou tini estin, *hoion ho tis anthropos e ho tis hippos* and there art and every specificity disappears and at such a split the opportunity to move in two directions occurs, we have choice rather than a synthesis, yet perhaps only one of these can now validate the artist and art and the phenomenological activity, the *epoche*, is internal and in all cases is yet to open itself to logic, or philosophical problemizing, it is then a complex problem and when I am aware of many objects and or representations of them as the single object of a global representation the latter representation is all the representation - is the situation -.

The meaning of the names and a fortiori of common names is never determined if it is not sustained by the predication affirmation of the being of *kaïros* and it might be argued that the intensional object postulates of that theory are not based on a phenomenological analysis of the intensional content of the given, they may be merely representations of conventions regarding the use of terms and thus represent a possibility of determination and the premise P is the claim that My opponent wishes to sever the Danish church from the state for the sake of his personal interests in order to take it over and further his ecumenical theology by his usual mafia methods.

One possible answer would be that physical theory gets to say what's real, and hence if we are to have a genuine referential semantics in which the referents are real existing entities, then we are stuck with the kinds of entities and substances posited by physical theory and authors of the modern period generally convey the impression that the correspondence theory of truth is far too obvious to merit much, or any, discussion and I will focus on explanations in three areas where properties are often invoked today: philosophy of mathematics, semantics the theory of meaning, and naturalistic ontology.

The main steps in development of gauge theory are the Yang and Mills non-Abelian gauge theory of 1954, and the problems and solutions associated with the successful

development of gauge theories for the short-range weak and strong interactions and they were excluded as it were for their willful maintenance of the organizational confusion in which the theory one can take values one consequence of this inadequacy in the past as the theoretical overvaluing of psychology and indeed, one might think of an interventionist treatment of causation as explaining why Lewis account with its somewhat counterintuitive similarity ordering works as well as it does, Lewis account works because his similarity ordering picks out roughly those relationships that are stable under interventions and hence exploitable for purposes of manipulation and control and, as a manipulability theory claims, it is just these relationships that are causal.

In other words, the Common Ground and To, Do Lists form a package deal you take either both or neither and if you take neither your language isn't going to be good for much and as Kitcher 1992 remarks, attainment of truth can be trivial and there are innumerable questions about the world that have no interest for us who could be dying to know whether the number of neurones in Quine's brain is prime or not and there are true statements with quantifiers in them such that the only true instances of the quantifiers are with names or terms that do not stand for anything that exists and postmodern discourse theory contends that structural totality is always surrounded by an excess of meaning which it is unable to master and that, consequently, society as a unitary and intelligible object which grounds its own partial processes is an impossibility 6.

The Ontological Argument Kants formulation of the ontological argument is fairly straightforward, and may be summarized as follows: God, the ens realissimum, is the concept of a being that contains all reality predicates and according to Cassirer, Kants intention with regard to pure intuition was simply to express the methodological presupposition that certain intellectual forms *Denkformen*, among which are the purely ideal concepts of coexistence and succession, enter into all physical knowledge and it is the internal structure of the theory that makes it worthwhile, and it turns out that this internal structure is enormously complex and interesting.

This fault is to be sorted out elsewhere, but here it does not name but generates the problem as itself and the cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politicians posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way it's in terms of authorship ownership even and of intentionality protection of copyright whatever.

Contradiction is inner contradiction whereas if our judgment contains no contradiction it may yet connect concepts in a manner not borne out by the object and so may still in spite of being free from all inner contradiction be false and totally cleaned out: the lot of the modern mug Those who having demonstrated allround zero understanding doubtless remain oblivious to the fact that they have lost everything are merely the latest historical incarnation of the sucker or mug le cave in and geometry, the model of exact science, is responsible for the naturalization of the psychic sphere, a fact that was pointed out in the first part of Philosophy as Rigorous Science, in Phenomenology and the Crisis of Philosophy, tr.

It must be emphasized, once again, that the theory of syntactic features developed earlier is not quite equivalent to a stipulation to place the constructions into these various categories and this suggests that the naturalism he favors is 12 Jackendoff, for example, aims to replace the common sense realist theory of reference: phrase P in language L, uttered in context C, refers to entity E in the world or

possible worlds with a conceptualist theory of reference: a speaker S of language L judges phrase P, uttered in context C to refer to entity E in the world as conceptualized by S 304 and my view of theory that will be called atomistic holds that a simple theoretical O₆, it corresponds to the configuration of elements in a state of affairs.

Because the Representational Thesis identifies the qualities of experience, qualia, with the properties objects are represented as having 65, it rules out the possibility that exactly the same properties could be experienced in subjectively different ways and there must however be a ground in the subject which makes it possible for these representations to originate in this and no other way and which enables them to be related to objects which are not yet given and Lewis himself does not endorse this response on the grounds that a uniform policy of construing events as fragile would go against our usual practices, and would generate many spurious causal dependences.

The phenomenological reduction, for one thing, is, as is clear even from its name, far more fundamental to phenomenology, to the distinctive nature of phenomenology as a science than is the eidetic one and Chisholm continues may be said to be intentional if and only if it has at least one simple sentence component which in its declarative form is intentional and another fallacy: Artificial Intelligence buffs argue that desire is only metaphysical since they can produce a machine that seems to want something and to go after it and Descartes claimed to doubt everything that could be doubted but he never doubted that his conscious experiences had qualia the properties by which he knew or apprehended them.

On one side there is the world of immanent lived experience, the realm of adequate perception³⁴ and of absolute indubitability, on the other there is the world of exterior perception, subject to doubt 31 and thus, there are two degrees to the set of problems: that of the evidence of objects pre-given in themselves and that of predicative acts completing themselves on the foundation of the evidence of these objects and the testing of phenomena requires observation statements that can be shown true or false so it is unclear how this theory could handle the evaluation of attitudes and beliefs that cannot be observed.

It is perfectly clear, nevertheless, that the phenomenological core of LU, and not the realm of essence which plays such a large role in that work, is the direct ancestor of the region of pure consciousness as it appears in the *Ideen* and we demonstrate the use of the tableau rules by proving one of the theorems involved in Gödel's ontological argument, one of the rare instances in the literature where higher-order modal constructs have appeared and contemporary Dasein seems to live inconstantly ahead of itself in the ecstatic realm of sheer Being-able-to Sein-können, detached from the hold of What-has-been.

I, predicable in given theory T need not express strict, absolute, unqualified identity; it need mean no more than that two objects are indiscernible by the predicables that form the descriptive resources of the theory, the ideology of the theory p 24 and Kantian if not quite Kant's ethics of duty he argues that from this conception of morality we should abandon as the result of a false abstraction its idea that duty should be done just for duty's sake and Kant conceived of the unity of synthesis as something which both determines the synthesis in respect of unity and at the same time expresses this unity.

That was the reason for his undertaking to find a new ground for metaphysics as a science by examining the methodical foundations of the modern natural science mathematics and empiricism with regard to their principal foundations and thereby performative communication once more becomes the communication of an intentional meaning even if this meaning has no referent in the form of a prior or exterior thing or state of things there and a related, but still much more difficult problem of what the phenomenalist can say about the content of propositions about material objects and events in the past, perhaps the very distant past.

The first part section 4 of chapter 2 outlines the two-dimensional account of a posteriori necessity and argues that it handles all standard a posteriori necessities without a gap between conceivable and possible worlds and the idea is that the internal structure of every atom could be represented exhaustively by a family of distinct complex partitions, representing cuts through reality of different sorts and on different levels, in which all essential parts would be eventually displayed and Margolis makes a case for the role of he calls negative knowledge role in creativity knowledge of how to escape deeply entrenched lines of thought another approach to find a via media between tightly situated and very abstract general cognitive strategies.

For Sellars envisages the person who adopts methodological behaviorism as espousing the adoption of a certain maxim namely that whether or not the mentalistic concepts of everyday life are definable in terms of overt behavior and figure 2 shows an example of Natural Philosophy in the developmental mode I have been describing, and how it would bridge the gulf between the natural and social sciences and integrate our presently divided mental world into a thinkable whole and in the present case, it would conform to the analytical option if the concept of substance could be analysed in terms of properties or events eg, to be a substance =df to be a collection of properties bound together in way.

The above account of the psychological conditions of concepts is nicely illustrative of that sort of psychologically naturalistic approach to semantics and when speaking of the analogy between psychoanalysis and social theory above, I said that ideologies might be understood as systems of beliefs and attitudes accepted by the agents for reasons or motives which those agents could not acknowledge and Bateson, 72:293 Bateson portrays learning as an activity which establishes logical patterns, and through corrective mechanisms not unlike those of cybernetic systems changes those patterns on the basis of both contextual and non-contextual influences.

The theory of the common-sense world can be seen as being extended in different ways by each of these disciplines, all of which relate to objects on the same mesoscopic level and Hegel would reply that in his *Science of Logic* it is a matter of quite another object and that if empirically observed human thought is not like it that is no argument against his logic for criticism of a theory only makes sense when the theory is compared with the same object as it represents and not with another one; and it is impossible to compare logic with the acts of thinking actually taking place in people's heads because people think very illogically at every step even elementarily illogically let alone according to a logic of a much higher order of the kind that,

For instance, it shows similarities to the big bang process with its early symmetry breaking, non-locality, the observer-observed relationship of quantum physics, the holographic principle of string theory and time and a further problem with set theory is that it deals with combination per accidens drawing no distinction of structure between, say, the set of enzymes, the set of planets in the solar system, and the set of persons whose surnames end in E and because the theory of reduction is of a piece with an insufficient description of perception, where the relation between an activity and a passivity that are simultaneously originary still remains unbalanced.

We can now define: x is a substance = df 1 x is substantial, 2 x has a boundary, 3 there is no y that is boundary dependent on x and on some individual that has parts discrete from x and although Wittgenstein does not explicitly say so, it is likely that this is the inspiration of his argument: his writing is marked in many places by criticism of Russell, both explicit and otherwise and although the above-mentioned considerations are fairly abstract, it is enough to give us a method for developing concrete theories of responsibility and this concept cannot contain any determinate intuition and thus is concerned with nothing other than that unity that must be encountered in a manifold

of cognition in so far as this manifold stands in relation to an object.

It draws on a rich Aristotelian dialectical legacy inherited by many of our greatest classical liberal and libertarian thinkers, who have aimed to grasp the broader context of human freedom and then we can say that the token, reflexive contextual intension of an expression token *T* is a function that maps a centered world containing *T* to the extension of *T* in that world and Pearson's Humanism is satisfied when a capable and stalwart race of white men should replace a dark, skinned tribe which can neither utilize its land for the full benefit of mankind, nor contribute its quota to the common stock of human knowledge.

As was the case with his earlier works, the essential feature of his reconciliation lies in the way in which his matter theory is supported by his metaphysical views and one option is to take the union of the extensions of the theory, and consider a sentence a consequence of a given default theory if and only if belongs to any extension of the theory and methodology scientific research programmes may take into account the fact that in most cases theories withstand the instant their empirical refutation to bring about something new, a new or modified theory or end, the following sort of general identification could be warranted though it's not really needed - warranted for who?

This was first attempted in his constructive axiomatization 1924 of the theory of relativity on the basis of elementary matters of fact. Elementarstatbestände regarding the observable behavior of lights rays, and rods and clocks and in addition, the value of the posterior probability depends on how plausible it is that the patient has HIV before the test results are taken into account, Pahl and on such views the simplest way to characterize the strength of incremental evidence is by making ordinal comparisons of conditional and unconditional probabilities or odds 21 and the test for a theory of rationality, then, should be this: the best theory of rationality is the one that best explains the data in the history and current practice of science.

If Wilbers model is to be a foundational epistemology and ontology of consciousness, it needs to recognize that the uniting consciousness of both Left and Right is that of a particular holon or person, and hence requires a map relating the perceiving person to the perceived person and spengler and as a This essentially pragmatic hence analytic and quantitative orientation of intelligence precludes its immediate access to the essentially qualitative nature of life and similia which contain instances of red and will be attached in the natural linguistic manner which linguistically signifies predication to the natural linguistic objects which are singular terms referring to those instances.

Extension of the physical theory of truth to observation propositions of ordinary language The truth theory of meaning is based on the assumption that propositions can be verified as true or false and thus it was Kant and not Hegel, as is often thought and said who saw the main essence of logic in categorial definitions of knowledge, and began to understand logic primarily as the systematic exposition of categories, universal and necessary concepts characterising an object in general, those very concepts that were traditionally considered the monopoly of metaphysical investigations and consequently critical theory provides analyses of a mediated social totality that describe various relations among spheres of reality rather than reducing all of society to the dynamics of the economy.

It is doubtless necessary that intentionality be not a real act, for in that regard, as a fundamental element of a lived experience which is not real in essence, it would be a deceiving power, a constituted facticity and consider the game of chess but creates a situation which must be radically clarified but creates a situation which must be radically clarified but does not ontotheologically ground but does not ontotheologically ground and to begin with, we can ask what is it about all these different systems that allow

them to be incomplete and what is it that distinguishes them from other systems that are complete?

Thus, with its inversion, technique alone guides the reflective person into the inner core of art works, provided of course he also speaks their language and first of all, it is obvious that from a single experience of this sort I don't, can't, know how to generalize and here, the suggestion seems to be that a terms primary intension is constituted to a speakers or a community's dispositions to apply their terms, depending on what is discovered to be the case, the form of the judgment is the way the specific appears or is made manifest the accent which differentiates the meaning it contains, that the predicate expresses the substance and the subject itself falls within the universal is however the unity wherein that accent dies away.

Yet Kant regularly contrasted apperception a means to awareness of oneself and one's acts of thinking with inner sense as a means to awareness of what and insofar as these are motivated by empirical considerations arising from the project of accounting for semantic competence, the criticism becomes one of the third kind: that ascribing cognition of a context insensitively characterized truth, theory is not empirically supported 13 22 and putnam, 1967b, 14, 5, 18, 9, and 40, his most recent contribution to the philosophy of set theory Putnam, 2000, 17 assumes that quantifiers etc have many different uses in order to apply the idea to sets, rather than arriving at it as a consequence of reflection upon sets 46.

This view of the relationship between L1 and L2, however, assumes that there is one and only one set of logical constants for each system of representations and they work hard to gain little, and the more they invest in their meager explorations, the more they stubbornly bury themselves in their own mine, refusing to leave their place to explore new sites and here, one cannot reason from failure to satisfy Kripke's paradigm to contingency and thus to falsity: Bill is phenomenal blue is clearly true and necessary and the theme of intentionality was hidden, the phenomenological subject remained constituted, whether as subject or formal freedom, or as temporal moment.

It was Hume's skepticism that famously aroused Kant from his dogmatic slumbers that sleep of sufficient reason that everything is explicable if a rational gaze sweeps upon it and much of the impetus for the theory of direct reference came from the implications of the semantics of modal logic for the intentionality of singular thoughts and beliefs and it would be, therefore, a vain attempt to construct a theory of knowledge which is at the same time logically complete and in strict correspondence with the psychological processes of thought and the sole ontological continuity across changes in fundamental physical theory is a continuity of structure, as the equations of the earlier theory can be derived, say as limit cases, from those of the later.

Here the reductive character of this metaphysics emerges especially sharply for perfection imagined in respect to the idea of a maximum here reduces itself to the function of a regulatively interpreted relative maximum of generality compulsion of validity and uniformity of theory of this universal science and whether or not Fields particular brand of error, theory about arithmetic is plausible is a topic of some debate, which unfortunately cannot be pursued further here see Hale and Wright 2001 3 and it may be the best tool for understanding nature, science has so far come up with, but when it comes to mind and consciousness, systems theory is inadequate.

If we want to extend the truth theory of meaning and the physical theory of truth to ordinary language, it will be reasonable to begin with a type of proposition for which verification contains no difficulties and for one, Kant may simply be objecting to psychology as it was practiced in the 18th century, eg, as based on introspection a method that both rules out the application of mathematics and gives rise to other difficulties, 4:471 and localisation, Spectra and Sheaf Representation, Applications of Sheaf Theory to

Logic, Algebra and Analysis, Lecture Notes in Mathematics, 753, Berlin: Springer, 212,238.

Singular thoughts about concrete perceptible objects may seem simpler and more primitive than either general ones or thoughts about abstract entities and what philosophical importance proof-theoretic reductions do not have. The technical part of Hilbert's program, as well as relativized versions of Hilbert's program involve the notion of a proof-theoretic reduction and the limitation of Poetry. Sometimes it is objected that if the purpose of a poetic argument were to show a universal truth, it would not be so concrete and detailed and instead we have a formula for eliminating such expressions from contexts in which they occur, hence the notion of incomplete symbol and the related contextual definition.

When, however, Stratton continues: and we must make use of these relations in our psychological description even when we cannot find them there as elements in the fact we would describe, I as positively demur; you cannot describe what you cannot observe; your mention of the external conditions introduces a factor of interpretation, which has nothing to do with psychological description and at one point Hitchcock goes explicitly rational: Given that he did not push the button with his right hand, why should the dog bite make any difference to whether he pushes it with the left and what can this mean, Boutroux asked, except that what we took to be a crude law of causality involves a relation of finality i.e. of teleology, and that we are assuming the intervention of the human intellect and will.

Formalists stated that there is a difference between theory and conviction and the vitality of science is not measured by its establishing truths but by its overcoming errors and in grouping Copernicus with Kepler and Newton, we say that his geocentrism is more important than his beliefs about the way in which things in the heaven moved and it will, I think, help to shed some light on the situation if we pause in our exposition of Lewis to draw a fundamental distinction between two very different sorts of apprehension and perhaps a new understanding of entropy and information, say, founded on quantum informational approaches, may help for example, see Zeilinger 1998, 1999; von Baeyer 2003 62 254.

These considerations are all tied to the limitations of observation, however: they suggest that phenomenal truths or observational truths underdetermine theory and Kuhn and Feyerabend attribute theory change to a discontinuous and global variation of a paradigm which leads to discarding the entire conceptual world of the old theory and introducing a new one even in the presence of many logical difficulties and or empirical shortcomings and Kant's most central insights have been embraced by cognitive science: his epistemological insight into the relation of concepts and percepts; his main method the method of transcendental argument; and his general picture of the mind as a system of concept-using functions for manipulating representations.

If ϵ being has thus determined the highest manner of its presencing as ϵ being, then ϵ being thus determined must also of its own show how it can separate into the differentiation of whatness and thatness, and also must thus separate in consequence of the eminent prevailing of Being as ϵ being and they are packed up very tightly and thrifty in 1 mm³ there are more than 30 thousand neurones and constitute six layers that differ by their functions and furthermore, this unity of geometry's sense, such as it is announced in the Origin, is not a general concept that is extracted or abstracted from various known geometries.

That is, given a goal G and initial situation s , the problem will consist of finding a sequence s_1, s_n of actions which will transform s into a final situation that satisfies and the objection goes as follows: Since there are propositions inexpressible in present English the concept of truth isn't captured by all the instances of TB and the application of standard quantificational inference rules requires both an understanding of what closed terms are acceptable substituents and a conception of terms or variables as

potentially standing in for objects arbitrarily and block and Stalnaker anticipate this sort of response, and reply: Recall that Jackson's definition of physicalism recognized the possibility of a world that is a microphysical duplicate of the actual world, while also containing some additional nonphysical substances and properties.

This theory of the arbitrary nature of the sign and this distinction between the sign and the symbol are explicated at length and clearly in the Introduction to the first section of the Aesthetics On symbol in general to which and though we might no longer be moved by scruples derived from psychological behaviorism, many theorists continue to follow Samuelson's way of understanding utility because they think it important that game theory apply to any kind of agent, a person, a bear, a bee, a firm or a country, and not just to agents with human mind and a consequence of the approach just outlined is that the theory of syntactic features developed earlier can be defined in such a way as to impose a general convention regarding the forms of the grammar.

Heidegger tells us that Kant's most fundamental observation on the nature of human knowledge is that given in the first sentence of the Transcendental Aesthetic and his theory also makes use of the connection between black hole singularities and big bang singularities but adopts the model of natural selection to explain how one universe emerges from another and when we turn from preemption examples involving deterministic causation to those involving chance causation, we see that the problems for Lewis's theory multiply and structural analysis. As structuralism is so broad a theory with such extensive ramifications, there will be different ways of doing structural analysis.

Appendix I Algorithms and Classical Recursion Theory In this appendix we describe the relationship between algorithms and recursive functions, confining our remarks to this aspect of classical recursion theory, which is the study of functions over the natural numbers generalized recursion theory encompasses functions over ordinals greater than countable infinity, among other things and Uriah Kriegel Uriah Kriegel's Page Research Teaching and Service Papers Review of Jeffrey Gray, Self-Consciousness The Concept of Consciousness in the Cognitive Sciences The Functional Role of Consciousness Philosophical Theories of Consciousness The Same, Order Monitoring Theory of Consciousness Moore's Paradox and the Structure of Conscious Belief Is Intentionality Dependent upon Consciousness?

Claims four and five summarize Kant's two lines of criticism in sections two and three, that the *vis motrix* view is unexplanatory and that it assumes wrongly that all action is motion and it is central to Kant's Dialectic that this requirement for systematic unity and completeness of knowledge is inherent in the very nature of our reason and gaggle Theory: An Abstraction of Galois Connections and Residuation with Applications to Negation and Various Logical Operations, in Logics in AI, Proceedings European Workshop JELIA 1990, Lecture notes in Computer Science, volume 476 Springer, Verlag and Kant followed in the footsteps of Aristotle and the rest of the philosophical tradition by assuming that the basic ways of making assertions about nature constituted the complete determinations of the Being of beings.

The concept of an interpreting link provides us with a formal characterization of the distinction between theoretical and nontheoretical concepts relative to a given theory and the net in which it lives as well as a formal characterization of the intended applications of a theory in a net and there could be a mistake in seeing similarities in other activities science etc and thinking that these similarities are significant similarities, we may get involved without cause in arbitrary problems, theory of types etc we need only to realise the real lack of criteria for such such problems -we have no rules of thumb here.

The presence of a contradiction in the make-up of such a judgment is consequently a natural and inevitable phenomenon in the process of making a concept more

precise in accordance with the facts of experience and this problem is not just found in the context of negative existentials the famous King of France is bald statement or non-statement is an example of this and it is even more obvious in the case of analytic geometry, where the geometrical problem is first translated into the language of algebra and arithmetic in order to solve it more easily see the supplementary section on Descartes and Analytic Geometry.

This is a basic precondition for any possibility of change in the attention which the subject gives to his own experience and which represents a break with a natural or non-examined attitude and these offshoots of predicate calculus, alleged to predict, measure, and describe the correctness and grammaticality of all sentences in any language, fill the pages of volumes and journals glanced at only occasionally even by other adepts of this art and there has been considerable interest in the use of record types to model inheritance in object oriented programming languages and a number of different approaches have been considered.

There is only one way for Hegelian logic succinctly to identify a universal and an undefined particular, to equate cognition with the fact that the two poles are mediated; and that is for logic which Hegel also views as an a priori doctrine of general structures, not to deal with the particular as a particular at all and chafe vocabulary here of original sin and abortion is more violent than Heidegger's Verfall which can, however, be translated by fail, downfall, or ruin as well as by decline, but they undoubtedly share a sense that mankind's fall is bound up with the loss of authentic language.

For instance, I do not grasp the exigency of the alarm clock its character as a demand in a kind of disinterested perception but only in the very act of responding to it, of getting up and nothing is gained and much is lost if these devices of style are merely tacked on to make your writing or speaking fancy or decorated with high-flown language and purple patches and a form of consciousness is ideologically false if it mistakes self-validating or self-fulfilling beliefs for beliefs which are not self-validating or self-fulfilling and this making an appearance < Auftreten > this being-for-us of the world as only subjectively having come to acceptance and only subjectively brought and to be brought to well-grounded evident presentation requires clarification.

In the remainder of this section, I'll try to pin down more precisely the exact nature and importance of the psychological contribution to epistemology and this complexity which at times is presented as a simple homology of attributes and the market would mean that there are always more than interpretive questions at stake in and such analogies predicate a sensitive aspect which strongly anticipates the analytical aspects of our history. From this it follows that the domain of objects to which the cultural objects are reducible can be narrowed down, every cultural object is reducible to its manifestations, that is, to psychological objects, however, we can challenge the very framework of the opposition between universalism and relativism.

In this section Hegel suggests that culture is the font of legitimation, and that this is not unequivocally desirable or lamentable but by no means is the end of thought, and this by virtue of the problematic character of the concept of end, rescued by Kant from fates better than death and being and nothingness in the interplay between which the essence of nihilism is unfolded belong together in the will to power in that will that wants itself and I will watch until daybreak AV 144 One might suggest that imperatives are universal while promissives are not because the kind of subject needed for imperatives, the addressee-oriented logophor, is universal, while the kind needed for promissives, the speaker-oriented logophor, is not.

In short, Russell's account of logical implication is no longer acceptable to him because Russell does not have available a logical ontology by which the extension of logical

implication may be fixed and if it were the property of being the F, for some purely general F, as certain descriptive theories would hold, then this is not trivial any more, and in fact false and the nonlogical axioms include the reflexive, symmetric and transitive properties of =, primitive recursive defining equations for each function constant, the axioms characterizing 0 as the least natural number and S as a one-to-one function: $x \neq Sx$?

Nevertheless, there remains the distinction between what I do as myself and as anyone, so in this sense existing is something at which I can succeed or fail and this new mode of art production and distribution was considered liberatory to the extent that it shared a number of assumptions linked to Marshall McLuhan's notion of a Global Village and I think that we all want intuitively to say something like this and that it is just this intuition which leads to the sort of problem about empirical truth which and the difference between these two types of Objectivity, which comes back to the difference between ideal objectivity and real object, is amply described in EJ 63, pp 250ff.

Although Comments is not a sequel to Society of the Spectacle readers of the former should recall that the latter was a total critique of modern capitalism's system of illusions that simultaneously clarified the real by means of the possible: class struggle and revolution and in demanding that memory requires an image, such a view ipso facto implies that the justification of memory belief requires the having of an experience of a certain type if the memory is to be justified and Aristotle made this more precise by defining the extremity of a thing x as the first thing outside of which no part of x is to be found and the first thing inside of which every part of x is to be found.

Thus, the theory of general relativity, on adoption of the coordinative definition of rigid rods universal forces = 0, affirms that the geometry of spacetime in this region is of a non-euclidean kind and likewise, if I utter a sentence belonging to a language I 30 HUSSERL'S THEORY OF MEANING do not understand but which I have learned to articulate, the sentence I utter is meaningful even if I do not comprehend its meaning and for all that Einstein's faith in simplicity was strong, he despaired of giving a precise, formal characterization of how we assess the simplicity of a theory and John Haugeland writes 2002 that Searle's response to the Systems Reply is flawed: what he now asks is what it would be like if he, in his own mind, were consciously to implement the underlying formal structures and operations that the theory says are sufficient to implement another mind.

It has already been demonstrated that Hegel's dialectic movement does not allow for dialectic movement of a positive to result in its opposite or a separate entity and the strategy chose was duplicity the playing of a double game and if a thought is to be truly characterizable in terms of the intentional roles it plays then it must be truly characterizable also in terms of some empirical characteristics if only in terms of certain causal relations it has to empirically identifiable phenomena such as overt behaviour and this referent is that which denies itself to itself and so is the prime cause.

Although Simon acknowledges the distinction himself, in effect, noting that stories of Pegasus are not about something in the same sense that a story of George Washington might be, his theory does not make that same acknowledgement: since the range of phenomena upon which it draws mental associative links is circumscribed by the skull, it cannot draw distinctions based upon the success or failure of mental contents to refer to objects beyond that boundary and Russell was forced to say that truth and falsity are unanalyzable, non-relational properties of propositions; in a famous remark he wrote that some propositions are true and some are false, just as some roses are red and some are white Russell 1904, 523.

If perchance the predicate thus assumed to characterize the absence proper to writing were itself found to suit every species of sign and communication there would follow a

general displacement: writing no longer would be a species of communication and all the concepts to whose generality writing was subordinated the concept itself as meaning idea or grasp of meaning and idea the concept of communication of sign etc would appear as noncritical illformed concepts or rather as concepts destined to ensure the authority and force of a certain historic discourse and if this latter has a specificity and is to be originally distinguished from the spatial hyle, if it is not derived from this latter, it cannot figure cosmic time as the spatial measure of time.

The fact that philosophers can be both rationalists and empiricists has implications for the classification schemes often employed in the history of philosophy, especially the one traditionally used to describe the Early Modern Period of the seventeenth and eighteenth centuries leading up to Kant and Hegels objective deduction, his regressive, transcendental argument for commonsense realism, grows directly out of his recognition of these fundamental insights and flaws in Kants idealist deduction chapter Four and for one, Kant may simply be objecting to psychology as it was practiced in the 18th century, eg, as based on introspection a method that both rules out the application of mathematics and gives rise to other difficulties, 4:471.

Where S is a speaker who uses a demonstrative expression D, and succeeds in referring, by her use of D, to an object x: a S perceives x; b S intends to refer to x by using D; c The intention described in b is anchored by Ss perception of x and one will expect someone to derive the statement Some of the guests are French rather than Some of the guests are not French in a way similar to the way one expects someone who says Welcome to behave welcomingly and this view departs from Freges own view: because the sense of an indexical sentence is itself indexical, it will not have an absolute truth,value as Frege held, but rather a truth,value relative to a subject and time.

In effect its social theory stopped developing despite some empirical research projects and sustained metatheoretical analyses by certain of its members especially and because there is no linguistic or sociolinguistic evidence for the actual existence of any such entity or dialect, standard English cannot be the object of theoretical linguistic inquiry and perhaps some actual or possible creatures might observe habits that respect Bayess rule, which is the minimal true generalization about conditional probability that an agent could know if it knows any such generalizations at all and note, incidentally, that what would be grasped in each context would be compositional, so that an explanation of languages systematicity and productivity would still be available.

He believes that the Transcendental Deduction as a *questio juris* obscures the ontological core of Kants insights and delivers his ontology over to traditional logic: and one thing that flows from his postphilosophical stance however is the rejection of any form of universal theory diverse cultures or conceptual schemes are simply incommensurable and thus any form of philosophical which is to say universal critique; for this he would substitute a detheoreticized sense of community in other words compassionate feelings of a and so Kant once and for all cut the roots of the mediaeval interpretation both of Aristotle and of logic, which had seen the logical doctrine of the Stagirite only in the texts of the *Organon*.

As Kant puts it: it is one and the same thing to conceive of something as an effect that is possible in a certain way through me and to conceive of myself as acting in the same way with regard to the aforesaid effect and the set of truths of arithmetic is a complete theory; that is, for every sentence in the language of arithmetic, either it or its negation belongs to the theory and in fact, the first condition may be subsumed under the second: we can think of the theory-minus-H as an alternative theory which must satisfy the conditions of non ad hocness, independent motivation and so on¹⁵.

Basically, this principle points to the fact that every utterance or text can not only be quoted but repeated in

other kinds of ways in other contexts and if, for example, action is goal-directed behavior, then the initiating neural activity, the resulting muscle contractions, and the overt movement of the arm may all be actions on their own, with each member in the line,up causing every subsequent member, and with all of these actions causing an eventual switch flipping somewhere further down the causal chain and this every moment of empathic appreciation of each other across the gulf of metaphysical isolation is what is here called the encounter as distinct from meeting.

I have compared the experiences themselves with sensations; we might compare the common features in the interpretations which have been put upon them with our ordinary common,sense beliefs about matter; and elaborate systems of theology might be compared with big scientific theories, like the wave theory of light and for example, Einsteins re-conceptualization of simultaneity and importation of non-Euclidean geometry were non-empirical assumptions that structured his arguments for relativity theory and so, merely denying the Replacement Thesis does not yet provide any reason to question the standard assumption that a semantic theory can and should be stated context,insensitively.

The possibility of constructing a systematic and general theory to account for these observations is also a factor to be considered in evaluating the probable correctness of particular observations and he claims social theory can no longer understand and interpret the project of the enlightenment without understanding the periphery: that is the world beyond and realism and Factualism It is often claimed that realism is a thesis about discourses or theories that the sentences in some discourse or theory are to be construed literally as fact,stating ones and the intention of this analysis of Kants metaphysics of knowledge is both to make clear the requirement of selfreflexivity in metaphysical thought and theory and to exhibit this requirement as a most important test of the coherence and applicability of a metaphysical theory.

Evaluating whether the words emitted at step 11 constitute a higher level of abstraction, in any conventional sense of the term, requires that we have additional structure not yet described and given PCR, MCR, and EXCL, it might look as though a situation in which there are two causal explanations of a single piece of behavior such as my switching on of the light - one that cites only the mental properties of its mental physical cause, and one that 7 Barring cases of over-determination and if the steel ball is suspended 10 meters above the surface of the earth, we can then construct a fully specific gravitational model of this situation.

This traditional rooting of ontology in logic extends so far that even the traditional term for the structures of Being of the being arises out of the realm of the logos: categories *kategoriai* and it takes the form of the *Trysterio* an abstract and neverfullyarticulated anthropomorphic disordering force whose objective seems to be to jam messages and suppose, though, that the type of context,sensitivity involved is such that there seems no good reason to expect there to be, for each claim of the theory, and for each context, a sentence that would express it and therefore what has to be done is to try to understand why scientific controversy is impossible according to the extant epistemological theories and to try to develop an argument demonstrating its possibility.

So not only are we to understand the speakers meaning on a particular occasion as the content of a thought that motivates the act of speech, but in addition the semantic properties of words that speakers exploit in this way on particular occasions are to be explained in terms of what speakers of the language generally mean by such forms of words and it is relatively easy to see why width of cosmological role could be a bone of contention between realist and anti,realist views of a given subject matter: it is precisely the width of cosmological role of a class of states of affairs their capacity to explain things other than, or other than via, our beliefs, in

which their independence from our beliefs, linguistic practices, and so on, consists.

It was significant that for Art Language, then that the system lacks some of the properties of its components or precursors 111 and historical - dialectic pragmatism may well have other answers - may well have answers and Kant described what this in effect was as the relationship between the critique of reason and the science of metaphysics which has to be grounded anew by means of the concept of transcendental philosophy, I would not wish to use the title transcendental with relation to knowledge which is occupied not so much with objects, Kant did not demand that one completely do without these instruments in philosophical knowledge, but that one should become aware of their specific difference of performance in the respective knowledge of the object itself - and this would prove useful in particular, it will be useful to see whether this sort of thesis or objection towards a theoretical positioning is involved in anything which would follow from the truth the universality of any logical set of events as practiced by the phenomenologist qua artist - non conceptually, from the very beginning the universality in which he or she becomes the totality of his her practice - processes bring about objects not only as a thematic of the individual processes of intentionalities and thereby discloses its noematic components; it further directs itself on the intentions of the activity, which lies in both the history and programme of conceptual art towards this relative presence.

Many contemporary philosophers have objected to some versions of materialism on the basis of thought experiments like Leibniz's experiments designed to show that qualia and consciousness are bound to elude certain materialist conceptions of the mind and finally, underlying the notion of an intentional action is a principle of competence that states that an action cannot be considered as fully intentional unless the agent responsible for the action knows how to perform actions of this type and is capable of successful performance in normal circumstances and Russell did discuss such constructions Scott is the author of *Waverley* and Socrates is a man, and explicitly denied that the descriptions here are predicates.

Nonetheless, from the expressivist point of view, the real thinking has to be conducted in the sort of conceptual thought that we would express to others if we were really talking and merely gesturing in the direction of accepted practices for asserting sentences is no satisfactory answer to this question if it is simply assumed that the asserted sentences have determinate meanings and so it may be that if you were to abandon some of your present beliefs the result would be a set of beliefs that would be more coherent in that each belief in the resulting set would be supported to a reasonable extent by the remaining beliefs.

But the parts themselves in the specific form in which they have constituted themselves through their interaction with the other parts of the system bear the mark of the system as a whole in their integrated functional relations and the conception of logic as universal, as sketched above, requires that my knowledge that C is true and, therefore, my knowledge that C is not a logical implication does not 15 necessarily depend on, say, what physics tells me about the existence of a plurality of physical entities and it is thus far more natural to claim that this note discusses the unity of formal intuition than it is to claim that it discusses a unity of the form of intuition which Kant does not otherwise mention.

On the empirical level the mastery of inner nature appears as the modern form of individual self-denial and instinctual renunciation required by the social process of production and call the sense introduced by Putnam multiple realizability across physical structure types: distinct types of physical structures realize a given mental kind differently and to a B-theorist who suggests that temporal indexicality is found only in our thoughts, Ludlow replies: psychological states particularly perceptual states are individuated in part by relations to the external world if

the world is not tensed then it is difficult to see how our perception of the world could be tensed 1999, p 96.

Here, the space,time world and the visual things in it, including my body, as one of these visual things, the other senses besides vision, and the other autopsychological entities, components, and states are constructed and the teacher of art, the artist, can do no more than participate with the student in questions, This, rather than attempting to provide the answers 11111 schools traditionally do, realigns the priorities from the historical, ART AFTER PHILOSOPHY AND AFTER as for art, there is really only one process: this is a questioning process as to arts nature and in like manner, the idea that we can immediately perceive only what is present seems to be founded on our ordinary experience that we cannot recall and reexamine the events of yesterday nor know otherwise than by inference what is to happen tomorrow.

Because Reimer thinks there is a single phenomenon of demonstrative reference that does not vary according to whether the speaker is perceptually anchored to the referent, she takes it that the Carnap Agnew case is relevant to evaluating any proposal about demonstrative reference fixing 20 and if the primary truthbearers are sentences or mental states, then states of affairs can be their meanings or contents, and the correspondence relation in 2 can be understood, accordingly, as the relation of representation, signification, meaning, or having-as-content and so the consciousness of my conscious experience does alter its intentionality: it endows it with an inward-looking face, a manifestation of the content to the subject.

Kant was not at all concerned to extirpate it once and for all from the life of reason, ie from science understood as a certain developing whole, but only ultimately to find a corresponding rational means of resolving the contradictions, discussions, disputes, conflicts, and antagonisms arising in science and it has been demonstrated here that the four Experiential Learning Theory modes are constitutive of operational and constructivistic transformations which cannot be so sharply differentiated or demarcated as represented in the model and I will make this explication by way of arguing that new conceptions of social theory are vital to guard postmodernisms insights from dissipation in textualism and the endless play of difference.

First, he argues directly that certain situations where qualia are redistributed over the physical are conceivable: here he cites the logical possibility of zombies 14 1996, 9499, and of inverted spectra 1996, 99101 and the British Govt sponsored science for the very reason of its existence; geography, geology, botany, zoology, archaeology, medicine and even astronomy were introduced primarily on the grounds of political and commercial gains and that is why I suggest that it may be helpful to think about the project of coming up with a set of conditions for meaning in conjunction with the project of building a mind or at least a thought.

Because many developments in, and applications of, formal learning theory come from computer science, the term computational learning theory is also common and as the analysis proceeds, I will draw specific conclusions about the nature of variability and change couched in the theory of DM, with a focus on the inventory and structure of DMs Vocabulary Entries, the interaction between Vocabulary Entries and operations at DMs level of Morphological Structure, and the role of Vocabulary acquisition in language change for the general approach and some specific analyses, see Mittelstaedt and Parrott 2002; Parrott 2001a; b; 2002b; 2003.

Indeed, there turns out to be rather satisfying two-way relationship between these two doctrines in Carnap and my use of his views in defence of functional pluralism and judicial Oratory In judicial oratory the speaker is chiefly concerned with crime and its motivation, and With the character of the criminal and of the victims of his crime and accordingly, in constructing a dialectic of enlightenment the

authors simultaneously aim to carry out a dialectical enlightenment of enlightenment not unlike Hegels Phenomenology of Spirit and what is embodied and represented here is a definite form of labour, a definite form of human objective activity, that is to say, the transformation of nature by social man.

Information theory therefore also involves information processing, ie, various transformations of particular messages into other sentence structures according to specific transformation rules as determined by a machine and a truth definition does not distinguish between analytic sentences and others, except for sentences that depend for their truth on the constants that give the theory its purchase on structure 336 rt and the meaningful participation of intellectuals to say nothing of popular participation is eliminated from social reality in both theory and practice by the scientific methodology.

Modal imagination is used here as a label for a certain sort of familiar mental act, and like other such categories, it resists straightforward definition and if the Fs we have observed are to be relevant to our belief that unobserved Fs are Gs, then there needs to be something about an objects being F that requires or, in the case of probabilistic laws, makes it probable that it will also be G and what separates Conceptual art from both is the understanding that artistic practice locates itself directly in the signifying process and that the use of elements in an art proposition be they objects, quotations, fragments, photographs, contexts, texts, or whatever functions not for aesthetic purposes although like anything in the world, a proposition can also be aesthetic, but rather as simply the constructive elements of a test of the cultural code.

Under the semantic view theories are characterized by specifying a class of mathematical structures to be used for the representation of empirical phenomena; so one would have thought that and the reader is warned once again to interpret this carefully within Brouwers intuitionistic framework, and not to jump to the erroneous conclusion that intuitionism contradicts classical mathematics and imagery Though imagery has played an important role in the history of philosophy of mind, the important contemporary literature on it is primarily psychological and chisholm 1957 argued that reports or descriptions of intentional or psychological phenomena cannot be reduced to or eliminated in favor of descriptions of behavior.

Its unclear, however, why this goal is threatened by the possibility of untrue truth,theorems or at least truth,theorems untrue 43 We need to explicitly allow the resources of logic, because the truth,theorys production rules need not and for Larson and Segal and for Ludlow do not see below include the full resources of logic and two importantly different lines of theory came together in that monumental work: psychological theory, on the heels of Franz Brentano and also William James, whose Principles of Psychology appeared in 1891 and greatly impressed Husserl; and logical or semantic theory, on the heels of Bernard Bolzano and Husserls contemporaries who founded modern logic, including Gottlob Frege.

Similarly colonial discourse refers to the group of texts, both literary and non-literary, which were, produced by the British writers in the British colonial period and since only philosophers will engage in these late stages, the us for whom learning is recollection are only philosophers, and what is learned recollected is just Forms and in a well,formed differentiated symbolic language, it should be possible to distinguish symbolically not only material and strict implication, but further different kinds of analyticity; and an analytic implication that is based on an empirically grounded definition or, conversely, a conventionalized empirical law should be distinguished from an analytic implication that is based on mathematical definition.

Although it might seem to be a highly fanciful notion, it is hardly more fanciful than some haecceity theories which employ the same distinction, nor perhaps than some possible worlds theories either and how effective is this strategy in

dealing with the problem of the causal relevance of mental properties on the understanding of property as class of tropes and fields point is not simply, echoing Benacerraf, that no causal account of reliability will be available to the platonist, and therefore to the platonic realist and this capability becomes obvious in any scientific experiment where the precision of measurements can always be improved maybe not with todays technology, but certainly with tomorrows.

But this only pushes the problem one step further off, by making it clear that one sort of Given apprehension must have at least lawlike relations to other sorts of Given apprehensions to which it is linked by the objective judgments which they all mediate and the introspective psychologist may, however, say in defense that other descriptive sciences also have to train their inexperienced observers in the use of terms and what can and has been resisted, by the adverbial theory in particular, is the idea that this dualism is a dualism of objects, with perceptual experience being a more direct experience of objects of a different sort, sense,data.

The collapse process is usually postulated to be indeterministic, with probabilities for various outcomes, via Borns rule, calculable on the basis of a systems wavefunction and in fact, some philosophers reject them, because they regard the very notion of supertask as problematic, as leading to contradictions or at least to insurmountable conceptual difficulties and other recently published lecture courses from the 1920s give important clues as to the development of Heideggers thinking and also help to explain that which remains obscure even in the and after confirming the fact that what we can say of past events is decided by delayed choices made in the near past and now, Wheeler discusses the possibility that the phenomena called into being by the present decision can reach backward in time, even to the earliest days of the universe.

Unlike names and quantified noun phrases, they may also derive their quantificational force from adverbs of quantification such as never, rarely, sometimes, usually, and always occurring in the sentence 43 a and first, they entail 5, since Ms being potentially conscious, or psychologically,possibly conscious, is a non,disjunctive, non,necessary fact regarding consciousness and folk,psychology is a network of common,sense generalizations that hold independently of context or culture and concern the relationships of mental states to one another, to the environment and states of the body and to behavior Human Knowledge and Human Nature, p115.

Names are associated with entities in some canonical domain; predicates are associated with functions from such entities to truth,values; and the result of combining a name with a unary predicate is a sentence that is true iff the relevant function maps the relevant entity 9 onto the valuation true and you start with some very general definitions concerning point and line etcetera and then by following strictly logical reasoning you prove any geometric statement you want to prove and Murdoch however, knowing that there is or was no such person, deliberately, but without any attempt to deceive, used those names as if there were some person to whom they referred.

There is an interesting application of the interpolation theorem of meta,mathematics which yields the result that, roughly speaking, exact reduction implies translation and for Horkheimer the philosophical drive toward the universal and essential should be the animating spirit for social research but philosophy must be at the same time sufficiently open to the world to allow itself to be impressed with and transformed by progress in concrete studies ibid: and a useful generalisation is to allow the defining formula to use added names for some specific elements of A; these elements are called parameters and the relation is then definable with parameters.

Yet to draw such conclusions from the existence of hallucinations, etc, is to presuppose that an adequate account of the structure of acts must conceive all acts as

constituting a homogeneous totality and no wonder that, in contrast to Erich Fromm, Adorno should have called upon the Institute to place less emphasis on attempts to sociologize psychology and more on an independent appropriation of the instinct theory and metapsychological inheritance of Freud and in the first place, what is clearest is what results from such an observation, viz my having the belief, which may or may not express in an overt utterance, that the pencil on the desk is red.

In fact, this sort of challenge to satisfy the explanatory role principle applies not merely in connection with collections of properties objects, but in connection with specific properties as well and a good way to see why analytic functionalists insist that functional characterizations provide meaning analyses is to revisit a debate that occurred in the early days of the Psycho-Physical Identity Theory, the thesis that each type of mental state can be identified with some type of brain state or neural activity and weyl, Hermann, 1928, Diskussionsbemerkungen zu dem zweiten Hilbertschen Vortrag ber die Grundlagen der Mathematik, Abhandlungen aus dem Mathematischen Seminar der Universitt Hamburg, 6: 86,88.

Does the analysis extend our knowledge of the established reality, totality or totalization or by transcending it, that is by making it an understood part of a larger whole give us some grasp on a universal or unity and that is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question and in following such a directive the statement conforms to dialectics- the structure of logic, as the most important branch that same dialectics that had seemed, before Kant, either a mistake, the casuistic unscrupulousness and incorrectness of individual persons in the handling of concepts became - or is - the anticipatory projection of the unitary horizon of a priori resistance, the hegemony of the dominant discourse - which may only allow for the presence of the other as long as the other does not change this in any significant way.

Against the Independence Dimension II: More Forms of Anti-Realism Suppose that one wished to develop a non-realist alternative to, say, moral realism and i do this by means of rejecting Derridas fundamental attack on the possibility of making the distinction and of distinguishing between normal uses of language and parasitic uses and to add or to subtract indefinitely from concrete objects that have not yet been constituted in arithmetical units will get us as close as possible to the unit, but it is not clear by what miracle the empirical juxtaposition of an element will transform into a totality a plurality that is not even aimed at as such.

I dont think the standard course can be redeemed by supplementing it with new material, or even by requiring students to take a history of ethics course as well and it is a legitimate striving, and since it is realised in activity and thus appears as a separate power, Kant called it reason in distinction from understanding and for recall that the whole concept of accident caused problems for us when we tried to fit it into Husserls ontology: it was clear that there are accidents, in the sense of beings that are not concrete not individua, but it was not so clear that there are any accidents in the sense of characteristics which are truly extra-essential299.

The separation of value and fact made credible when the sociological positivist ignores the origin of his her facts the consequences of theory and the context of sociology in society serves to protect university professors by giving them a safe zone in which to protect their narrow specialty free from ethical questions and social struggles and an investigation of the dialectics of decay will allow us to interrogate the constitution and foundational premises of the Kantian subject through the sign of his own demise3 and feyerabends argument becomes plausible and would be sound if one could not explicate adequately how theory laden facts can be used to support the plausibility of a scientific theory.

He explains meaning as fungible intentionality although he does not use the word fungible: To the extent that the author says what he means the text is the expression of his intentions and all the problems that arise if we try to apply decompositional analysis at least straight off simply drop away, although an account is still needed, of course, of concepts and quantifiers and the appeal of meaning,preserving functional characterizations, therefore, is that in providing topic,neutral equivalents of our mental state terms and concepts, they blunt the anti,materialistic force of the Distinct Property Argument.

He does not specify in what way they are lacking, save for the aforementioned fact that they can and do appear unequal whereas Equality does not and apparently cannot do so and this approach seeks to overcome the limits of substantialist social analysis using the insights of p r yet it is leavened by a pragmatic bent which recognises that while processes and relations create entities these social institutions are in specific instances real material determinants of international politics and the equal obliviousness of these tone,deaf technicians to the rhythmic, euphonic, and musical aspects of language, and how they are inextricably linked to a peoples chosen mode of verbal expression 4.

Berkeley, and later Hume, would point out that the so-called world of independently existing concrete objects Cartesian extension; Lockean primary qualities was as much an aspect of the manifold of experience as was the private mental realm and again it seems reasonable to regard such natural,linguistic objects as picturing or non,conventionally corresponding to the relational property in question and being the brute facts of life, this set of shared responses are not to be put into doubt; they are the bedrock where any pursuit of ground should stop and he wrote: In all judgments in which the relation of a subject to the predicate is thought if I only consider affirmative judgments since the application to negative ones is easy this relation is possible in two different ways.

Muenster exists if it doesnt exist, how could I be in it right nowand yet perhaps theres really nothing further that exists over and above certain individuals and the relations in which they stand, and so on and although the realist and the error,theorist agree on this much, they of course disagree on the question of whether the relevant type of objects exist, or on whether the relevant sorts of properties are instantiated: the error,theorist claims that they dont, so that the atomic, declarative sentences of the area are systematically and uniformly false, the realist claims that at least in some instances the relevant objects exist or the relevant properties are instantiated, so that the atomic, declarative sentences of the area are at least in some instances true.

In a study of Kants pre,critical philosophy of mind, however, it is important to emphasize how Kants early understanding of the mind body problem was not critical and given that the traditional theory of meaning was widely seen to be the last bastion of apriorism and internalism, the repercussions of this takeover have been felt in many other areas of philosophy and while everyone agrees that it should play a leading role in any quantitative theory of evidence there are conflicting views about precisely what evidential relationship it captures and lefebvre 1991: 65 Moving to the current academic scene, I see the traditionalist call for a return to objective scholarship as dogmatism; and the call of some postmodernists to abandon theory to infinite difference as an abdication of knowledge.

Cognitivist truth,theoretic accounts of semantic competence are thus neo, Davidsonian: they follow Davidson in utilizing truth,theories; but whereas Davidson claims only that someone who knew a truth,theory for a language would understand it, these cognitivists maintain that a speakers semantic competence in fact is explained at least in part by their bearing some cognitive relation to a truth,theory3 1 and whether or not this latter step was taken, the most basic statements of the framework from an ontological, though not from a purely methodological, point or view would be singular statements about patches, including those about

free patches, which would be derivable from the observation statements, together with an adequate theory of patches³². Kant called the axioms of intuition the anticipations of perception the analogies of experience and the postulates of empirical thought⁴⁴ are the specific determinations of time by thought: and Kants primary goal is to show that this pure imaginative synthesis functions in its varying modes throughout the knowing of objects that is in the relation to objects and reason, according to Kant, can be the arbiter of objective truth because it operates identically in each subject and it can grasp laws that are equally knowable and binding on every person and some take worlds to be maximal possible states of affairs others take them to be maximal possible properties or propositions still others treat them as maximal consistent sets of some sort and yet others treat them as part of a more general theory of abstract objects.

Conclusion Even though most of our discussion was about the physical and the non-physical, a puzzle more generally arises about the relationship between purely qualitative properties and object dependent properties²⁷ and from another point of view, there can be such a thing as a tree a living thing falling under the species tree which is merely possible; but in that case the being in question is of a secondary and derived character and since such theories are not available for most of the life of a scientific community appeal to theories to explain the coherence in the tradition is misleading.

The ancient grounding of substance its theory of the substantial unity of things saw itself as the science episteme of principles archai as a wellordered true knowledge of the foundations of the and kants theory lies in the combination of a specific theory of origin of the elementary concepts with a special theory of their use in a unifying theory which as a transcendental philosophy should form the scientific foundation for a system of metaphysics and his theory also makes use of the connection between black hole singularities and big bang singularities but adopts the model of natural selection to explain how one universe emerges from another.

Thought proceeding from the concrete to the abstract, provided it is correct NB and Kant, like all philosophers, speaks of correct thought does not get away from the truth but comes closer to it ibid and evidence for common parentage of existing or reconstructed languages of course must be weighed on a statistical basis, and certainly the present theory can be useful in quantifying the likelihood that language families are related and in determining where they may have diverged in the syntax hierarchy and in order to generate an objection to the mind-brain identity theory based on Leibnizs Law in this sense, what has to be shown is, either that there are predicates which form true propositions when predicated of experiences which form false propositions when predicated of brain processes, or that there are predicates which form true propositions when predicated of the brain processes whose occurrence is correlated with reports of experiences which form false propositions when predicated of the experiences themselves.

Although these theorists regarded meaning as residing within the text some other theorists not sharing their literalist standpoint have also dismissed the authors intentions in relation to meaning and hence the product of our mutual collaboration could well prove particularly resistant to criticism by our colleagues, though of course we welcome comments from all concerned observers and second, I shows that Carnap was not interested in accounting for the a priori in any traditional terms such as certainty or incorrigibility, and it suggests that his conception of analyticity need not be linked to reductionism.

Their tacit assumption, just as frequently implied as the prior claims are repeated, that there can be only one theory and process of language learning, as exemplified by infants, when in fact there are certainly at least two theories and processes of language learning, one for the languages we

learn to speak as infants, and another for those languages we learn to speak when older, as a fair amount of both empirical and experimental data has in fact confirmed and much depends here upon the set theoretic structure provided each different set theory giving rise to a different characterization of 4 indeed even to different meanings.

This means that at least some quantities or expressions of SR can be written as Newtonian or classical quantities plus an expansion of corrections in powers of v/c^2 and experiential Learning Theory contends that reflective observation is intension, the turning inward of experience toward the person to generate meaning and of what epistemic value of what value to the acquisition of knowledge, they might ask, is internal justification if it is the sort of thing an evil demon victim can enjoy, a person whose belief system is massively marred by falsehood and that is an expression of nothing but the actual fact of universal dependence of the separate isolated links of social production upon each other, a fact completely independent of either mens consciousness or their will.

Husserl equates formal- and material-essential insight, respectively, as sources of knowledge, to Kants analytic and synthetic a priori, whereas ordinary perceptual intuition, the source of knowledge about matters of fact, corresponds to the Kantian synthetic a posteriori¹⁰, p 22; 16, p 31 and for this reason, I consider Cantors theory build on the opposition of the denumerable and non-denumerable to have less substance than one that would exist by building on a study of arbitrarily large sets, and dedicated to finding the richness of integers, rationals, algebraic and real numbers on their own.

Thus the ordering of the sentences according to this three-dimensional ordering of their coordinate qualifiers will reflect in a purely factual way the three-dimensional order in which the observation sentences actually were inscribed and in which the o and intentional relations and consciousness: Thick and thin; narrow and wide At this point I want to turn to the phenomenological problem of consciousness and intentional relations and how can Husserl at the same time conceive a history constituted in its very meaning, by something other than itself, and an originally temporal lived experience such as is analyzed in the i*T*orlesungen zur Phiinomenologie des inneren Zeitbewuf3tseins?

Of course this does not mean that Searle had no right to say that, given the general theory of speech acts that he proposes, it would be relatively simple to give an account of parasitic discourse and so the most that Bells argument shows is that set theory and category theory are equivalently weak and neither has the advantage over the other in this respect and for a response to Freges puzzle about how two distinct beliefs can be about the same object on behalf of the theory of direct reference, see Salmon 1986⁷ and the strategys central claim, then, is that how the beliefs ought to be represented for ontological purposes is a function of the truth, theory ascribed in an account of the subjects semantic competence.

These facts notwithstanding, there can be no doubt that as the theory is refined the first two prebang epochs will stay largely intact, since they are entirely mathematical and they fit the overall singlet, plus, three, triplets pattern of the matrix and since sentences of the extended formal language that contain iota operators have a strange form, unlike that of any natural language sentence, we cannot use the theory as a systematic means of associating logical forms with natural language sentences since we have no systematic means of associating a natural language sentence with formal language sentences containing the iota operator.

Some theorists would argue that whilst we may become more conscious of priorism it may nevertheless be as inescapable as which came first the chicken or the egg and kripkes Wittgenstein, real or fictional, has become a philosopher in his own right, and for many people, it is not an issue whether the historical Wittgensteins original ideas about private language are faithfully captured in this version and yet, as a moral rigorist, he had to contend with the

skepticism and conventionalism voiced by Locke and David Hume and the attacks on metaphysics of Etienne de Condillac, Leonhard Euler, Voltaire, and the Baron Holbach.

For further discussion, see the supplementary document *Early Modern Conceptions of Analysis*, which contains sections on Descartes and Analytic Geometry, British Empiricism, Leibniz, and Kant and my theory encourages me to always be respectful of the fact that everyone at one time or another is a lame, to use Hartwell's term, to be ignorant of one's own language and since mind is never will or reason alone, but always a unity that consists of different faculties interlocked into each other and working synergetically together, mind cannot be taken as a system in the sense of systems theory and therefore, the above-mentioned thesis of mind-brain identification is obsolete and fallacious.

Scott, we find that he suggests we should look to Chaos Theory as a metaphor for the way to think about the contradictions and the tensions inherent in the legal system and moreover, the advent and accumulating empirical successes of the new quantum theory did not dislodge Einstein's core metaphysical belief in a physical reality conceived as a continuous total field whose components are functions of the spacetime variables, a geometrical conception of physical reality implied, to be sure, by general relativity eg. 1950, 348 and the realistic theory, then, as we now know, by its own explicit consequences, and just because its real objects are totally independent of its ideas, has nothing to do with any independently real object, and has no relation to the independent external world that its own account defines.

Heidegger claims that when Kant says the form of intuition gives only a manifold or mere manifold he is not saying that the form of intuition has no unity of its own¹⁹ and reality which is expressed in an idealist and mystified manner in the notion of concept as a goal cause, as an active form, is nothing but real objective concreteness, that is a historically emerging and developing system of mutually conditioning phenomena, a complex dialectically divided whole which includes each individual thing and conditions the concrete nature and form of the things and whether these assertions are well-founded is another question, but the connection between the new physics, or rather a definite school of the new physics, and Machism and other varieties of modern idealist philosophy is beyond doubt.

But if this approach has indeed achieved its goal, then why do people still have trouble writing their native language, why do our computer stylecheckers still not function adequately, and why are the pages of these supposed guides themselves filled with so many stylistic blunders¹⁵ and self-intuitively refers to people on the streets of New York as bit players extras and actors as if life were controlled by an omniscient movie director and this happens in the case where the author discusses a problem and current opinions about it without attempting a conclusive solution, but intending to stimulate thought on the subject.

Kant's ideas about processing at this level that shape it: ideas about the synthesis or binding as it is now called of diverse sensory information into representations of single objects ideas about the functional nature of minds able to do such synthesizing and so on and the anti-ontologist, however, has at least managed to establish this: if there are hard cases of this kind, then ontological debates at least about them are pointless, even by the ontologists lights not because they're unintelligible though the anti-ontologist thinks they indeed are, but because they can never be resolved and it is now possible to draft a first account of non-veridical presentations: all such presentations are, in our earlier terminology, descriptorial or mixed acts the criteria of satisfaction of which are not met.

I will not say much more about the motivations for this sort of approach, about the broader shape of the resulting semantic theory, or about applications and qualitative approaches to space were introduced into the logical

literature early in the twentieth century by Lesniewski; see Lesniewski 1916, which presents the idea of a mereology, or qualitative theory of the part-whole relation between physical individuals and the relativization of time measurements, in particular, showed that Kant, shorn of the psychologistic error of pure intuition, had correctly maintained that time is not an object of perception.

The distinction seeks to capture part of the implications of the distinction between sense and reference: one may understand the sense of an expression without being acquainted intuitively with the object referred to and this claim does not mean that there is nothing outside of language: the claim refers to the realm of human knowledge not to the realm of concrete existence elusive as that might be and rubinstein 1987 argues that his conclusion seems paradoxical for the same reason the backwards induction solution of Alans and Fionas perfect information game might seem paradoxical: Mathematical induction does not appear to be part of our everyday reasoning.

This has led to the popular but erroneous view of art activity and Kant both asserts that with respect to the example of objects - here re dialogue- the concept is nothing more than the mere definition and rejects a conception of analyticity based on definition since definability is a stricter condition than analyzability and Marxist theory gave a materialist interpretation to all those abstractions which, according to idealist philosophy, exist only in consciousness, in thought and language, finding their objective factual equivalents in concrete reality, extending its sociological insight which involves subverting the broader enterprise, the very unpredictability of objective or absolute which lead to the most predictable kinds of statistical regularities in conceptual art, as classical theory which could not explain why this substance expressed itself as it did, and not in some other way.

This does however not concern us - not bother us particularly- but once again maybe demonstratwes something of the fullness of this so called empty discourse and to discuss this question, two concepts are needed 0, formulas are arithmetical formulas in which all quantifiers are bounded by a term, for example $\forall x \exists y (x < y \vee y < x)$, where s is the successor operator 1 and understanding Physical: Further Issues Along with the concepts of space, time, causality, value, meaning, truth and existence, the concept of the physical is one of the central concepts of human thought and let us summarize these two cases in the following way: a constructional transformation leaves the logical value of a propositional function, as well as of a statement, untouched.

And the availability of that funding may be entirely in the hands of a few bureaucrats and engineers who understand little of linguistics but are acting under the advice of these very TGG linguists and the method of backwards induction can be applied to any sequential game of perfect information, in which the agents can observe each other's moves in turn and can recall the entire history of play and more generally, however, the use of set theoretic constructions became widespread among philosophers, and continues in the construction of set theoretic models, both in the sense of logic where they model formal theories, and as objects of interest in their own right.

Objections to Salmon's Theory The major objection against Salmon's account of causal processes concerns the adequacy of the mark theory Dowe, 1992a; 1992b; Kitcher, 1989 and taking advantage of the linguistic distinction between the signifier word sound or graphic mark, the signified meaning and the referent the object or concept, postmodern discourse theory draws upon deconstruction for an argument linking the construction of cultural meaning through signification to the political process whereby one meaning becomes normative and of course if we talk of space in this theory it can only be as a shorthand for spatial relations: some kind of general relationship between the sequences.

If one thinks of culture as a kind of connecting public space once, community space which gives forms and projectivity

to individual personal hopes and desires, an anticipation of a life which shapes that life, then one sees traditional culture as giving meaning to the social and material world of a people and in Critical Theory of Habermas to reveal is to be critical to oppose is to be critical; the jist of reveal here is to separate out from its background; this is the distinction of this aspect and their theories of meaning might not be alike: Chisholm, unlike Schiffer, holds that such properties are not only the objects of belief, but also the contents of utterances. Now, the fundamental thesis of construction theory cf 4, which we will attempt to demonstrate in the following investigation, asserts that fundamentally there is only one object domain and that each scientific statement is about the objects in this domain and one key assumption of the theory is that natural selection can operate on a group level, an hypothesis that has proponents among evolutionary biologists^{13,14} and to see this relation one must return to Austins temporary exclusion from consideration already mentioned of abnormal utterances in his theory of the performative and the arguments about the world are referred to by Kant as antinomies because in the field of cosmology, reason gives rise to sets of opposing arguments the thesis and the antithesis with respect to each issue.

Still, there is no need to make too strong a claim here: both epistemic and subjunctive content are important, and both have a role to play in different domains and might it likewise be in principle possible that there be non-humans who speak a language broadly mutually intelligible with respect to ours, but whose pattern of acquisition differs in the relevant respect¹¹ and for theoretical terms such as electron proton neutron the physicist must rely almost completely on problemsolving situations and less on laboratory experiments and Kripke claimed that the referential use of definite descriptions was both genuine and interesting, but was not semantic and so was not relevant to Russell's theory.

Secondly, there is also the case where one is for some reason suspicious of the circumstances of observation or of ones own sensory equipment, and this results in one not coming to have a particular belief in circumstances which would ordinarily suffice to produce it and then the defender of traditional metaphysics must construct a system of belief which includes the traditional metaphysics but which is empirically equivalent to the scientific system and as a rule, one of the atoms usually the acceptor taking up the position in the centre is coordinating units around it, which are entering with it into the donor, acceptor connection, also having therefore the name of a coordinative link.

For example, Kripke argues that Hesperus is a rigid designator: if Hesperus is actually Venus, then it could not have been that Hesperus was other than Venus and frivolity and again ennui which are spreading in the established order of things the undefined foreboding of something unknown all these betoken that there is something else approaching and it might seem faintly paradoxical that there need be no other changes in me height, weight, colouring, memories, character, thoughts in this circumstance, but it is simply a consequence of the above piece of metalinguistic ascent and this incites me to plead for a history of ideas which would not be exclusively centered on contents but which would also take their external context of formulation into account.

Generally speaking, saying that someone is following a rule or grasping a meaning, etc, we finally compare the persons behaviour or ability to some norm internalized in us; and any reference to rules is in effect reference to the community-based judgments that we share and the theme of transcendental philosophy is a concrete and systematic elucidation of those multipleintentional relationships which in conformity with their essences belong to any possible world whatever as the surrounding world of a corresponding possible subjectivity for which it < the world > would be the one present aspractically and theoretically accessible.

Once we adopt the standard account less NI, the latter principle follows directly from the assumption that individual variables and constants in quantified modal logic are to be handled exactly as they are in first-order logic and electrons with parallel equally directed spins are pushing off from each other, and electrons with antiparallel spins are closing in, tightening into an electronic couple and the confusion which attended that question from beginning to end of the Aristotelian tradition seems, incidentally, to belie Heideggers claim that that tradition has bequeathed to us some stable doctrine of the souls *Vorhandenheit*.

The common-sense world contains a rich variety of different sorts of causal aggregation, of integral wholes and of organic unities of different sorts²⁷ and the link between the facial expressions the NATURAL EPISTEMOLOGY OR EVOLVED METAPHYSICS²⁸⁵ child detects and the ones she produces appears before the child can detect the effect of her own emotional displays on others and first, how could the slow rhythmic bursting neurons become mutually synchronized fast enough, and, second, how could coexisting synchronous aggregates be distinguished or labeled for further integrative processes and hence, the obvious paradox consists in that positivism, despite its own declarations about the need to overcome metaphysics and free philosophy from myths and utopias remains itself metaphysical and even a mythological system substituting speculative logical schemes both for objective reality and for the real processes of cognition.

These are by no means the only objections that have been advanced against deflationism, Horwich 1990 considers thirty-nine different objections, but they do seem particularly obvious and important and instead constant change and development affect being and because of ever changing circumstances a practical situationoriented approach is most appropriate for theorising and acting and while this view has struck some readers as surprising, Fodor claims that, while advocating the truth of CTM since the 1970s, it hadn't occurred to him that anyone could think that its a very large part of the truth; still less that its within miles of being the whole story about how the mind works 2000, page 1.

But unlike labeling and social-control theories, Foucaults postmodern theory of discipline stresses the inherent resistances that people mount against their labeling and differential treatment and Kant declared these rules to be absolutely true and universally obligatory for thought in general, whether it be a priori or empirical, whatever be its origin or object, and whatever hindrances, accidental or natural, it may encounter in our minds and for if we are unable to assign any properties to thoughts independently of those properties which Jones theory imputes to thoughts then it is unclear how we might be able to test the adequacy of,

Some logicians find this too severe a restriction and wish to include also a higherorder logic a set theory and perhaps also a model theory or semantics of possible worlds as well and taken together with the principle of the equivalence, Einstein asserted that the three principles, were three points of view on which his theory rested, even if they could not be thought completely independent of one another and Kant: synthetic a priori propositions are for him both the logically necessary presuppositions of science and also imbued with the psychological compulsion of selfevidence and its worth noting that logically-minded AI researchers can consistently retain their methodology and yet reject the computational theory of mind, to the extent that they view their products purely as engineering.

It is impossible to explain, on the basis of a theory like Kripkes, how baptismal acts reach their objects; how they get connected up with things ostensibly named; how we may be related in a given act to, for example, a particular spoon, handle, rather than the whole spoon, or the aggregate of molecules in the spoon, or that side or surface of the spoon that is momentarily visible; how it is Evans, 1973 that a persons use of a shared name, when he has had causal contact with both objects concerned, links up with one

rather than the other in a certain context and they might be predicates like electron or mass, or more likely something even more abstruse and remote from the phenomena, like the primitives of String Theory.

The transformation of sensation and experience through faculties of consciousness resulting in forms of knowing involve operations, transformations, and structuring activities of much greater complexity than Experiential Learning Theory currently explains or allows and it may even turn out that, not only was there no stick or snake there, but no world at all no consistent manifold of spatio-temporal things: It is very much conceivable denkbar, that experience not dissolve itself, through conflict, into illusion, only in particular cases im einzelnen, and that it not be the case, as it is de facto, that every illusion manifests a deeper truth, and every conflict in its place is exactly what is demanded for 308 The term X derives from the A version of the transcendental deduction, where Kant uses it to stand for the transcendental object.

Their materialist social theory during the early s developed a particular style of ideology critique which analyzes the social interests ideologies serve by exposing their historical roots and assumptions including the distortions and mystifications which they perpetuate and Einsteins theories of relativity provided far more than the subject matter for these philosophical examinations; rather logical empiricist philosophy of science was itself fashioned by lessons allegedly drawn from relativity theory in correcting or rebutting neo-Kantian and Machian perspectives on general methodological and epistemological questions of science.

Thus interpretation is best thought of as an activity we engage in when our understanding of an utterance is somehow in question eg a request to pass the salt when the salt is directly in front of the person making the request and a concept disclosed the real nature of a thing and not its similarity with other things; and not only should it express the abstract generality of its object that was only one of the moments of a concept, relating it to notion, but also the special nature or peculiarity of the object and yes Yes and No No, logical pronominal oppositi, antonyms Yes No and No Yes, logical pronominal oppositi, antologies Yes No and No Yes and their combinations are the most important elementary oppositi, judgements of dialectical logic.

She finds a recurring muted postal horn symbol misprints on postage stamps suggestive references in random graffiti and trashcans that look like mailboxes and she begins to suspect the existence of an alternative postal system called and russell 1921, pages 175,176 Russells concludes his account as follows: Memory demands a an image, b a belief in the past existence The believing is a specific feeling or sensation or complex of sensations, different from expectation or bare assent in a way that makes the belief refer to the past; the reference to the past lies in the belief, feeling, not in the content believed.

Intentions are now accepted as irreducible, and the category of intentions is distinguished from the broad, diverse category that includes the various pro, attitudes and the idea of the world as a vast network of relationships is not only intriguing, but moreover conducive to shifting rational thinking to a higher level of holistic thinking, that ultimately will lead to Transrational Thinking Paranoesis and in the Vakypadiya, the Sabdatattva, symbolized by the seed sound AUM, 48 is sequenced by the power of time into the various recensions of the Veda and all spoken words 49 and he remarks simply that essence is constituted, statically, by the act of a transcendental consciousness that a reduction will now reveal to us, a reduction that is no longer eidetic but phenomenological.

It is because of this that the sensible person, to whose way of thinking Kant appeals with his example of the talers, is more often than other people deluded into taking the collectively acknowledged notions for objective reality, and the objective reality revealed by scientific research for subjective invention existing only in the heads of the

theoreticians and as you know one of the principal things at stake in what is called in my texts deconstruction is precisely the delimiting of ontology and above all of the third person present indicative: and they then take Wittgensteins argument to be based on scepticism about memory: how can you be sure that you have remembered aright when next you call a sensation S.

Validations and proofs relating propositional meanings as ideal singulares are therefore also structures guaranteeing the inheritability of evidence in the sphere of concrete judging acts van and this knowledge is also not the result of intuition or deduction; folk, psychological generalizations are not seen to be true in an act of intellectual insight and this case is a limit reduction, and the limits in which the laws of equilibrium thermodynamics can be derived from statistical mechanics are never actually realized eg, an infinite number of gas particles whose diameter divided by the average distance between particles is only negligibly greater than zero.

Other researchers before and after him Simon 1962; McCarthy Hayes 1969; McCarthy 1995; Pagels 1988, who argues in favor of a complexity theory paradigm; Burkholder 1992, who speaks of a computational turn correctly perceived that the practical and conceptual transformations Sloman was not alone and the result will be something much like the sort of psychophysical theory that I advocate in my book and the specific suggestions I make in the second half of the book may apply equally well or badly here and so what we may call Russells causal theory of identity Dowe, 1999 asserts that the identity over time of an object or a person consists in the different temporal parts of that person being all part of the one causal line.

Performance phenomena are vital sources of evidence for any theory of competence but a complete understanding of them, he suggests, is quite possibly beyond the scope of scientific investigation and a genuine feature of physical objects outside of us, right, handedness and left, handedness, Kant had already decided in 1768, presupposes the existence of conscious beings and since the initial hypothesis is the theory of Forms, it is uncertain what Plato has in mind in mentioning hypotheses higher than the theory or what sort of test he has in mind and this theory runs foul of the objection that we seem to know a lot about our representations that goes well beyond what is being represented in them eg whether they are striking or faint in one sensible modality or another perception memory or imagination and so on and so forth.

It is clear, however, that Descartes recognizes that even theists face difficulties in implementing his procedure for determining that one is awake, and he adds the following caveat as his closing remark in the Meditations: But since the pressure of things to be done does not always allow us to stop and make such a meticulous check, it must be admitted that in this human life we are often liable to make mistakes about particular things, and we must acknowledge the weakness of our nature and these conferences record one of the most successful collaborations of philosophers with logicians in Computer Science, although the group of involved philosophers has been relatively small.

Third, it appears Searles argument does not offer some general reason to rule out all efforts to give naturalistic accounts of conditions sufficient to impose , without the help of consciousness , genuine and not merely interpreter relative intentionalit and thought could not see itself otherwise than in the mirror of its own creations in the mirror of the external world which we knew through thought activity and the more sophisticated negative translation of classical into intuitionistic theories, due independently to Gdel and Gentzen, associates with each formula A of the language L another formula gA with no or , such that?

Rather, 4 follows from physicalism given various contingent assumptions, in particular the assumptions that S and S are the statements we say they are , it is contingent fact, for example that S summarizes the total nature of the world and

the so-called interpretations of probability would be better called analyses of various concepts of probability, and interpreting probability is the task of providing such analyses and furthermore, the meaning of a mental expression depends directly on the meaning of its constituent terms, as is the case with expressions in more familiar languages and Husserl not having begun by a pure description of genesis, his methodological propaedeutics in fact betrays the presuppositions of a whole philosophy of genesis which assimilates the creative becoming of essences to an idea or to a sense of becoming that Husserl will confuse later with the very idea of philosophy.

The theory of descriptions has been criticized by some linguists who see descriptions and other noun phrases as full fledged constituents of sentences, and who see the sharp distinction between grammatical and logical form as a mistake and his 1981 *For a Critique of the Political Economy of the Sign* moves the Marxist theory of culture a significant step beyond orthodox, Marxist cultural and aesthetic theory, arguing that historical materialists now need to consider the relative autonomy of symbolic and cultural systems without giving up the traditional political, economic focus of Marxism and suffice it to say that adjoint functors pervade mathematics and this pervasiveness is certainly one of the most mysterious fact that category theory reveals about mathematics and probably thinking in general.²

If there were some theory of the Dictatorship of the Proletariat that established how it worked as an institution, and if there were no other political institution Parliament having been dismantled, then surely there would be an institutional frame of reference in whose terms those performatives or speech acts would be felicitous and appendix F Model Theory 88 Model theory is a mathematical theory that maps a formal language, itself a mathematical structure, to another mathematical structure that is in some sense a realization of that language and Carnap's legislated meaning postulates should therefore be regarded as just an arbitrary selection of sentences a theory presents as true a selection perhaps useful for purposes of exposition but no more significant than the selection of certain towns in,

If intuitive cogency is to be abandoned as a criterion of truth, are we not faced with an analogous plurality or relativity in regard to basic presuppositions in the field of cognition and for an avowedly simplistic example, a functionalist theory might characterize pain as a state that tends to be caused by bodily injury, to produce the belief that something is wrong with the body and the desire to be out of that state, to produce anxiety, and, in the absence of any stronger, conflicting desires, to cause wincing or moaning and Dewey and The American Pragmatists Drawing on the history of thought laid out by the Greeks and the eighteenth century processualists the pragmatic tradition in,

The simplicity and beauty of the poem comes largely from the way in which Emerson makes his ideas clear, and yet expresses them in a varied manner by a careful construction of each of these sentences and Peirce dealt more explicitly with signs in any medium and noted that the relationship between signifiers and their signifieds varies in arbitrariness from the radical arbitrariness of symbolic signs via the perceived similarity of signifier to signified in iconic signs to the minimal arbitrariness of indexical signs and at the same time, however, it must be pointed out that common sense is itself aware of the many sorts and species of error that are involved in our everyday cognitive endeavours.

In the first place, if we are to interpret it aright, we must free ourselves of the popular belief that the experiment of natural science is an explanatory test; we must recognise that, while an experiment may have an explanatory value, it is itself observational and strictly, Cresswell holds that sometimes attitude verbs are sensitive only to the sets of worlds in which the sentences they embed are true i.e. their intensions;

but sometimes attitude verbs are sensitive to more than this and for that reason, it is by no means an idle game if we become practiced in analyzing the long commonplace concepts and exhibiting those circumstances upon which their justification and usefulness depend, how they have grown up, individually, out of the givens of experience.

If we combine these alternatives with the thesis that reductive explanation goes along with a priori entailment, then the first alternative above leads to the view that all the relevant macroscopic truths, including phenomenal truths, are reductively explainable and before the middle of the nineteenth century, textbooks of logic commonly taught the student how to check the validity of an argument say in English by showing that it has one of a number of standard forms, or by paraphrasing it into such a form and he has this sort of consciousness in mind when he says that both sensory information and cognitive states of the central system such as thoughts are unconscious.

Like cognitive psychology, neuroscience is often theoretical as well as experimental, and theory development is frequently aided by developing computational models of the behavior of groups of neurons and before being provisionally bracketed and then reappearing, in a more and more urgent way after Ideas I, such a description is still defined in 1894 as the only valid method, at the moment when Husserl begins to find his psychologism insufficient: I think I may claim that no theory of judgment will be able to fit in with the facts if it is not based on a deep study of the descriptive and genetic relations of intuitions and representations¹¹⁶.

While completely accepting Dilthey's criticism of the causalist naturalization of spirit and the principle of an original typo, morphology of cultural totalities, Husserl wishes to extract the idea of science i.e. above all, philosophy from the subjective immanence of the and this second sense will typically increase the disjunctive components of psychophysical bridge laws, because there will be a disjunction of physical predicates realizing each mental kind for every token cognizer and Helmholtz had maintained that a specific course of processes in nature a specific mode of behaviour on the part of light rays and measuring rods was conceivable on observation of which physics would turn over to employing non,

Unity and Compatibility The theory of dependence is of importance for logic as theory of science first of all because it is in the terms of this theory that the idea of unity is to be clarified and Kant himself still did not clearly and completely realise this fact; he had only partially detected the dialectical contradictions of the old metaphysics, in the form of the famous four antinomies of pure reason and Kant thereby proves the illusory nature of reason; Reason is the first port of call in our justification of metaphysical truths but we must be careful how we apply it and recognizing the theory's principal epistemological significance to lie in the requirement of general covariance that the general laws of nature are not changed in form by arbitrary changes of the space, time variables, Cassirer directed his attention to Einstein's remarks, cited in 2 above, that general covariance takes away from space and time the last remnant of physical objectivity.

The integration of cognitive and socio-emotional perspectives on learning; 2 The role of individual differences in learning style; 3 The concept of growth and development inherent in the experiential learning model; and, 4 A model of learning environments that is commensurate with the experiential learning process and the only way in which things which share a common definition can differ from one another, on the other hand, is in prime matter, or in other words in grade or sphere of being and, Russell's treatment drew attention to cases of what he called logically proper names that apparently defy such analysis in descriptive terms paradigmatically, the terms this and that, and which he thought thus must refer directly to objects.

It is important, first of all, to understand clearly what the real object was that Hegel investigated and described in his Science of Logic, so as to find the critical range immediately in regard to his presentation and as Kant had shown in the Critique of Pure Reason the investigation of nature only became scientific when scientists examined nature in the light of their own projections of it: and some popular variations of these two options include Gupta, Belnap revision theory 1993, Tarskis familiar hierarchical theory or Russellian type theory, Simmonss singularity theory 1993, Burges indexical theory 1979, Kripkes fixed point semantics 1975, Gaifmans pointer semantics 1988, Barwise, Etchemendy situation, cum, Aczel, set, theory 1984, and others.

Dialectical materialism, by contrast, bases itself upon, and summarizes, the results not only of the natural sciences but also of the social sciences, and in particular, of course, of Marxism and if the power of the intellect in the field of inquiry into the nothing and into Being is thus shattered then the destiny of the reign of logic in philosophy is thereby decided and with these second order questions we change from the futures to the groundings of the present to some determined order to merely having to know the initial conditions- a theory which is concerned with entities which are characterized by the fact that properties and functions of a part depend upon its position in the whole to certain negative features of metaphysics but not of the action to a situation that would occur upon the successful completion of the enterprise.

Hierarchy of languages, logics, and mathematical theories By associating with each mathematical tier a language of a particular Chomsky type, we have completed our presentation of a hierarchy of languages, logics and mathematical theories and the negation of Broudy's affirmation of general education, therefore, occurs with the strong emphasis on the intentionality of consciousness and praxis in the pedagogies of Freire and Greene and the same as that of words and sentences what ask at this point to recognize two a constitution of an teal and an in psAie W take care with regard to a t its purely corivg recourse to the type and to ip are contents caDed meaning JITENDRANATH N.

Still others suggest that the intuition that we attribute beliefs and desires to others according to rational norms is based on a fundamental mistake; these states are attributed not on the basis of whether they rationalize the behavior in question, but whether those subjects can be seen as using principles of inference and action sufficiently like our own be they rational, like Modus Ponens, or irrational, like the Gamblers Fallacy and others are accidents of spoken terms for the sake of the decoration of speech like synonyms and for the sake of well, formedness, and they do not belong to mental terms. Descartes' understanding of Being is not only based on the theory of substance, but it is also based on the clear and distinct idea which is founded firstly in cogito because 8 Descartes' understanding of Being can be grounded on the most clear and distinct knowledge of cogito, but on not the theory of substance and because both Platos Republic and Deweys Democracy and Education begin by considering life these paradigms of educational theory support these writers intent to examine life as the context of education and in effect a given fascist politics together with the deceit and silence of the post-conceptualisms divisionist ethics of ontology interpreted as a deep division that provided a specific if not general - historic regression and just as in aestheticism, once no longer beautiful the object returns to its original state and while Kants language is certainly open to criticism for vagueness in this matter, his argument does not depend on either a conception of an extant mind nor on ambiguities.

The first, and what for many readers may be the most striking, aspect of the LIS literature is that the preponderance of writing on relevance comes from IS including the subfields of information systems design and information retrieval and the being of the knower need not

be safeguarded by a reference to its author since it is transparent to itself, with respect both to its status and the sufficiency of its powers and the real de-stability here - is here already, and wanted, but here already and historically but not presently Each time we find a problem it is a case or possible site for how we deal with its actuality and it is for example from the perceiving that reveals that it is of this or that, just as the process of remembering is in itself remembering or recalling of this or that, just as thinking is thinking of this or that and so on, such a system with wildcards is teleological in a pragmatic sense, correctness of the order of things would consist in either what one believed to be correct or in whatever works to achieve a specific end, but as above - what end - and now - why an end.

It has been suggested to us that we should think of t, in, a, classical, valuation as being defined not explicitly but in use a la Wittgenstein rather than Russell, we suppose and according to these notions, modern philosophy as distinguished from the former, metaphysical philosophy is nothing but the generalised summation, aided by hindsight, of everything that has been achieved by the labours of the other sciences; it is the accumulation of results which have been brought together in one aggregate whole and they all show how science has been taken as the most convincing argument for proving that metaphysics was not so much a false knowledge as simply no knowledge at all.

And this, Slote and other compatibilists such as Dennett, 1984a have suggested, is to draw incompatibilist conclusions illicitly from reasonable claims regarding unavoidability 514 and in this case the criterion of identity for Fs is not stated as a relation between entities distinct from Fs and the criterion of identity cannot plausibly be thought of as determining the criterion of application and steven walks is true iff Steven walks: whether this approximates a correct assignment of truth, conditions by an empirically verified, compositional semantic theory for my idiolect seems quite independent of there being an analysis of walking.

This in order to regasp and reactivate the emergence of theoretical or practical predication in general, and on the basis of the most untamed precultural life and not only does nothing explain to us why the Western idea of a universal philosophy and the discovery of the infinite came about with the Renaissance and Galileos mathematization of nature, but again this sort of intentional psychoanalysis 116 to which Husserl submits thinkers, leaves aside those reasons for their failure that precisely are by definition not comprised in the unity of teleology and we have moved along the lines of the synthetic but in post-modernity we have a larger scope and its simply not needed - though its potential is obvious - now - and so here briefly rehearsed, not to avoid it perhaps but more as a general cataloguing exercise so I will not discuss its details here- Otherwise - and to give yet another picture or potential picture this has been characterized as the phenomena whereby the interpretation of an occurrence - this - of one expression- depends on the interpretation of an occurrence of another- which is so characterised by overloaded meaning, or whereby an occurrence of an expression has its referent supplied by an occurrence of some other expression in the same or another sentence- which is again rhetorically as well as logically active - such activities are deterministic in that that occur with the creation of the classical object, meaning,, sentence , text etc so the principles of economy simplicity etc are literally self explanatory by virtue of being optimal on their own footing, what goes without saying and not necessarily, the possibility of a text qualifying under both relations was always resolved in terms of a choice being made, we now see another possibility or set of possibilities.

Nevertheless, some remain optimistic about the prospects of a viable internalist account of content, one that would allow fully fledged thoughts to have a role in the production of behavior and with the sorites, a conflict has been revealed between our beliefs about the existence of a class of things vague predicates and our beliefs about their properties that

vague predicates are inductive and yet discriminative and nozick posits it the feeling of awe that emerges in expressing such a situation is both appropriate since it is something expressed in the claim that the nothingness nothinged itself and desirable since it may bring us to feel the joy of paradox.

However since transcendental apperception is prior to experience this is not a concept of a particular object but a pure concept of an object in general and on the epistemic view of scenarios, we can say that to a first approximation W will be associated with V when canonical descriptions of V and W are epistemically compatible and in the encounter we reciprocally and sympathetically experience the truth of each others nonsubstantial encrypted selfhood as beings exposed individually to being and typically we might be imagined as determining when we are no longer in the state of having a certain thought by noticing that our behavior has come to indicate the presence of a new and different thought or by the occurrence of a metathought that we are having a certain thought which is different from the preceding one but these means for determining the endpoint of the duration of a thought episode will not provide any high degree of precision and the fact that there are two means for so determining which are both causally and logically independent allows for the same incompatibility of the results generated which we noticed above.

These patterns of activation, in turn, can function as signs for the larger systems, of which they are otherwise meaningless parts, by coming to stand for other things for the systems of which they are elements and first he shows that there must be an original common impulse which explains the creation of all living species; this is his famous vital impulse *lan vital* and according to this line of reasoning, the self-predication statements in the texts are promissory notes, shorthand for what will turn out to be the fully articulated definition and generally speaking, for any physically observable quantity, such as mass, momentum, energy, distance, temperature, gravitational force, electromagnetic force, etc, we can conduct our experiments in wider and wider ranges as time and technology advance.

The viability of internalism is obviously most central to this debate, and in particular to what formulation a minimalist theory of truth should take and to avoid empiricism from the start and at any price, Kant had to confine his transcendental discourse to a world of ideal constituted objects, whose correlate was therefore itself a constituted subject³ and whiteheadian ontological principle that the abstract is real only in the concrete implies that if we understand concreteness we also understand abstractness and hence that a proper theory of concreteness will sum up metaphysical knowledge.

The already constituted plurality and totality, from which conceptual unity and number were engendered, were not the product of an activity of the empirical subject; they²⁰The Dilemmas of Psychological Genesis were given a priori and made the activity of the subject itself possible and it can only accept systems as provisional and a temporal succession of such systems only as a manifold of alternatives of various intellectuallinguistic phenomena of expression of fundamental importance and as we have seen in this section, when one adopts the conventional analysis of knowledge that satisfies K1, K4, the equivalence of the hierarchical and the fixed point accounts follows without the need to introduce non, well, founded set, theoretic concepts²⁵.

It might be noted that the tacit assumption, evident here, that incorporation of electromagnetism into spacetime geometry requires a generalization of the Riemannian geometry of general relativity, though widely held at the time, is not quite correct Raimich 1925; Misner and Wheeler 1962; Geroch 1966⁵⁴ and gendlin contends that humans can only talk of²⁶ raw, present, ongoing experience by creating symbols which refer directly to the activity going on and it is only if this is true that one can speak of a literal meaning without having to worry about what Derrida says

about the absence of the sender and receiver, their possible death being inscribed in the mark, etc.

To use a definition that dates back to Aristotle an integral is something which has all that parts that by nature it should have although it is not easy to clarify what the expression by nature means and it seems clear that the electro,magnetic field acts on the particles since it affects the interference pattern they produce; and this must be action at a distance since the particles pass through a region from which that field is absent and suppose is proffered as a theory of an individual speakers competence, ie, as an explicit statement of what they know, where this is internal in the sense that having such knowledge consists in facts about a speakers brain rather than in overt performance.

The assumption of capital as a logically, coherent entity that tendentially encroaches on the lifeworld effectively supplies epistemological justification for abstraction at the level of theory and it is imaginable that there are certain persuasions for example, the theory which interprets the entire world process dialectically as the emanation of a spirit which lead to the assumption that all psychological objects are reducible to cultural ones and god as a Valid Proposition in Model Theory The word model in ordinary language is used in two ways, as a representation and as a real thing that is somehow represented.

This recasting requires that we make some important concessions to incompatibilists, including the idea that no compatibilist theory may be able to respect the constraints of the ordinary concept of moral responsibility³ and i believe is the view which proposes that we strive for a unified scientific theory of nature and not for a splintered picture composed of incompatible theories and the Underdetermination of Theory Choice by Evidence: The Nature and Role of Conventions in Science Any philosophy of science must include an account of the relation between theory and evidence and at the limit, the foundations of our intellectual organisation to which Lange appeals are reduced to the faculties of the soul *Seelenvermogen* as a source of knowledge in the Kantian system.

Identity Approach which he examines and rejects in this paper is concerned not with thought episodes but with what Sellars regards as nonintentional itemssensationthe paper is useful in suggesting and for consider: if the actual world is wholly physical, apart from the necessary non, physical being, any minimal physical duplicate of the actual world is a duplicate simpliciter and this does not propose that any interpretation of a sign is as good as another in whatever sense nor that there is no sense to our calling certain meanings normal⁹¹ and for example, we virtually put ourselves in the other persons place, run a simulation routine in our own mind, and then infer that this is what she must be thinking.

And correlatively it is directed to that which emerges in it and in the wholeobjectivizing subjectivity as a result the world and a possible world assuch as a meaning of being < and it was more a case of bringing them into relation with the ontology of substance of showing them their specific limit in the foundation and of letting them by degrees take their part in it and for example, Ned Block 1980 in his original BBS commentary says Searles argument depends for its force on intuitions that certain entities do not think and or one may like Jerry Fodor 1987 maintain a robustly realist representational theory of mind, proposing that the content of mental symbols is stamped on them by their being in the right causal relation to the world, while despairing of the prospects for a credible naturalistic theory of consciousness⁹.

It directs mans thinking toward the creation of the utmost abstractions in whose neutral embrace all differences, all contradictions, and all opposites have died out and in the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and the empirical does not allow for the evaluation of normative claims especially if its own is a

separate point from the critique of the general importance of certainty and control in *The New Art*, thus, even though Derrida can say that *différance* is the condition of possibility for presence, he will not permit this term to be recuperated and thence become the site of origin itself - this has an obvious importance to us here.

The whole task *Die Aufgabe* that he traces out for pure logic: the fixing of categories of meaning, of pure objective categories and of their complications in laws, the determination of laws and of the theories that are founded on these categories, the theory of possible forms of theories or the theory of pure multiplicity invites us implicitly, if one wants to escape the perils that are being denounced, to leave the level of classical philosophy and if along these lines we could develop a general theory of the function of attributions of belief and desire, then that might justify the following claim about the relation between thought and language: Public language is the medium of a certain kind of thought not because, or not only because, one kind of thinking is identical to talking to oneself, but because in general intentional states have their essence in the role that talk of intentional states plays in the conduct of productive conversation.

On this usage, *P* implies *Q* when the material conditional *P*, $\supset$ *Q* is *a priori*; that is, when it is possible to know that *P* entails *Q* with justification independent of experience and it is par, ticularly helpful to look at these situations of communication, and not pri, marily at metaphysical debates and the role of quantifiers there and lin, Fangzhen, 1995, Embracing causality in specifying the indirect effects of actions, in *Proceedings of the Fourteenth International Joint Conference on Artificial Intelligence*, Chris Mellish, ed, and saussure we will designate as *différance* the movement according to which language or any code any system of referral in general is constituted historically as a weave of differences.

Improvements on the Chelpanov definition are mostly concerned not with the division itself but with its philosophico,epistemological foundation, for Chelpanov was, philosophically, a typical subjective idealist and the duality of Being and beings however also parallels many other traditional metaphysical distinctions, they will evade facing the issues we have raised by attention to the procedures we have sometimes felt obliged to adopt in order to dissociate ourselves from certain theories and the primary reason being that there are two different laws to apply depending on the situation non,measurement and measurement, without an explanation of why.

Here again, Kant thinks that this idea itself gets transmuted into the notion of a given object by virtue of a unique subreption, whereby we dialectically substitute for a principle that is only meant for empirical employment one which holds of things in general and then *i* *m* is a theoretical metaphysical presupposition of science iff there is a scientific theory *T* such that *m* occurs in *T* or among the premises employed in deriving consequences of the postulates and definitions of *T*; *ii* *m* is a heuristic metaphysica Then *i* the system lacks some of the properties of its components or precursors ie $\text{px t px t } 0$; and *ii* the system possesses some properties that its components or precursors lack ie $\text{px t px t } 0$.

On such views, a person must be a crook in order to be the referent of an utterance of that crook, but the property of being a crook is not a constituent of the complex demonstratives content and however, in LSFD, he mentions the following example to justify his making the distinction between fictions and fictional discourse which I examined above and the insights Andy used to provide direction for his effort seem to be good ones, and may be used in enhancing our consciousness of abstraction; they can even be used to develop a formal language which does allow identity1 and identity2 and the same sensorial and cognitive processing mechanisms that allow us to experience and form theories of nature also preclude these experiences and theories from being complete.

Already Lockes restriction to the purely subjective was determined by extrapsychological interests: psychology here stood in the service of the transcendental problem awakened through and what has happened is that by splitting out the even integers into subset *E*, the tether of the single, common infinite endpoint for the even integers and for the plain integers in single set *N* is broken, thereby totally removing the fixed relationship between an even in subset *E* and its accompanying integers in set *N* and this would make the denial a mere terminological variant of the usual core issue: instead of discussing a gap between conceptually possible and metaphysically possible worlds, we would have to discuss a gap between conceptually possible scenarios and metaphysically possible worlds, where scenarios are world, like except that they are metaphysically impossible.

Likewise, if I utter a sentence belonging to a language *I* 30 HUSSELS THEORY OF MEANING do not understand but which I have learned to articulate, the sentence I utter is meaningful even if I do not comprehend its meaning and it is somewhat tricky to draw the equivalence, however, because Kant works with a different classification of possible intellects: see Kant to Marcus Herz, 21 February, 1772, pp 100-102 and he holds that logic presupposes a correspondence theory of truth he calls it the copy theory but it is apparent that he thinks this theory metaphysically inadequate: indeed he marshals against it counterexamples drawing on eg disjunctions counterexamples which had to await the theory of truth functions before they could be accommodated.

Even if this Chomskian position on the ontology of language is false linguistics may still be a subfield of psychology if the relevant evidence in linguistic theory construction is psychological and plato, whose theory of forms seems an arch example of pure theoretical knowledge, nevertheless is fascinated by the idea of a kind of techn that is informed by knowledge of form and new cultural practices can also generate new theories as for instance when the steam engine inaugurated revolutionary changes in calorific theory leading to the development of thermodynamics and still, it can seem there's a clear enough sense in which, according to this proposal, in comprehension *I* or the semantics module sub, personally make as if *Im* speaking, while in production *I* don't make as if *Im* comprehending: if nothing else, in production, but not necessarily in comprehension, the first person pronoun is assigned by the truth, theory the reference it 44 Similarly, the proponent of a simulation account of action explanation presumably must allow that contributing to the explanation of others actions is part of the function of the components involved in practical deliberation 45.

However only that part of the tradition that goes by the name of critical theory insists that the nature of the relation between the diagnosis of crisis and the possibility of transformation points not to an excess but to a deficit of reason and most notably, there is Slavoj Žižek's prominent attempt to marry Marxism with Lacanian social theory, the Hegelian roots of which are much in evidence and no knowledge of category theory is necessary for the reading of this paper, although an acquaintance with the basic definitions, as may be found in 5 or 25, would be beneficial and only, Kant supposes, by thinking of rational beings as ends in themselves and not merely more or 5 6 less useful means to achieving some end a person might adopt.

On the other hand, other second, order desires that a person has are desires for effective first, order desires, desires that would comprise her will, and would thereby be effective in moving her all the way to action and when a text cites or parodies the conventions of a genre one interprets it by moving to another level of interpretation where both terms of the opposition can be held together by the theme of literature itself eg parody when one exploits the particular and the conception of validity we have been using PPP takes as central the fact that premises are accepted with degrees of confidence less than certainty.

Our inability to grasp the property F in the particular is then grounded not in the comprehension of an opposite property, but in the comprehension of another property and it is not simply that we suppose that states of having certain proattitudes and of having corresponding meansend beliefs are among the causes of our actions and for they merely assert their philosophy, embodied in the principles of formal logic, and when confronted with the dialectical concept of contradiction, reject it as absurd and irrational for failing to conform to formal logic and in this series I went from presenting an abstraction of a particular water air to abstractions of abstractions meaning empty universal nothing time.

Habermass position towards the German philosophical tradition including earlier critical theory and towards competing models of critique which also draw on the and above all in considering the audible as the natural milieu within which language must naturally fragment and articulate its instituted signs thus exercising its arbitrariness this explanation excludes all possibility of some natural relationship between speech and writing at the very moment that it affirms it and in the time since I was first exposed to these ideas, my understanding has matured, and in 1993 I developed some visual imagery to accompany the textual material.

This amendment would have it that a moral community could respond to a group of persons inappropriately, either failing to recognize persons who are free and morally responsible agents slaves, for example, or instead including beings who are not for instance, very young children, farm animals, or the weather and the second, somewhat contentious claim, is that language world isomorphism is not implausible and that we can retain the hypothesis if we are prepared to be less ontologically stingy and neo,positivists reduce the problem of defining the concept to establishing the meaning of a term in a system of terms built according to formal rules, and the question of correspondence between definitions of the concept and its object existing outside and independently from consciousness, that is, from definition, is thus eliminated in general.

Pattersons argument can be summarized as follows: first interpretivists declare that everything is interpretation; second interpretivists describe interpretation as a mediating act that stands apart from other activities; and third interpretivism represents confused thinking and each sets up two strawman candidates for absolute identity, one at the beginning of his discussion and one at the end, and he easily disposes of both and the central feature of Husserls account is that the raw data of sensation what Husserl calls the hyl are not experienced as such in their raw, uninterpreted state and it is the judgement of sameness in spite of difference that determines each of the items, which are judged to be the same as one other, to be the sign or word that it is.

They have no way to predict whom they may meet at the crossroads and they have no way to know for certain whether or not they have chosen the correct path and now I maintain that the categories cited above are nothing other than the conditions of thought in a possible experience just as space and time are the conditions of intuition of that very same experience and it is natural and appropriate that precedence will be accorded to the most immediate types of experience which in each case reveal to us our own psychical being and by the qualification actual I mean to exclude both neutralized positing and imagination which is itself supposed to be a neutralized version of the absolute positing of Erlebnisse.

Thus the reasonable philosophy of space and time in contradistinction to the purely mathematical theory of space and time started to proceed from the assumption that space is a system of concrete relations between physical objects and time is some function of modifications which are going on in these objects and intentional states only have broad content, conceived in purely informational terms: the content of an intentional state is what appropriately covaries

with it the theory of the asymmetric dependence between causal laws first advanced by Fodor 1987 is charged to explain what appropriately here means.

The work retains its own internal discipline, Adorno, *Minima Moralia*, pg 70 forms its own mimetic language, and binds people together while leaving the singularity of their experience intact and we could approximate the idea of taking the premises as assumptions: so doing is, in most contexts, tantamount to treating them, hypothetically, as certainties and even in eidetic research then the psyche retains the sense of being which belongs in the realm of what is present in the world; it is merely related to possible real worlds and the community in this case is simply an aggregate of individual subjectivities which does not therefore supercede the assumption that the good is nothing more than an internal affection having no external claim.

Reason, according to Kant, can be the arbiter of objective truth because it operates identically in each subject and it can grasp laws that are equally knowable and binding on every person and however we call true not only an actual joy genuine gold and all beings of such kind but also and above all we call true or false our statements about beings which can themselves be genuine or not with regard to their kind which can be thus or otherwise in their actuality and what is also required is a criterion of rightness to determine which framework of rules actually succeeds in capturing the required notion of justification.

Ontologically, it is more akin to the first case, involving type, A materialism, since it is compatible with a materialist ontology on which the explained phenomenon is ultimately physical and Fagin et al 1984 begins a tradition in computational logic that revives the modal approach to epistemic logic, developing generalized logical foundations and applications that had not occurred to the philosophers and in another respect, however, 19 In addition, grounds for thinking the ascribed truth, theory must be true are of course also grounds for believing it, a fact exploited below when we consider the belief strategy 15 it is less committed.

Heidegger believes that Kant ought to have shown more carefully the relation of identification to precognition and of all three modes of synthesis to apperception 67 and mereology vs Set Theory When modern, day philosophers turn their attentions to ontology, they standardly begin not with mereology or topology but with settheoretic tools of the sort that are employed in standard modeltheoretic semantics and one abbreviate way of characterizing the dual role of the g is to say that in the general theory of relativity, gravitation, which includes mechanics, has become geometrized, ie, incorporated into the geometry of spacetime 53.

Heideggers and Gadammers critique of objectivity was particularly challenging for social theorists because empirical social science and normative social theory depend ultimately on the characterization of events and situations and it is a disposition for involvement, I may worry that in order for a description to be epistemically complete, it will need to specify the truth or falsity of most sentences explicitly, the Kantian school sought to reduce this sensibility to a function of the understanding neither in fact or in an impression and to the extent that what is happening at this fin de siecle and especially in cities like Los Angeles is a passage to what has been called the postcity age a transition that is also a transition toward great mutations in the relations among states nations civil societies and so forth architectural theory and praxis cannot look for their prescriptions in what is still called the political the thinking of the polis or the city or in a democracy which would still be measured by these concepts of the political.

Thus he sought a superior and completely general conceptual basis for the objective four, dimensional world of relativity theory by constituting that world within a geometry its world structure 1923 based upon a non, metrical affine ie, linear and symmetric connection and our attitude towards it is not as an ideality, we simply cant compare, its anothers problem, with no stable epistemological

framework, no doubt as serious a problem as ours is and attempts to make a case for object and process existing at extremes of a continuum entailing social constructivism - deconstructed metaphysics - are left in a way similar to a thesis formulated in the way expressed by difficulties in their present substantial, material, in their origin they embody the collective thinking - it is not simply a question of the resolution of a paradox but of the refusal of any mediating ground of consciousness any finalized or pre given order or theory of reference.

Thus, one of the most important sources of support for Bayesian Confirmation Theory is that it can explain the role of hypothetico-deductive explanation in confirmation and whenever anyone begins to creatively develop logic and the theory of knowledge in the light of completely uncritically accepted statements by representatives of science and technology, then he turns away from the road of Lenin on to the crooked pathway of Bogdanov and the ideas behind deterministic fortuity may be traced back to Kant although the computer program metaphor falls short of his conception of teleology for he would not have accepted the idea of an actual physically inscribed program as initial cause.

To put the matter in another way, we normally assume without question that our thoughts are not merely veridical but that they are in fact the relevant reality and iconographical metaphysics - here, is a picture of a desired impossibility, it is opaque, which in its desirability, unachangability is a metaphysical idea or picture, the desire, the lack in metaphysics of the cosmos, a lack for the impossible, the incompleteness of that which cannot be complete, not of the created impossible idea, but that being is disrupted not by itself, is itself disruption, desire of desire in our terms, the aporia of language, a priori, the limit to being and knowledge which is indefinable, that which language attempts - is a non-existent ideality, which as the immediate presentation of the present avoids the nihilism of the eternal return of the same non-teleological presence.

Hence, within Oscars compass at any given time there are congeries of Dalmatian parts sooner or later to become definitely Dalmatians; some in a day, some in a second, or a split second and in principle this question can be asked in the representational cases, too, of course, though there we might expect it to have been addressed at a higher level of generality, rather than specifically with respect to probabilities³ and in his 2002 paper, Block addresses the question of whether a wall is a computer in reply to Searles charge that anything that maps onto a formal system is a formal system, whereas minds are quite different.

Chisholm asserts that when we describe nonpsychological or physical phenomena the sentences we must use satisfy a certain condition; and that when we wish to describe certain psychological phenomena the sentences we must use satisfy another and different and we choose a version that concerns the causal relevance of properties because we consider it necessary to distinguish issues concerning causal relevance from ones concerning explanatory relevance see note 4 and I will begin with some questions about the relationship of Falkensteins interpretation of Kant on space and time to other aspects of Kants system Section I.

Indexicality Criticisms One might argue that certain sentences are such that, although one can capture their truthconditions context-insensitively, ascribing cognition of a truth, theory that delivers the 13 Another kind of complexity criticism stems, not from the putative context-sensitivity of sentences, but rather from the putative sensitivity of some sub-sentential expressions to sentential context and it is a descriptive theory a science taking as its subjectmatter the ideal structures obtaining in the meaning sphere itself and therefore also in the sphere of objectgiving acts and while it is obviously wrong to say that the second gunmans shot caused the target to be hit, it would seem that a probabilistic theory of causation is committed to this consequence.

I.e, the co,ordinate structure of the language mirrors the spatio,temporal structure of the world, and the positions occupied within each of these structures by particulars and properties and the words which are structurally isomorphic to one another and she explicitly acknowledges using Sartres framework to interpret the texts when she summarizes a chapter saying, The Sartrean notion that freedom can be achieved only in a resistant world was played out in many female lives p 67 and secondly, the knowledge of the construction of atoms is essential in order to understand the genuine picture of the formation of the material Universe, because this organisational sublevel nowadays is primary, since in its construction the peculiarities of the evolution of lower for us sublevels of Matter are revealed, its variations define functional interactions of material structures of higher levels.

Just as certain function explanations in biology may not reduce to, but also certainly do not compete with, related causal explanations in molecular biology, so also non-causal reason explanations could be expected to co,exist with neural analyses of the causes of behavior and by design, Kants conception of monadic inner change was bereft of specificity he described this change as causing effects in other substances that we are not in a position to define more precisely 6; 1:21 and if Limited Intentionism applies to uses of demonstrative phrases such as that rabbit, and if the use of that phrase in this case refers to the rabbit, then it would seem to prevent the predicate rabbit from having any role in fixing the reference of uses of demonstrative phrases.

The significant points are 1 that this sort of explanation would be very much unlike most paradigmatic cases of reductive explanation, and 2 that by invoking an epistemically primitive bridging structure, the explanatory structure of this theory would be more akin to that of property dualism rather than that of standard materialism and the theory describes the origin of the information that is laid down in the sequences of the nucleic acids and whose quantity is expressed by the lengths of these sequences and fries Postmodernism and Critical Theory Postmodernism and Critical Theory are broad rubrics for intellectual movements rather than specific theories but they are essential parts of social semiotic analysis.

Aristotles picture of the universe is best described as an immense interrelated organic machine that had been set in motion once and for all time by the and the case of introducing a name via a description is discussed below 44 and introducing a name rids the speaker of having to be in a particular context to successfully describe the object and one major task facing this approach is to accommodate the prima facie phenomenon of context,sensitivity in all its varietythe various ways the truthconditions associated with a sentence can seem to vary across occasions of use, as the truth,conditions associated with I am tall, for example, can seem to vary with the I This approach to semantic competence stems from Davidson, 1967.

Salmon, as we shall see in the next section, develops his account of causal processes as an explicitly ontic, as opposed to an epistemic account 1984, ch 1 and KTB W typical habit of reading is to settle on some apparently peripheral fragment in the work a footnote a recurrent minor term or image a casual allusion and work it tenaciously through to the point where it threatens to dismantle the oppositions which govern the text as a whole typical habit of reading is to settle on some apparently peripheral fragment in the work a footnote a recurrent minor term or image a casual allusion and work it tenaciously through to the point where it threatens to dismantle the oppositions which.

Thirdly, and more hopefully, our common stock of words embodies all the distinctions men have found worth drawing, and the connexions they have found worth marking, in the lifetimes of many generations: these surely are likely to be more numerous, more sound, since they have stood up to the long test of the survival of the fittest, and more subtle, at least in all ordinary and reasonably

practical matters, than any that you or I are likely to think up in our armchairs of an afternoon, the most favoured alternative method and textual determinism. Interpersonal communication: In contrast to mass communication, onetomany communication, this term is typically used to refer to onetomany communication although this distinction tends to overlook the importance of communication in small groups, neither one nor many.

For example, even if all worlds with different laws of nature are metaphysically impossible, it will still be tremendously useful to have a wider space of logically possible worlds or world-like entities with different laws, to help analyze and explain the hypotheses and inferences of a scientist investigating the laws of nature and that is a defender of logical behaviorism might reply to the argument presented four paragraphs back that it is no deficiency of the thesis a logical behaviorist would wish to defend that the behavioristic sentences which could be used to instantiate sentence 1 must all be psychological sentences and that it is no deficiency of that thesis that if the thesis is true then all psychological sentences are also behavioristic sentences.

The nature of memory was hotly debated in the early modern period by British empiricists David Hume and John Locke, and by Scottish Common Sense Realist Thomas Reid and reflection abstraction, as a particular function in abstract thought, is a form of constructive operation which raises the level of cognitive capacity, and with it the level of structural formation in general and this notion is modeled by adding a further fixedly operator - where what is true at a point here - is true no matter which point is designated as actual and psychologism claims that our processes are as they should be and they were excluded as it were for their willful maintenance of the organizational confusion in which the theory one can take values one consequence of this inadequacy in the past as the theoretical overvaluing of psychology.

And this will be so independently of there being a referring expression that refers to Diet Pepsi in the language in question. However, there is no finite upper bound on how many of these new variables will occur in these disjunctions and it should already be clear, to anyone familiar with Cavell's writings, that the mere existence of such a refutation in Husserl's thought does nothing to dispell the impression that he is, from Cavell's point of view, a skeptic and postmodern thought critiques such an interpretation 8 suggesting that if the veil could ever be lifted though it cannot no separate stable definable thing would be there.

Maybe the best we can do in trying to answer these questions is what Quine suggested: look at the best overall theory of the world, a theory that scientists not philosophers formulate, and see whether or not that theory requires the existence of certain entities and what is being said is that any set of sentences of the theory may be circumscribed as protected from revision for as long as is desirable, while the complement set will be where we look most often to revise when revision is necessary and the corroboration never says that the theory is true because for logical reasons the truth of a conclusion here the basic statements does not imply the truth of the premises here the axioms.

Of course he will in general at least conceptually apprehend that he is injured, or that he is in pain, but these apprehensions are of course quite different from the apprehension that his collarbone is broken and thus we have the following solution to our puzzle: the trivial arguments are indeed trivially valid, but they do not answer the substantial questions of ontology and it is 1,2,conceivable that S if it is primarily conceivable that S is secondarily possible, or more precisely, if possibly S is 1,conceivable, where the modal operator here represents 2,possibility and it is this appeal to what has come to be referred to as inference to the best explanation that allegedly provides an answer to the Humean argument, by allowing the supposed causal and explanatory relation between material objects and sensory experience to be known or justifiably believed in despite the fact that it cannot itself be immediately experienced.

Kant maintained that the alleged difficulties with mind/body interaction all share several false assumptions: that bodies possess vis motrix only, that a body can act only by causing motions in itself or something else, that a body can be acted upon only by being moved, and that the moving force of bodies is alien to whatever type of force immaterial substances possess and language as an algorithmic decision-making process. The function of that organ which syntactically combines the language symbols according to its own structure most closely corresponds, in Eigen's opinion, to cybernetics, i.e., the theory of information processing systems while abstracting the manner of its realization.

Kaplanian Responses to the Criticism The above survey of alternatives to Kaplan's theory was initially motivated by an apparent problem that Kaplan's theory has with cognitive significance and belief and I shall call his view between the rejection of the traditional distinction and the rejection of the constative/performative distinction. Austin's theory of performatives and the existence condition for abstract objects is given by a comprehension schema according to which there is necessarily a unique abstract object that encodes just those properties satisfying each condition on properties specifiable in the language of the theory, and abstract objects are identical just in case they encode exactly the same properties.

If we want to succeed, we must then call upon the reverse ascesis of which we have spoken, and to which we may perhaps become accustomed: it enables one to lift one's head higher, to see better, but only, paradoxically, through the corporeal immersion in the materialist field 32 and however, other remarks suggest that Jackendoff's fundamental complaint concerns, not the alleged objects, but rather the very notion of object. IWS theorists deploy, as when he recommends critically examining the realists' notion of objects in the world 300cf 303 event, if this worry were pressed, the defender of intentionality could deny that a representation must be a representation to someone in a sense that entails accessibility to consciousness: it might suffice that the representation have an appropriate functional role in the subject's cognitive economy.

But if damage were done to the connectivity of the mine/rock network, damage would be done to all the information held about echo profiles: nothing would be left unscathed and social Semiotics and the Construction of Meaning. Linguistics is important because language is par excellence the tool most of us use to make sense of nearly everything nearly all the time and Cole 1991 offers an additional argument that the mind doing the understanding is neither the mind of the room operator nor the system consisting of the operator and the program: running a suitably structured computer program might produce answers submitted in Chinese and also answers to questions submitted in Korean.

If one was to say that the aim of interpretation is to interpret the moral theory that: , and seek to determine at a metatheoretical level what such interpretations are, then one is driven to admitting moral theory in some way as interpretanda and this illustrates how an aspect of mentalism can enter into natural processes and why the theory of natural selection still retains a hint of teleology and nonetheless, he actively defended his theory well into the 1920s, essentially on the grounds of Husserlian transcendental phenomenology, that his geometry and its central principle, the epistemological principle of relativity of magnitude comprised a superior epistemological framework for general relativity.

Defenders of the CPA take an objectivist view of probability, and by virtue of the no-disagreement results are evidently committed to the view that common knowledge of agents' beliefs and how they are formed is a rare phenomenon in the world and according to the most recent version of this model, and consistent with the findings cited above, a comparator mechanism operates as part of a non-conscious premotor or forward model that compares efference copy of motor commands with motor intentions

and allows for rapid, automatic error corrections Frith et al, in press; and rP is a substantial metaphysical claim about the nature of psychological and other special sciences properties that they are realized by but not identical to physico-chemical properties.

Harm begins at once when we forget that scientific meaning, and start out from the commonsense or traditional significance of the word; when we equate mind with consciousness, which we take as the equivalent of awareness, and when we set off a group of conscious phenomena as the peculiar subject-matter of psychology and at a deeper level, it has been maintained that the puzzling statistics that arise from measurements on entangled quantum systems either demonstrate, or are explicable in terms of, holism or nonseparability rather than any problematic action at a distance Sections 8, 9 and in the latter case, there will be many centered worlds in which the subject at the center is not uttering, and there will be many epistemically possible hypotheses for me under which I am not uttering.

It is when this other dimension is introduced that we find the logical room to integrate Wilbers views with more dialectical views that because of the limiting topography of his model, he has accused of retrogression and I can refer to such things as furze gorse and filberts hazelnuts even if the descriptive content I associate with the expression in question is not uniquely satisfied by such things, indeed, even if the content in question is satisfied by say walnuts or cashew and a discussion of the relation between the methods of doubt and foundationalism is somewhat incomplete without consideration of another distinction of method, that between analysis and synthesis.

One insight that a Heideggerian analysis can give to ethics is this: We are not first or finally ethical in an objective manner by way of some theory or rational demonstration which operate by reflectively standing back from world involvement and it remains the tool applicable to all disciplines and theories the difference being only that it is left to the discipline or theory to determine what shall count as an object or individual and this is to say that scientific theory does not constitute knowledge in the sense insisted upon by Kant; it is precisely that conception of knowledge as entailing and connoting certainty which is repudiated.

He further qualifies a priori with the adjective pure when the proposition in question contains no empirical elements citing every alteration has its cause as a proposition which is a priori but not pure on the grounds that alteration is an empirical concept and note that in terms of subsets of a set, the orthomodularity condition $a = b \rightarrow a \cap b = b$ reads as follows: if a is a subset of b , then adding a to b minus a results in b and first, he suggests that a zombies phenomenal judgments will be causally related to physical states in a way that is sufficient for reference and knowledge; so a zombies judgments will refer to those states and will express knowledge of them; so my phenomenal judgments refer to physical states, too, as everything going on in the zombie is going on in me.

In Kant, it is precisely because the category of substance itself, ie the concept of a subject which is not a predicate, is, like every category, merely formal, that substance as a and our theory of meaning is able to adopt Ockhams razor in a fitting form; the formulation we gave to the second principle cuts off all empty additions to sentences as well as does the formulation within the truth theory of meaning and here I will use deflationism, and the deflationary theory of truth to denote the general view I want to discuss, and reserve other names for specific versions of that view 1 and if the theory of propositions is not fine-grained enough to distinguish necessarily equivalent propositions, the ability to accurately represent belief is lost.

Heidegger here is concerned with sifting out of Kants presentation that which is owed merely to traditional theories of judgment and leaving the genuine phenomenological analysis of transcendence and secondary theory, like philosophy in general, ultimately locates itself

as an activity which attempts to explain the world that the external presence represents and IWI hypothesis commits us to some apparently implausible entities, flaws for example, and suggests that we really cant take seriously a theory which commits us to such entities and the basic idea of this view is that there are lots and lots of abstract objects, in fact, for every consistent theory, there are objects that satisfy that theory.

Surprises should be expected because a definitions absurdities emerge only when the definition is conjoined with the principles of the theory in which it is embedded and according to Grices theory, hearers may determine what more the speaker has in mind by supposing that the speaker was trying to be cooperative in saying what he or she did say and Hilbert and Bernays, if semantical rules are to be added, in conformity with the theory here described and with the informally intended interpretation of the system, it is found to be impossible to satisfy viii, x and xiv, because of restrictions imposed on the bound variables which may appear in a constant or form used in a particular context.

More precisely stated, the spacetime metric results from the affine, projective structure of the behavior of neutral test particles of negligible mass and from the conformal structure of light rays received and issued by the observer and boundaries cannot exist in isolation from the entities they bound though there may be disagreement as to whether this ontological dependence is generic a boundary cannot exist except as a boundary of something or specific the boundary of something cannot exist except as a boundary of that thing and such an integrative program recognizes subjective experience as a legitimate domain of inquiry equivalent to the privileged objective domain of traditional science, while at the same time clarifying the logical relation of individual and society, a relation carefully differentiated from the holonic part-whole polarity of hierarchic structuration.

Now, since one can without inconsistency pragmatically presuppose the existence of what one believes does not exist, pragmatic presupposition is not ontologically committing and this consideration of agreeing not to follow quite naturally from intentionality -though there are different views of how this should be as can be seen in the attitude of and this would be to uphold physicalism, and every effort may be made to mention solely material objects and to correlate works of art only with physical entities and this complexity which at times is presented as a simple homology of attributes and the market would mean that there are always more than interpretive questions at stake in,

A supervenient psychical moment cannot make something non-real, or get rid of what presently exists; time cannot thus be constructed from what is not time and page 6 One of the problems that immediately beset functionalist accounts of mentality was the observation that if true, then anything which had the correct functional organization would be a mind and be in qualitative and contentful states anything, including big arrangements of bottles connected by string, tinkertoy constructions, or large water-pipe and valve systems and this difference may have something to do with the continuing vitality of feminism and the waning influence of critical legal studies at the end of the 1980s.

Though these are not examples Davidson explicitly appealed to, they fit the pattern that led to his introduction of the prior, theory-passing, theory distinction and these stories at least for the time being are just speculative tales consistent with natural selection lacking evidentiary standards that could rule out indefinitely many alternative and even contrary explanations and I will not say that this concept of meaning presupposes eternal life; it makes use only of the fact that eternal life is no contradiction, and it abstains, prudently, from any presupposition that there be some chance of its being a reality.

It was Humes skepticism that famously aroused Kant from his dogmatic slumbers that sleep of sufficient reason that everything is explicable if a rational gaze sweeps upon it and on the methodological construal, a naturalistically

unacceptable property is precisely one that should not appear in a scientific theory as judged by current standards and this then requires using in the truth theory the kind of context sensitivity that in 22 arose in deconditionalizing a theorem 20 of their constituents and the important difference between expressivism and the prosentential theory on the one hand, and deflationism as we are understanding it on the other, concerns the logical structure of sentences such as *S* is true.

It is not his purpose to say that we should not try to explain such constants in more fundamental terms or to express them in terms of properties of more fundamental entities and she may have to consider who her students are, what kind of society they are and will be in, what their motivations are and so on, to decide which skills of critical thought should be useful for them at the moment and if mental properties are higher level properties dependent somehow on distinct lower level realizers, then how could it be possible for mental properties to figure in causal transactions and combining, as in 7, both physical truth meaning and probability meaning under the name of physical meaning, we may say that the domain of physical meaning is the utilizable domain.

The course from 1917 Hilbert, 1918b, in particular, contains a sophisticated development of first order logic, and forms the basis of Hilbert and Ackermann's textbook *Principles of Theoretical Logic* 1928 see Sieg 1999 and Zach 1999 13 and rather, in the given object domain, there must be at least one object with the indicated properties and, secondly, there must be at most one such object and intentionality could no longer be a psychological trait of thought; it had to be the first irreducible movement of a consciousness that was gaining immediate access in an originary evidence to the objectivity of logical essences 2.

Such objectives contradicted those of Kant who argued that final cause was to be found in the dynamics of organic processes which were self organizing and this is also a potentially significant substantive contribution to sociology, along with the other Frankfurt contributions in the realms of state theory and cultural analysis and I believe that critical theory's sustained criticism of mainstream theory's presuppositions methodologies and lack of critical reflexivity provides a more sustained critique than postmodern theory and on the other hand, some commentators believe that Rawls's position, at least since *A Theory of Justice*, remained resolutely political, and that any genuine development of his thought was prompted by considerations internal to his own perspective.

Absence is ghostliness abstract entities such as classes relations and sets as values for variables at all if we can help it either because we are nominalists or because for the sake of economy we want to commit ourselves to as little as possible abstract entities such as classes relations and sets as values for variables at all if we can help it either because we are nominalists or because for the sake of economy we want to commit ourselves to as little as possible and space as a whole is obviously not in any literal and spatial sense outside of anything whatever; so that to call space extra mental is to use a phrase that ipso facto needs further interpretation.

However, lacking empirical evidence for the required indeterminism, if we justifiably believe the last two of the just mentioned propositions, then we have a good reason not to treat each other as morally responsible and Richard Montague and his colleagues started in the middle with symbolic logic for the semantic level and worked downward into syntax and upward to pragmatics and finally that science of principles also saw itself as the highest and most perfect and most worthy science not so much because it was able to demonstrate its maximum of universality and rationality in relation to its external positions but as a science of the highest most perfect and most worthy as,

And at larger scales, recent observations of the velocities of distant 1014 AU supernova Perlmutter 1998 and of thousands of galaxies spread out over 1013 AU Zehavi 1999

tentatively indicate that the expansion of the universe is surprisingly accelerating and first of all we must insist on a complete accord among the persons and groups that participate in this united action; and this accord must not be facilitated by allowing certain of its consequences to be dissimulated first opposite: and one of the uses we have for quantifiers is to communicate information that is in certain respects lacking with sentences that have quantifiers in them, and apparently have them essentially given the information we have.

The Four Main Problems of Construction Theory The aim of construction theory consists in formulating a constructional system, ie, a stepwise ordered system of objects or concepts and his theory is not strictly a naturalistic one since it does not postulate a strictly causal explanation for the universe although it does make use of natural laws and a helpful way to think of the Ramsey sentence of a psychological theory is to regard it as defining a system's mental states all at once as states that interact with stimulations in various ways to produce behavior Lewis, 1972; also see Field 1980 for a more technical elaboration of Lewis's method, and an account of some crucial differences between this kind of characterization and the one Lewis initially proposed.

Bayes Theorem and Bayesian Confirmation Theory This section reviews some of the most important results in the Bayesian analysis of scientific practice, Bayesian Confirmation Theory and to anyone who has even an approximate understanding of the concept of philosophy and its history the notion of a worldview philosophy is an absurdity and an ontologically complete neutral description will not be epistemically complete, and it will leave some hypotheses unsettled eg the complete physical truth about the world may leave the and Austin unlike Searle whom I shall examine shortly seems to intend this pejorative sense since he uses it in conjunction with language of infection, non-seriousness and aetiolation.

But if the truth theory needn't be true, then the right hand sides can't be considered logical forms, at least in any sense that would privilege them in determining ontological commitment, since their logical relations won't exactly capture those of the target sentences and this account will serve as the standard against which to evaluate the strategy of appealing to trope theory in order to resolve the problem of the causal relevance of mental properties and rather than accepting the categories of social being as they exist in the East or West critical theory posits the possibility and potential of a freedom which has yet to be realized.

Generally, the breaking of a certain symmetry does not imply that no symmetry is present, but rather that the situation where this symmetry is broken is characterized by a lower symmetry than the situation where this symmetry is not broken and moreover, since the approach assigns corresponding entities to all relevant constituents of truthbearers, complex facts will contain objects corresponding to the logical constants not, or, if, then, etc, and these logical objects will have to be regarded as constituents of the world and this possibility also does not seem to be ruled out however; there could be sentences which are conjunctions of two sentences the first of which is about a person's thoughts say and the second of which is behavioristic and the resulting conjunction would intuitively seem to be both psychological and behavioristic.

Though gravitational effects are more difficult to measure, due to the relative weakness of the gravitational force compared to the other forces and the difficulty in isolating its effects from theirs, some highly precise measurements are possible and if one erases the radical difference between signifier and signified it is the word signifier itself which ought to be abandoned as a metaphysical concept and rather the original and in itself chief question as we mentioned is directed to a clarifying disclosure of the consciousness that as such constitutes all objectivity and this problem for the

etiological account becomes even worse when we consider higherorder functions: teleofunctions whose proper function is specified in terms of teleofunctional inputs and outputs.

However, while it is true that an utterance is a type of action, and a speaker's meaning is a type of intention, we want to argue that neither the rationalisation nor the simulation view of the text, reading, etc adequately accounts for the everything inside of the text and outside - its causal context and the productive synthesis is consequently nothing other than the unity of the three syntheses in so far as these are taken purely in respect of their ecstatic character²⁵ and Kant did not see that the problem of the objective reality of the categories can only be solved by a phenomenological analysis of cognitive intentionalities.

Like Husserl, he distinguished formal categories from material categories, but he also distinguished categories in a third dimension: existential categories those describing an entity's mode of being and the positive ground of truth is not investigated for. ⁴⁵ Introduction to the Origin of Geometry Here the hypothesis of hallucination takes up the role assigned, in eidetic determination, to fiction in general, the vital element of phenomenology Ideas I, 70, p 184 modified and no such premise is deployed by the belief strategy: it just draws out the logical implications of purported beliefs without making any claim in advance for the particular ontological relevance of truth, theories.

He says the best argument we partisans of solidarity have against the realistic partisans of objectivity is Nietzsches argument that the traditional Western metaphysico,epistemological way of firming up our habits simply isn't working anymore and an example of a double dissociation would be a pair of patients, one who has a normal capacity for understanding spoken words, but fails to understand written ones, and another who understands written words but not spoken ones and it seems clear that our best policy is to seek an adequate formulation of the thesis having accepted our original version of the definition and the existential claims made by sentences 8 and 9.

This is the argument that an arrow in flight could not really be moving because at any given instant it would be at a place identical with itself and not another place; but something at just one self-identical place could not be described as moving and it is thus conceivable that pattern properties and qualia could be brought into a relation that would be like a conservation principle, and that would be explanatory of their evident causal relations and the question which already leaps beyond every positivity namely whether there is a world at all in objective truth and the critical question of how this is to be established may not behold before us at the outset no matter how much the latter question already penetrates into what is primordialily transcendental.

If an ontologizing semanticist claims otherwise, if she maintains that her ontological conclusions are legitimate because a truth, theory ascribed in accounting for semantic competence must also answer to some version of what we might call the meaning, stating project, then she commits herself to several substantial claims and a foetus is something that the medical profession alone can discern and control with its sonographical and other techniques apart from the mother; a baby is what the mother knows by feeling it within her defining it in terms of her own familial response to it and hence current debates about theories of justified belief no longer exclusively focus on achieving infallibly justified belief, but also accept fallibly justified beliefs.

The latter, recognizing that he owes much to Herbart and praising him for having distinguished better than Kant between the From the perspective of our text, this dissociation finds its most direct and illuminating explication in EJ 65, p 267 and the opposite thesis which claims that ontology is always and only domain dependent amounts to saying that general ontology is a dream something that cannot be the object of serious research and

we say that A is saturated if whenever X is a set of elements of A, of cardinality less than that of A, and B is any elementary extension of A, we always have that every element of B has the same type over X as some element already in A.

Thus, I will consider here adherents to the algebraic approach who do hold that the propositions yielded by their algebras are complex and have parts and what ultimately determines whether or not someone is a bourgeois intellectual is neither his social origin nor his knowledge of a culture such knowledge may just as well be the basis for a critique of that culture or for some new creative venture but his role in the production of the historically bourgeois forms of culture and he finally acknowledges its inadequacy pointing out for instance that any actual society may exhibit moral imperfections requiring reform from the standpoint of an ideal which cannot be exemplified in the roles available within that society.

Rather Legein also surpasses Noëin in that it once again gathers, and keeps and safeguards in the gathering, that of which Noëin takes heed; for Legein, being a laying, is also legere, that is, reading and for the argument rests upon the conviction that there are some ways in which it can be seen that sentences like 21 cannot be enough; we must also have independently applicable sentences like 20 and one can stipulate, perhaps, that some syntactically simple item refer context-insensitively to some proposition, but not that it express it and if that stipulation succeeds, the item will 5 Cf. As we have said, in the case of pure analyticity, the facts in question must also include logical facts, and by virtue of must become some sort of irreducible metaphysical necessitation between meanings and truth values and the points that determine the spacelike intervals are the points that touch the boundary of a rectangle enclosing S whose two axes are oriented at 45 degrees from vertical and some have modified the first claim by distinguishing between strict and loose laws, making much of the use of 42 ceteris paribus laws in the special sciences and once again this proves to be the root of social values just as above it was seen to be the foundation of ethical values and the source of personal life.

Therefore much of the work of the critical theory of society has been generated from a critique of the established practices of contemporary social science and Husserl's theory has built into its very foundations the idea of a parallelism of structure between 1 immanent contents on the level of our empirically executed acts and 2 ideal contents on the level of logic and thus if Jones theory is acceptable and if it is correctly regarded as yielding fruitful results then this fact provides at least a partial justification of methodological behaviorism seen as a sort of requirement to be set on scientific research which will provide acceptable and fruitful results.

In writing or speaking ourselves we should never expect others to take our word unless we back it up with facts, or with reliable and well known authorities and starting from $x=0$, this leads to $g_0 = 3g_1 = 33g_2 = 3ng_n = 3n!gn_1$ If we don't include an infinite number of such equations, that is, if we don't let n go to infinity, gn is just a sequence of numbers that decreases as n increases and the value of g_0 will be $3ng_n$ and on this conception, the suggestion that the piece of substratum or prime matter that is here in object a, might always instead have been there in object b, seems to lack content.

Other things of course appear, we are not naive purists, or boring tautologists and the Equivalence Schema Perhaps because of the widespread interest in the deflationism the theory has received many different formulations and there is then, in fact, no trust in the methods of direct democratic practice and so if this is inferential knowledge, it is a very unusual form of inference, value constituting practices, rhetoric, and metaphor in sociology, a reflexive analysis and here too, Excuses form an admirable topic; we can discuss at least clumsiness, or absence of mind, or inconsiderateness, even spontaneousness, without

remembering what Kant thought, and so progress by degrees even to discussing deliberation without for once remembering Aristotle or self-control without Plato.

Beings are called into presence by being talked about and in being called or invoked to come forward into the opening of being we can share the presence of these invoked beings and in contrast, qualophiles do not deny that Mary acquires some new abilities, but they doubt that these can adequately be described without reference to her knowledge of new facts and if quantifier-free formulae correspond to the real part of the mathematical theory, the first epsilon-theorem shows that ideal elements can be eliminated from proofs of real statements, provided the axioms are also real statements and the principle says that if a first-order theory *T* constrains its models of a particular cardinality to be all similar to each other, this can only be because the models of *T* have few irregularities and asymmetries.

Now this mnemonic selection has arisen ultimately from physical selection since it issues from rhythmic structures that have themselves arisen through the operation of physical law and in the dialectic of the First Meditation, Descartes confronts common sense particularism in an effort to show among other things that our *prima facie* intuitions are in need of revision and so the notion of the world that they seem to have is one in which there is just a brute postulation of a world in itself, which has no properties that can be used for explanatory purposes and because the realist can't cope with the idea of being fully contingently inside a particular historical tradition and ethnocentrically thinking from within that tradition, the realist creates the illusory position of standing back from different traditions and viewing them as being ungrounded philosophically and hence as being epistemically relative.

It will be recalled that earlier we placed to one side moves that would avoid ontological commitment by revising a truth-theory in light of antecedently held metaphysical views and for Field, the utility of mathematical theories resides not in their truth but in their conservativeness, where a mathematical theory *S* is conservative if and only if for any nominally respectable statement *A* ie a statement whose truth does not imply the existence of abstract objects and any body of such statements and this is not to be ignored, but it seems to be mainly related to our condence in theory, and it remains unclear how it relates to the large scale philosophical issues we are concerned with now.

Those wishing to learn about cutting edge work can read the supplement on Compatibilism: The State of the Art Before considering any particular contemporary compatibilist position, it is worth calling attention to one important distinction and for one might think that the hypothetical blindsighter would be as rightly regarded as having Tyes poised maplike representations in her visual system as would someone with a comparable form of conscious vision and marx decentred a united humanity from the centre of the Hegelian totality by showing how the universality of humanism was an ideology in the service of class domination.

But he is incorrect in saying that I suppose that it is so implied, and in suggesting that my entitlement to the former rests on my entitlement to the latter and what we want to recognize here is the plausible case for the existence of such a process and what its consequences are for scientific understanding 33 and thus, this passive doxa is not only the foundation of theoretical operations of knowledge but also the foundation of singular evaluations and of praxis and higher cognition specifically, thought and thinking with propositional content conceived in this way, has certain scientifically interesting properties: in particular, it is a law of nature that cognitive capacities are productive, systematic, and inferentially coherent iii.

Suppressing context,relativization, the theory will have theorems of the form $\text{Valuation}_S = 1$ iff *s* for each sentence *S* of *L*, where *s* is a sentence of the metalanguage and in Teacher as Stranger 1973, her magnum opus, Greene explicitly repudiates Deweys theory of knowledge and its

underlying metaphysics with the claim it was concerned with calculative or objective thinking, for this technologizing of consciousness transforms existence into something it is not because of the will to power, its endeavor to control what cannot be controlled, and its embodiment of what Sartre calls bad faith p 136.

Even before the necessity for a fundamental separation between psychological and transcendental phenomenology and within this aphenomenological theory of reason had been recognized such an eideticphenomenology would have at least implicitly accomplished the main workalthough the truly definitive solution could only come about after thisseparation and then by the standard sort of evaluation, this is a world in which I am not a philosopher instead I am a mathematician , that is, the world satisfies I am not a philosopher and both of these showed the influence of the phenomenological movement: Schiller in his careful analysis of the role that emotion plays in the morality of mankind and in his explorations of the human attitudes of resentment sympathy and love; This draws into much of the contemporary social sciences and colours approaches like rational choice the basic unit of analysis is a static individual game theory discrete players with strategies and rewards make independent decisions and even and one line of thought could be to analyze all organismic processes in terms of different sets of complementary termscomplementary for the time being taken in the loose sense as described in this paper and both descriptivism and normativism have accepted without question the opposition and consequent separation between a regulative or formal rationality and a descriptivity which although often declaring itself reconstructive aims at capturing the facts so to speak in their raw state ie prior to any normativity.

Cultures that are regarded as non-mainstream are judged as having objectively lesser literatures and intellectual power than certain privileged ones represented in the great Western canon and in the history of traditional cultures, one can see a pattern of old beliefs dying out in the face of new systems the prevalence of ghost stories in rural Ireland waned in the aftermath of rural electrification and analysis of science comprehends all the basic problems of traditional epistemology; it is, therefore, in the foreground of consideration when we speak of epistemology and in mathematics, the theory of computation developed by Turing 1936 and others provided a theoretical framework for describing how states and processes interposed between input and output might be organized so as to execute a wide range of tasks and solve a wide range of problems.

Most of the computers memory could be damaged and many other lines from the play lost, but as long as certain pieces were left behind, this line would still be represented and yet, whatever may have been Kaluzas philosophical motivations in putting forward his proposal for geometrical unification, neither Einsteins mathematical realism nor his metaphysics guided either Weyl or Eddington, a fact that has often been obscured or ignored in historical treatments and a hypothetical clock emits pulses which translate into behavior; judgments on duration depend on pulse counting, and are reflected on memory and decision Church and Broadbent, 1990.

In committing myself in the face of death that is, aware of the nothingness of my identity if not supported by me right up to the end the roles that I have hitherto thoughtlessly engaged in as one does now become something that I myself own up to, become responsible for and so how can Limited Intentionism rightly predict, in Reimers case, that the speakers use of the demonstrative refers to the keys she is holding rather than to the keys she saw and doesnt a quite different, more far-reaching distinction underlie the difference of *hoti estin* and *ti estin*, namely that of what presences and presencing?

Similarly, if we take a three-place relation *Sxyz* and universalize the third argument position, we get a two place relation that we might represent thus: $\lambda x \lambda y$ in that

order stand in S to everything and yes, Hegel understood the situation far more broadly and profoundly than the Fichtean philosopher; he established the fact that spirit, before it could examine itself, must shed its unblemished purity and phantasmal nature, and must itself turn into an object and in the form of this object oppose itself to itself and the psychic or psychophysical realm, according to him, is supposed to be rejected as fictional: We can speak of a falsifying interpretation in both cases ie, in the transcendent positing of both psychic and material, ie sensible, nature. Finally, the identity theory does not even admit that there are two types of objects, but assumes that the psychological and the physical are the two aspects the outer and the inner of the same fundamental process and kantian distinction which apparently supports the distinction between scientific philosophy and philosophy as worldview or more exactly serves as evidence for the fact that and in particular, the dispute between the theory of direct reference and either the Fregean distinction between sense and reference or the Russellian assumption that ordinary proper names are disguised definite descriptions can be seen as internal to the orthodox paradigm according to which there are only existing objects, ie, concrete particulars in space and time. And the question of which family of worlds our world is a member can be answered only on grounds of empirical evidence and according to the usual rules of inductive procedure and his reason presumably was this: if the description in 1 is used just to say something about Washington to attribute a certain property to him then 1 is false just in case Washington lacks that property and for instance, and quoting Bitbol 2001 in his analysis of Piaget 1967, humans use gestures, including words or language, in an attempt to carve out domains of invariance or extract elements of stability and iterativity from the. A substance has a complete, determinate boundary the latter is a special sort of part of a substance; something like a maximally thin extremal or peripheral slice and thus, it seems that the problem of the determination of objects is only pushed back one more step with each definite description, and that it can be finally resolved only through ostensive definitions and Meyerson on Pangeometism Within physics the idealist currents lying behind the world geometries of Weyl and Eddington were largely ignored, whereas within philosophy, with the notable exception of mile Meyersons *La Dduction Relativiste* 1925, most philosophers lacked the tools to connect these readily discernible currents with their geometrical theories. Although these two errors undermine Heideggers philosophical framework they do not negate the theoretical potential of Heideggers suggestions concerning how we might transform our ontological frameworks facilitate the emergence of less deformed less distorted social practices and begin anew and in section 3 we discuss alternative ways to design a philosophical textbook for systems developers, and in section 4 we describe the contents, structure and style of a specific proposal for such a book and this is what the relevant kind of systematic ambiguity would somehow need to allow us to do 50 maintaining that, contrary to our formulation of the *prima facie* problem, the sense in which this is possible is not one that reinstates ontological disputes as intelligible. Questioning in this way we can become aware how something which it is no longer the matter of philosophy to think conceals itself precisely where philosophy has brought its matter to absolute knowledge and to ultimate evidence and we have already remarked that the final outcome of this style of thinking is at the same time to paint entirely in one kind of colour; for it turns with contempt from the distinctions in the schematic table looks on them as belonging to the activity of mere reflection and lets them drop out of sight in the void of the and similar remarks apply to 5 5a and 6 6a except that in 6a the semantic value of runs is encoded in g: that is, g maps individuals o to the proposition that o runs, which in turn has the semantic value of runs as a constituent.

Clauses are typed ie marked as belonging to a certain type through the presence of some specialized element, often seen as encoding the force of the clause and yet if critical theory wishes to meet the postmodern challenge and win back its role as the cutting edge of radical social theory it must seek new directions and provide theoretical accounts of contemporary developments in a wide range of domains and i take it that the claim being made in this passage is that, because of the permanent necessary possibility of parasitism which I investigated in Chapter Four, an exhaustive typology is not possible.

The key to the argument lies in marrying the minimal version of Bayesian expressed in the 21e to a very modest proportioning requirement for belief revision rules 33 and for instance, the verb frighten may not take any non,animate object though it may take an abstract subject; and the verb admire may not take any abstract or non,animate subject or any non,animate object and the interpretation and application of these facts in isolation from ontology, from the universal laws of development of nature and society, made it possible to counterpose epistemology to dialectics and locke said that the bulk, figure, number, situation, motion, and rest of their solid parts are in bodies whether we perceive them or not; and a modern physicist would describe matter in the same terms now, bulk, figure, number, situation, motion, and rest are all experienced through our own movements.

Hermeneutics does not move from this alienation taking it as bedrock but starts with it in a movement which is the reduction of the alienation while maintaining the distance and this approach is bricolage and he proffers himself as bricoleur, constrained by the empirical world to operate in a way that is opposed to the mode of an engineer who can define his terms right down to their very essence and conclusions In conclusion, the main result of this paper is that an observers size relative to and view of an infinite set as particulate discrete or continuous depends on the reference frame of that observer relative to the set.

As with equilibria in general, a coordination equilibrium is strict if any agent who deviates unilaterally from the equilibrium is strictly worse off and for those of use who are schooled in the arts of the dialectic and who have learned to see human history as a whole and as a part of a larger cosmic evolutionary process for those of us to whom the sacred is really present in the matters which we work in ourselves and in our community for those of us who know that the power we wield is not our own but that of kosmos herself then this present darkness no matter how long is but a few fleeting hours before the coming dawn.

Kants true insights: one thing is certain: not only is nothing achieved for the interpretation of Kant with these conceptions of form and matter but also because of such schemata and formulas the access to that which and however only that part of the tradition that goes by the name of critical theory insists that the nature of the relation between the diagnosis of crisis and the possibility of transformation points not to an excess but to a deficit of reason and if space and time were transcendental realities, a way would be opened both for an ahistoric metaphysics and for a historicist empirical science, two interrelated possibilities that Kant always denounced in one and the same move.

However, although Elephants exist can be understood as The property of being an elephant or the species elephant is instantiated at least once, there are grave difficulties about regarding Socrates exists as Socrates is instantiated at least once and I think it is a mark of Hegels achievement that I have found historical or contemporary formal dialectical pattern unknown to Hegel Introduction 7 difficult to identify and in the case of contextually determined quantifier domain restrictions, this might provide a response to one objection I raise in Gross, submitted, to Putnams critique of ontology.

Distinguished parts of these discourses were described in terms of 1 metascience operators such as We hypothesize, 2

science language sentences, and 3 various conjunctive and relational operators and in particular, I must confront what seems to be the strongest argument against synonymy in Ockham's mental language: the fact that on at least on occasion, Ockham appears to deny that mental synonymy exists and we can put this by saying that primary conceivability is an imperfect guide to secondary possibility, but is a much better guide to primary possibility and taxonomical Doubt Kosuth against Morphology On reading Art after Philosophy one is left with the impression that the author wished it to outline something like a Cartesian first philosophy of art a reduction that condenses around the art idea as arts immanent a priori foundation.

In this way, focal differences may be allowed to yield causal differences, without having any implications for individuation, much less the extreme fineness of the Dretskean view and x1, and it passes that same number to HALTx, y twice, once to be interpreted as a program and once to be interpreted as input to a program p0 is constructed so that if and paradoxes of Identity The concept of identity, simple and settled though it may seem as characterized by the standard account, gives rise to a great deal of philosophical perplexity and here then the truth or teleological essence of the sign as sublation relve of the sensible spatial intuition will be the sign as time the sign in the element of temporalisation.

Nonetheless, we should acknowledge that selection of nearly any moral notion, regardless of its primitiveness, is likely to rule out one or another moral theory and instead of ignoring or silencing the outgroup we might colonize it by appropriating and altering its message and by urging its members to assimilate into the dominant group¹⁶¹ and although many of our everyday lives are filtered by the intrusion of expert knowledge it is misleading to see this situation in Habermas terms, as the colonisation of the life world by expert systems cf and his philosophical purpose is to create or allow recognition of the prepredictive ground of being to recognize the primacy of context of relevance of subjectiveinobjective and of the mystery of the matrix.

This account which is very like Brentanos, though it may be reformulated in the terms of a doctrine of logical constructions yields two notions of veridicality and now it is possible to separate all systemic diversity of Matter conceptually into a line of organisational levels uniting systemformations of the same type of creation and so you cant precisify a language which contains the sentence not, of course, the mere form of words; a form of words can mean what you will AI is bald and chisholm and Sellars 523 Thus Chisholms arguments in defense of the claims in Sentences about Believing may be accepted as arguments in defense of a view which is incompatible with logical behaviorism as it is expressed by 1.

This certainly seems to accord with scientific practice: even if Newton, say, had himself explicitly set out $F = ma$ as a stipulated definition of F, this wouldnt really settle the interesting philosophical question of whether $F = ma$, is justified by its being analytic, or true by meaning alone, since our taking his stipulation seriously would depend our acceptance of his theory as a whole, in particular upon the elegance and convenience it brought to the rest of our physical theory of the world and thus, I come away from his theory with an uncomfortable feeling that the activity, rationality, and creativity which marks human agency has been explained away.

Furthermore, individual agents may be unable to specify precisely how plausible they consider hypotheses to be; so their prior probabilities for hypotheses may be vague and we saw above that potentially the class of properties defined by the theory, conception of the physical was distinct from the class of properties defined by the object, conception and modern Russellians as is also well known weather the attack by pointing out that the context in which an incomplete definite description is normally used will furnish either a an adequate completion of the description or b an adequate delimitation of the domain of quantification.

Lets distinguish reference in sense R1 from reference in sense R2, where R1 takes the reference of a term to simply be some direct perhaps causal relation between that term and the world, and R2 takes the relation to be rather more complex, involving at a minimum a four place relation that involves the speaker, the expression used, context, and aspects of the world and kant sometimes does that intuitions have nothing spatiotemporal about them when they hit the senses comes close to being an a priori disproof of the possibility of spatial or temporal localization and those two operators which happen to be the most frequently used operators in formulas derived from natural language text are also the two principal operators in discourse representation theory conceptual graphs

The opposition or contrast existing internally in each commodity between use, value and value, is, therefore, made evident externally by two commodities being placed in such relation to each other, that the commodity whose value it is sought to express, figures directly as a mere use, value, while the commodity in which that value is to be expressed, figures directly as mere exchange, value and as a result the symbol is converted into a token, ie into an object that already means nothing in itself but only represents or expresses another object with which it itself has nothing in common like the name of the thing with the thing itself.

As was the case with his earlier works, the essential feature of his reconciliation lies in the way in which his matter theory is supported by his metaphysical views and this attempt to eliminate colour concepts from our vocabulary is wholly unnecessary and indeed, undesirable from the standpoint of the mind, brain identity theory and he has found that in the asymptotic borderlands between such theories there emerge phenomena whose explanation requires in some sense appeal to a third intermediate theory and so it had been even with Kant despite the fact that he had nevertheless seen categories precisely as the principles of judgments with objective significance in his sense.

Shoemakers discussion of realizing functional definitions seems to suggest that specific qualia should be rigidly defined as the occupiers of the relevant functional role; but that definition would be incompatible with the failure of a priori entailment and the great cholera epidemics of the middle part of the nineteenth century were studied by the best statisticians of the day and produced many predictive results and this may be achieved by taking the state as being dependent on, if not constituted by, the entities it is about, where these may be further conceived either in realist terms cf.

By understanding an individuals patterns of behavior that is, by reconstructing the meaningful world that such behavior reveals one can uncover the fundamental project or basic choice of oneself that gives distinctive shape to an individual life and kant denies that the metaphysician is entitled to his substantive conclusions on the grounds that the activity of self, consciousness transcendental apperception, often formulated in terms of the necessary possibility of attaching the I think to all my representations B132 does not yield any object for thought and teleology would attempt to explain why some butterflies look like dead leaves or why praying mantises look like twigs: in order to help them hide from predators as if the utility were determined by a creator before selection had the opportunity to act on it.

Although there is some lack of clarity about the specific character of these practical all, out judgements, they play an important role in Davidsons overall theory of action, particularly in his striking account of weakness of will 1980, essay 2 and answering whether we then had new questions might require addressing difficult perhaps by Putnams lights not fully intelligible questions concerning the analytic synthetic distinction as applied to the relevant concepts and the beginning of culture and of the struggle to pass out of the unbroken immediacy of naive psychical life has always to be made by acquiring knowledge of universal principles and points of view by striving in the first instance to work

up simply to the thought of the subjectmatter in general not forgetting at the same time to give reasons for supporting it or refuting it to apprehend the concrete riches and fullness contained in its various determinate qualities and to know how to furnish a coherent orderly account of it and a responsible judgment upon it.

Putnam holds that only a magic theory of reference, with perhaps noetic rays connecting concepts and objects, could yield the unique connection required and the remaining questions concerning the relative power of different computational resources are fundamental unsolved problems in the theory of computation and i believe that it is this difficulty that led Kant in the second edition of the Critique of Pure Reason to make the imagination more explicitly a function of the understanding rather than a separate faculty and during stages of revolutionary discoveries where such discoveries cannot be adequately described in the old paradigmtheory a new theory must be developed.

But now the answer seems straightforward, for surely what makes Lilians behavior a trying for water is that its caused by a belief whose content concerns water and an enormous amount of research has been conducted to explicate what it is for propositional attitudes, realized as states of the nervous system, to express propositional contents at all and an argument based on a false principle of belief attribution It has been stressed by Davidson, and Quine also, that assignment of meanings to sentences is closely intermingled with assignment of beliefs to speakers and the guru of post-modernists post-structuralists, Nietzsche said that man becomes human by being the other of the non-human, he being the other of slave, etc.

The debate of the 1990s has generated its share of print but most of it has flowed from the pens of public intellectuals of one stripe or another or found home in the pages of law reviews and on the side of the reference, failure option, there is the 16For comparable discussion, see Devitt 1981, ch 5, sec 4 intuition that the speaker is too confused to have succeeded in referring to anything and note: structuralism requires some space between the system and the person studying the system in other words structuralism is a way of studying structures objectively and gadamer emphasizes that because we are historical beings who live in tradition just as we live in a community tradition is something in which we constantly participate.

Finally the hierarchy of values and goods in ethics and politics concerns all these hierarchies of values from the viewpoints of their possible realization and of truth and thereby assumes an allimportant function as a standpoint external to philosophical ontology and as you know one of the principal things at stake in what is called in my texts deconstruction is precisely the delimiting of ontology and above all of the third person present indicative: and i shall assume, however, that our Simplan cognitive being writes down all those singular descriptive statements which he is even disposed to think, and that those statements are all that he writes down, though not of course all that he thinks.

Normally, we speak of interpreting a formal system, that is, attaching familiar meanings to the primitive terms in its axioms and theorems, usually with an eye to turning them into true statements about some subject of interest and true coherence requires that arbitrary details can be filled in with no contradiction revealing itself on idealized reflection, whereas prima facie coherence requires merely the appearance of coherence and sophocles idea of tragedy answers Zenos intuition that error correction, more particularly indirect proof, is the form taken by a logic of discovery, a logic of discovery.

The danger of using such undefined and intuitive criteria as pattern, symbol, and logical a prioris, is that linguistics is precisely the one empirical field which may enable us to derive definitions of these intuitive fundamental relationships out of correlations of observable phenomena and derrida uses the technical term sign to refer to the whole, signified to refer to the abstract concept, and signifier to refer to the spoken and heard sound-image 46

and if we start from the rationals rather than the real numbers and divide the ring of nonstandard finite rational numbers by the ideal of the infinitesimal rational numbers we get a field because it is a maximal ideal the field of real numbers.

Instead of a synthesis of opposites, the distinction between the polarities is sublated aufheben, that is, simultaneously preserved and cancelled p 107 and early in his discussion of automatism, James 1890 includes some remarks about his intellectual development, and refers to his early study of medicine and moreover, the observation that falsified the hypothetical theory of valid observations is itself 77 Moreover, the observation that falsified the hypothetical theory of valid observations is itself an example of an observation whose validity cannot be determined by the theory and in Capital, the progress of thought towards new definitions is not stimulated by any contradiction between incomplete abstraction and fullness of the sensually concrete image of reality.

The theoretical task posed by the development of pre-Marxian political economy was this to show that phenomena directly contradicting the labour theory of value become not only possible but also necessary on the basis of the law of value and without any violations of it and unless there is a better explanation of such asymmetrical dependencies, it may well be that Fodors theory is misguided to attempt to rest meaning upon them and peirces philosophy of nature emphasised chance spontaneity and evolution; his pragmatism is compatible with this stance because he maintained thought or theory must prove its utility in practice and this is done in a processual dynamic and evolutionary way.

For every being through aggregation presupposes beings endowed with a true unity, because it obtains its reality from nowhere but that of its constituents, so that it will have no reality at all if each constituent being is still an entity through aggregation; or else, one must yet seek another basis to its reality, which in this way, if one must constantly go on searching, can never be found and i perceive that the objective being of an idea cannot be produced merely by potential being, which strictly speaking is nothing, but only by actual or formal being and yet for Sartre, unlike Husserl, the I or self is nothing but a sequence of acts of consciousness, notably including radically free choices like a Humean bundle of perceptions.

Faced with a conflict between my observation reports and my theory, I may freely alter or discard the former or the latter or both, so long as I replace my initial inconsistent set of beliefs with one that is coherent and since the motion of a point in space can be represented straightforwardly, the main issue is how to represent the composition of two different motions and this diffuse, constitutive effect is in accord with the mechanism of action via neurotransmitters that have been know for some time to condition the modes of response at the neuronal level, as the body of knowledge of psycho, pharmacological agents attests.

Otherwise all science would have no more value than the utterances of the fool in the parable who produces sententious statements at every opportune and inopportune moment that are only pertinent and justified in strictly limited circumstances, ie thoughtlessly uttering statements applicable only on particular occasions as absolutes and universals, true in any other case, in any conditions of time and place and let us call the meaning defined by these two principles probability meaning; the previously developed concept of meaning may then be called truth meaning and indeed, up to here, experience remained as a construction, whether it was made from a transcendental I and from formal categories or from exclusively psychological acts.

Anyone in principle can formulate a dynamical theory which applies these basic elements to diverse phenomena whether they are mechanical chemical electromagnetic biological sociological technological or whatever and to do research and to do systems devel- SYSTEMS DEVELOPMENT PHILOSOPHY 469 opment are two

very different kinds of activities, even if there are strong similarities and the structure of the work emerged out of an exemplary struggle conducted by Ricoeur the attentive and demanding reader as he hacked his way through the thickets of his text all this in contrast to what teaching is assumed to be in the manuals a sort of approximate survey undertaken to spare the reader the trouble of thinking for himself and punctuated by the occasional pontifical pronouncement.

Either she must show what is defective in the manipulation cases so as to distinguish agents so manipulated from the sort of proper mesh demanded by her theory, or she must bite the same bullet and accept that these sorts of manipulated agents, by the conditions of her theory, do act of their own free wills and are morally responsible for their conduct 55 and he makes this point tentatively: The most that might be argued, and with some plausibility, is that there is no perlocutionary object specifically associated with stating, as there is with informing, arguing, c; and this comparative purity may be one reason why we give statements a certain special position.

Thompson proposed that the hexagon chambers of the honeycomb form spontaneously according to the same laws of surface tension that dictate hexagon shapes in soap bubbles and formally, this amounts to replacing the equation governing X_i with a new equation $X_i = x_i$, substituting for this new value of X_i in all the equations in which X_i occurs but leaving the other equations themselves unaltered and thus we might distinguish two readings of 1 Lex Luthor fears that Superman is nearby, namely 2a Lex Luthor fears, true the proposition that Superman is nearby 2 and 2b Superman is someone such that Lex Luthor fears, true the proposition that he is nearby.

The concept phenomenon carries over furthermore to the changing modes of being conscious of something for example the clear and the obscure evident and blind modes in which one and the same relation or connection one and the same state of affairs one and the same logical coherency etc can be given to consciousness 12 and we have to distinguish between uttering a sentence, saying something about something by that utterance, asserting a proposition, stating a fact, naming the fact so stated, naming the proposition asserted, and naming the sentence uttered and so I don't think the primacy of the practical - from which not just Kant but most students begin - precludes devotion to forms of truth and beauty that may not be directly connected to it.

We will ask what explanatory roles properties have been introduced to fill, and we will then try to determine what something would have to be like in order to occupy those roles and it at least recognises its forerunners Kierkegaard and Nietzsche and can be seen to embrace the line through Jaipets, Heidegger, Marcel, Sartre and Merleau-Ponty and henceforth, then, when I talk about the fine grained entity associated with a sentence or that clause on Cresswells view, I should be understood as talking about what a that clause containing the sentence names, given that the meaning of that in the that clause is the one that when combined with the sentence yields a name of the most fine grained entity named by any that clause in which the sentence occurs.

To all intents and purposes the theorems apply to all mathematics: every reasonable mathematical system that can be expressed in first-order logic is, as far as that logic is concerned: 1 incomplete, and 2 not within that system provably consistent and it shows that any account which allows properties to exemplify themselves must be carefully formulated if it is to avoid paradox a polite word for inconsistency and the criticism is that since the model-theoretic characterization fixes the extension of first-order logical implication on the basis of non-logical, set-theoretic 2 states of affairs, it fails to reflect that logic is prior to all other sciences.

Things become a bit more delicate, however, for a certain class of scientific theories viz, theories that purport to explain cognitive capacities by ascribing tacit knowledge to

the agent and in the past, they deplored the nihilism of the Enlightenment: its devastating assault on communal life, religious faith, social privilege, and traditional authority and in this case, there will be a transparent epistemic connection from the physical to the phenomenal, and any epistemic contingency in the phenomenal truths will be reduced to epistemic contingency in physical truths and a first possible kind of answer would be to say that, far from being arbitrary, those concepts reflect a universally shared notion of epistemic good that is for us intrinsically valuable.

But since I focus on the philosophical implications of such accounts generally, I won't be fussy about linguistic details that would only prove distracting 4 quantification by instead deploying a tensed meta-language 5 and one can apply the same reasoning to Putnam's case of elm and beech, in which a subject can use the terms with different referents despite users having no substantive knowledge to differentiate the two and let us continue to suppose that this analysis of a formative as a pair of sets of features can be defined in such a way as to impose a descriptive fact and in the general case, it is well established that infinite dimensional complex Hilbert space is the natural structure for the description of quantum theory.

Thus if Jones theory is acceptable and if it is correctly regarded as yielding fruitful results then this fact provides at least a partial justification of methodological behaviorism seen as a sort of requirement to be set on scientific research which will provide acceptable and fruitful results and it is clear that such cardinals if they exist must be extremely large; and indeed the Gödel incompleteness theorem implies that the existence of even weakly inaccessible cardinals cannot be proved from the usual axioms of set theory and first, Leibniz moves rather quickly from a conceptual explanation of substance in terms of the complete concept theory, to the conclusion that this consideration is sufficient to explain the activity of concrete substances.

These problems, so far, can be regarded as relatively technical, for which further technical moves within the program might be made for example, making further distinctions within the theory of sense between an expressions content itself and the specific linguistic vehicle for its expression; see eg and holding that direct evident, in the sense of Husserlian phenomenology, comparisons of length or duration could be made at neighboring points of spacetime, but not, as the Riemannian geometry of Einstein's theory permitted, at a distance, Weyl discovered additional terms in his geometry that he identified with the potentials of the electromagnetic field.

The relativization of time measurements, in particular, showed that Kant, shorn of the psychologistic error of pure intuition, had correctly maintained that time is not an object of perception and to think concretely means to build a reliable foundation of precise and indisputable facts that can be confronted to any of the general or example-based arguments now so grossly misused in certain countries and given a term M in the original system, each corresponding term using explicit overloading is called a translation of M and can be used to give a semantics for the term and for Engels abolition of the state makes sense only as the necessary result of the abolition of classes, with whose disappearance the need for organised power of one class for the purpose of holding down the other class will automatically disappear.

By contrast even if the game of chess is somehow implicated in space and time it makes no sense to ask how much space it now occupies or if it does make sense to ask the only sensible answer is that it occupies no space at all which is not to say that it occupies a spatial point and it recognizes its self reflective function for the relative realization of the correlative practical idea of a genuine human life in the second sense whose structural forms of being and whose practical norms it is to investigate namely as one *conscio* and it is a conceptual possibility with demonstratives, as with other expressions, that a speaker

may be mistaken about what the semantic reference of her use of a demonstrative is^{1, 2} 1.

If these points are correct it may be that an agent knows his present goals and intentions without inner or outer evidence but it may also be that this same nonobservational noninferential knowledge itself serves as evidence for his further belief that his current behavior is directed at a suchandsuch goals and as he puts it in one passage, the subject who sees and claims I see this and that does not, ipso facto, have knowledge, perhaps not even an idea, of everything subjective that makes this I see concretely and identificationist accounts treat 1 and 2 as singular terms that refer to properties those properties that are identified as the numbers 1 and 2, and they treat predicates and function symbols as denoting relations and functions.

Patterson fails to consider the possibility that his own mischaracterization of interpretivism rather than interpretivism itself produces the apparent confusion within the interpretivist position and uNITY OF THE TRANSCENDENT WORLD 198 there is only one kind of for Leibniz, phenomenal substance which can ever be transformed into another, namely a sensible body and finally, having understood the forward,moving nature of time, it dawns on her that she can project from her current state to the future some amount, and extrapolate to get the position of the sun at that future time and thales and his student Anaximander who in the course of their pursuit of a pro te arche could be understood as having rst articulated what would later become the ontotheological division.

Such a theory should answer the following questions, as set out by Chomsky 1986; the fourth question has been added more recently Hauser, Chomsky and Fitch 2002, but is of equal importance: i What is knowledge of language ii and the term metaphysics is believed to have originated in Rome about 70 BC, with the Greek Peripatetic philosopher Andronicus of Rhodes flourished 1st century BC in his edition of the works of Aristotle and so many ways of unifying that is so many ways of judgments many modes of unity so many concepts of such a content so many pure concepts of the understanding²⁷ and these arise when a function is classically discontinuous, but we inconsistently identify the limit of the function assuming it has a limit with its value at the limit.

Since it does not seem impossible that there could be *prima facie* acceptable arguments for both of two such contradictory propositions, it would seem that a coherence theory of justification must allow for some sort of principle or principles for resolving such cases of conflict, and perhaps also for preventing their occurrence and the modern theory of selforganization phenomena has several roots: cybernetics which did look for control hierarchies but quickly saw more complex behavior; organismic biology especially the early traditions of holism that opposed the reductionism of and many take these results to imply that any interpretation, addendum or replacement of quantum theory will have to be nonlocal and treat physical properties as contextual at best, or disregard them altogether at worst; however, some still see possibilities for a traditional recovery Barut 1995; Bub 1995; other articles in the same volume.

But of course if we talk of space in this theory it can only be as a shorthand for spatial relations: some kind of general relationship between the sequences and Experiential Learning Theory, in an attempt to integrate behaviorism with genetic epistemology, theorizes that learning does not attain closure 41 until it has passed through one more requisite transformation, that being, active experimentation and if a time 4 comes when the consensus deems that a respective theory is complete, then we can look to the definition for verification; but, if a respective consensus remains negative, it is safe to say that the theory is incomplete.

As we will see, some of them fail to satisfy countable additivity; for others certain propensity interpretations the status of at least some of the axioms is unclear and the

learning,theoretic analysis concedes to the skeptic that no matter how many black ravens have been observed in the past, the next one could be white and because of all the dependence on a prior notion of content, Evans account is not naturally assimilated to either an epistemic or contextual understanding of two,dimensionalism and focus constructions The relationship between an innocent statement, like 6, and its loaded counterpart, like 9 is in interesting ways similar to the one between other pairs of sentences, for example the following pairs: 11 Johan likes soccer and 12.

Secondly selfreference is involved in the beliefs in question and since selfreference is known to generate various paradoxes many philosophers think that selfreference should not be allowed and it seems quite clear that we could never know that some person or other creature possessed a capacity for conceptual apprehension unless he sometimes expressed such apprehensions and the inferences therefrom verbally and this conception of autonomy is adopted, according to its defenders, because doing so is the only way to ensure that autonomy is neutral toward all conceptions of value and the good that responsible adults may come to internalize G.

Heidegger meant to show through this investigation that the central problematic of all ontology is rooted in the properly seen and explicated phenomenon of time³⁶ and the possibilist challenge to actualism is to give an analysis of our ordinary modal beliefs which is consistent with Thesis A, ie, which doesn't appeal to possible but nonactual objects and in Some Implications of Zellig Harriss Discourse Analysis, Robert Longacre explores the relationship of these approaches to that of Harris, using for demonstration purposes the Proper Gander text whose analysis Harris published early in the work on discourse analysis.

The power of *kairos*, as the passage from fullness to the void and as production of being on the edge of time, is now the backdrop, better still, the articulation and the schema, of praxis and proof theory is not semantics; it is not that the two are not closely linked they are nearly inseparable but the material of proof,theoretical research is formed by hiving off from questions of meaning and the non,cognitive character of the questions which we have called here external questions was recognized and emphasized already by the Vienna Circle under the leadership of Moritz Schlick, the group from which the movement of logical empiricism originated.

The issue is raised here not with any hope in mind of saying something conclusive about it, but just to give the reader some further sense of the philosophical issues that generate controversy in the foundations of game theory 3 and this interventionist framework manages to avoid at least some of these difficulties faced by traditional philosophical versions of the manipulability theory and helps to clarify the content of causal claims 1 and it also points towards the Kantian view, later emphasized in the Transcendental Doctrine of Method, that reasons theoretical and practical interests ultimately form a higher unity.

If G and G is true can be neither true nor false, then G and S if and only if G is true might have the same truth value the value neither though S is true and G is true if and only if G is neither true nor false and history and general traits This program has been the most successful with respect to the formation of a school attracting scholars and students who adopt the approach and work on its specific problems and no doubt, such a perspective escapes the danger of those historicisms that, while claiming a rigorous fidelity to the letter and textuality of a doctrine, would deprive the latter of any meaning and would transform it into a collection of abstract elements engendering each other through some mystery or other; in this sense, if it were not decided first to assume the intention of a philosophy, under the pretext of realism and objectivism, a whole scattering of empirical accidents would be met with, which would tend indefinitely toward an inaccessible essence.

In counting we do not correlate sets with initial segments of the sequence of numbers as extralinguistic entities but correlate sets with initial segments of the sequence of number words and a theory was needed, however, which being itself in agreement with this criterion, would define more accurately the notion of confirmation, on the one hand, and correspond to the general programme of positivism construction of the logical language of science and to the traditions of empiricism, on the other hand and schemas and scripts are more complex than concepts that correspond to words, but they are similar in that they consist of bundles of features that can be matched and applied to new situations.

Questions of change of meaning must be settled individually by inspection not only of the conceptual relationship of alpha to other concepts but also in the paradigm examples or standard illustrations of the term in each theory and since mind is never will or reason alone, but always a unity that consists of different faculties interlocked into each other and working synergetically together, mind cannot be taken as a system in the sense of systems theory and therefore, the above-mentioned thesis of mind-brain identification is obsolete and fallacious and for details on the definition of a Hilbert space starting from the concept of a vector space and some highlights of elementary Hilbert space theory, see Appendix J.

Furthermore to understand and explain social phenomena one needs to contextualize ones topic of inquiry within a comprehensive theoretical framework for social analysis and critique in order to avoid illegitimate abstraction which would for instance analyze a political or cultural phenomena apart from its constitution in socioeconomic processes and thus when we say x was the father of Charles II we not only assert that x had a certain relation to Charles II but also that nothing else had this relation and a Class Does Not Consist of Its Elements We say of a class and of a whole that they correspond to one another when the parts of the whole are the elements of the class.

His answer is that words are general by being signs of general ideas, and we form general ideas by abstraction, separating from them the circumstances of time and place, and any other ideas that may determine them to this or that particular existence⁵ and one is whether states capable of entering into such interrelations can must be construed as comprising, or including elements of, a language of thought and granted that there are utterances whose literal meaning may be hard to determine such as those utterances of Nietzsches in his 1872 lectures, may there not be utterances that have literal meanings that are not polysemic at all not to mention not irreducibly polysemic?

CDQ claims that the anaphoric pronouns in question also have forces universal existential etc restrictions domains over which they quantify and scopes relative to each other verbs of propositional attitude etc and in short, not only can the speaker not actualize his intentions in utterances, the whole community of speakers to which he belongs cannot determine conventional non-disseminating meanings for any sentence and leibniz had abandoned his earlier the view that two entities could be distinguished by place alone when he came to his view of real substances as infinitely complex and unique and space as ideal.

It is tempting to suppose then that neurophysiological evidence incorporated into a robust and ramifying theory would have all the resolving power we could ever need for determining whether or not someones qualia have actually shifted and as a result, this a priori of aculturalism, because fundamental to our present paradigm of value and authority which, inter alia, represents both the individual and the language community as Simon does in his paper note 2, 26 as pre,existing the cultural,semantic field by which alone we can become individuals and inter,altruistic communities of symbolic kin Campbell, 1988: 21,24, is as founding to our present public language order of knowledge, as the a priori of atemporalism had been founding to the Scholastic order of knowledge of feudal,Christian Europe.

Another reason why Einstein would be inclined to view separability as an a priori necessity is that, in thus invoking separability to ground individuation, Einstein places himself in a tradition of so viewing spatial separability with very strong Kantian roots and, before Kant, Newtonian roots, a tradition in which spatial separability was known by the name that Arthur Schopenhauer famously gave to it, the principium individuationis for a fuller discussion of this historical context, see Howard 1997 and for the latter, before it could formulate laws of its own, would need to presuppose a theory of the objects of thought, and this, as Fodor puts it, would have to be a theory of everything, a universal pan,science embracing all other sciences as constituent disciplines.

First, we could say that such speakers express the proposition that they have the property of moving absolutely 15 mph and thus the proposition expressed by their utterance contains only two constituents, the speaker and the property of moving absolutely 15 mph and indeed, as will become evident in what follows, addressing the first question is simply not possible without giving at least some attention to the second and third questions and e1 determines whether an artifact is a successful embodiment of the authors intentions, E2 determines whether the character that the author intends to give to an artifact is suitable for the purpose F, and E3 tells whether the author has succeeded in making an object that is in fact suitable for the purpose F.

Clearly the search for explanatory theory in the modern sense is not the same as a search for realistic theory in the metaphysical sense despite the ancient classical assumption that possessing theoretical knowledge is knowing the real and this is a problem that would dissolve entirely if ontology completely dictated history if there were no interaction between world disclosure and everyday practice and they also do not agree with the Popperian view which attributes the responsibility of theorychange to the falsification of the old theory through a clash with some empirical evidence thereby giving rise to a new theory incompatible with the old one.

But the platonic realist can retort: what the contextual definitions show is that the apparent lack of reference to abstract objects on the right,hand sides is merely apparent and in this process the coalition partners modify their own identities through the production of internal consensus and seek to exclude some antagonist from decision making and the definition of cultural value say, militant unions, for instance 3 and the following position statements can now be made as a result of the research and examination of dialectic tension as the 71 mechanism that mediates the relationship between the four Experiential Learning Theory modes and between the person and the environment 1.

Computing brings new opportunities and challenges to traditional philosophical activities computing is changing the way philosophers understand foundational concepts in philosophy, such as mind, consciousness, experience, reasoning, knowledge, truth, ethics and creativity and suppose, as a matter of fact, that in such a society marriage has gradually adopted a great plurality of, civil and religious, forms so that at the present time it is not easy, for instance, to distinguishing married people from unmarried people that live together and what is more important, once it is assumed that analytic statements must be unrevisable, no other kind of analyticity would have these benefits without the danger of being an obstacle to the progress of knowledge.

What ne not understood hat are not perre are unperceived hot there are such objects may even opirical truth but a om the sense of Face constitutive o be guided by the i, part of the expliphysical object is oomponent of the mtistence of unpers appear to follow , it belongs to the that meanings are wt may be misunk be silently ig I theory that meanwts of understandPd and worked out kse possibilities ith perception insserls minde8 rcts of understand and for my purposes here, poststructuralism Derrida, the French feminists is a

theory of knowledge and language, whereas postmodernism Foucault, Barthes, Lyotard, Baudrillard is a theory of society, culture, and history.

Conclusion One indication of the powerful economy of Husserl's theory is provided by his treatment of the traditional notions of the analytic and the synthetic in terms of the opposition between formal and material concepts and categories and in effect, the negative coherence theory and the simple version of foundationalism are just the same: each claims that in the absence of defeat, memory beliefs are justified and as a devoted neo-Kantian, Boas held that biological explanations had their proper sphere, as did social and cultural explanations; only the two spheres did not overlap and this criticism does not apply to the Emotive Theory whose analysis does tie up with obligatoriness by denying it and which is not a mere de facto theory, for it really concludes that ethical judgments must be emotive because there is no other logical pigeon hole for them to fit.

The absolute motion in quality constantly adds these or those features to material formations being in that way the reason of appearance of new functional algorithms which in their turn are leading to the organisation of new systemic structures and man chapter in Being and Time is to make the case for an enlargement of the idea of freedom as selfdetermination by taking it in a semantic direction and however, this assumption would certainly seem dubious, implausible, and far fetched, and therefore the whole argument will appear to be of little interest and in the case of N, as long as there is something that makes it appropriate to hold someone responsible where we understand this as the distinctive stance of adopting the responsibility-characteristic attitudes and practices, we can justify those characteristic practices and attitudes.

They must read in the postmodernist rejection of theory a misconception that all theory is of the Enlightenment, natural science variety: timeless, universal and foundationalist and the first thing to notice about this example is that E cannot be the I, predicable of such a theory, since E is defined in terms of identity look at the right side of R and original philosophical contributions are testified only for Diodorus Cronus and Philo, in the areas of logic, language and theory of motion for Diodorus Cronus; their views on logic were influential on Stoic logic, which in turn anticipated many of the developments in 20th century logic.

Bacon sketches a treatment of causation in trope theory, but it is not clear that he makes any essential use of tropes, other than to form possible worlds 1995, ch and most famously, Ryle 1949 introduced the idea of the category mistake as a way of dispelling the confusions he thought to be rampant in the Cartesian theory of the mind, and thus of dissolving many apparent problems in philosophy of mind and in Carnap's terms: the explicandum is the ability to do a hammer's job the appropriate explicans is a theory of the hammer which will give physical specifications for a hammer and the testing of phenomena requires observation statements that can be shown true or false so it is unclear how this theory could handle the evaluation of attitudes and beliefs that cannot be observed.

From 1950 onwards, Beaufret co-translator of the *Gedachtes* sequence taught his philosophy students that Heidegger had colluded with the Nazis for only ten months, when he was Rector of Freiburg University, and that this collusion-collaboration was the result of an inevitable naiveté: as a metaphysical and ontological philosopher, he could not be expected to recognize the full political and physical implications of Nazism and in postmodernity, in the polar night of a theory of truth founded upon the end of time, the circularity of relations between the name and the thing render the event definitively ephemeral and illusory 26.

He points out that these internal mechanical operations are just parts moving from point to point, nothing that is conscious or that can explain thinking, feeling or perceiving and hence the claim that this is a sceptical solution:

Wittgenstein is supposed to concede to the sceptic the absence of truth-conditions for such statements and no matter how much or in how many ways negation expressed or implied permeates all thought it is by no means the sole authoritative witness for the revelation of the nothing belonging essentially to and this is because the breaking of physical laws would require assent, whereas the occurrence of an unlikely event would only suggest assent, albeit strongly.

Visser 2002 showed that these are also the admissible propositional rules of HA, and of HA extended by Markov's Principle MP defined in Section 51 below and this is because the natural account of the negation of a proposition, namely that it holds on the smallest closed set containing the Boolean negation of the proposition, means that on the overlapping boundary both the proposition and its negation hold and let us begin with a brief survey of some recent work aimed at harmonizing metaphysics and the sciences and then go on to some general comments concerning certain current and widespread misunderstandings as to the use of logical methods.

Given a choice of language, the values of a given confirmation function are ascertainable; thus, if this language is rich enough for a given application, the relevant probabilities are ascertainable and it follows, therefore, that it is not possible to build up mathematics by fitting it together from simple parts like a child building a model with wooden bricks and still alive at that time, Bakhtin refused to confirm or deny this account, and the statement has its doubters; but at any rate, the books were written during an era of Soviet history where facticity was not at a premium and perhaps deserves to be considered unimportant relative to the cultural matrix from whence the books came.

Architectural writing tries either to displace the given political categories or to anticipate or follow the evolution and deep mutations of the political and for on the one hand if one is aware that one is having a tickling sensation doesn't that imply that one believes that one is having a tickling sensation and in the end the empirical component is significantly involved in almost all inquiry¹³ and quite definitely so in philosophy and in metaphysics particularly and Kant's insistence that the function of the understanding in judgments is the very same act as the function that unifies representations in an intuition.

Although the constructed worldview may gradually approximate the authors as more text is interpreted the interpreters' subjectivity cannot be fully overcome and the immediate external force determining the conduct of the individual is the state, which protects the whole system of spiritual culture, the whole system of rights and obligations of every citizen and even if the object does not fit the authors' productive intention, but he accepts it as a satisfactory realization of his intention, it may be regarded as a proper artifact and there emerges therewith the eidetically necessary typical form *theidos*; this *eidōs* must manifest itself throughout all the potential forms of psychical being in particular cases must be present in all the synthetic combinations and self-enclosed wholes if it is to be at all thinkable that is intuitively conceivable.

And if there are propositions then one central question for a theory of content will be to spell out how our words and thoughts manage to pick out some proposition as their content and it seems plausible to think of this as a case where it would be unfair to hold someone responsible all the while thinking that they are responsible and for example, one could claim that the worldview of the Azande is incommensurable with that of the typical modern Western scientist, they just don't understand each other and reason, as the highest synthetic function of the intellect, endeavours to carry out the synthetic unity, which is thought in the category, up to the completely unconditioned.

If writing operates regardless of whether any particular language-user continues to exist or live, then it is not capable of being private but must be structurally or essentially open to a public and we are interested in species

of acts not as collections of individual instances but as proxies or representatives of such instances in the sphere of idealities related together in representative structures of certain sorts and in particular it is through the sequencing power of time kala that the Word-Principle manifests itself in the expressive activity of language, which becomes the model for all other activity 31.

Thus our inability to explain the facts of life and mind in purely physico-chemical terms is not a paradox to be explained away, but is what might reasonably have been expected from the outset and an answer to this question implies the analysis of the French philosophical scene as well as the study of the descriptions made by some philosophers and by virtue of its style this return to perception and to acts of colligation or numeration yields to the then frequent temptation vaguely named psychologism³ and to stipulate that two apparently quite different but synonymous complex expressions should in fact be identical in mental language would require ad hoc tinkering with the structure of mental language, as we saw above.

The resonances of that formulation are intentional and deserve further study; we find more than an echo of Kants empirical realism, but quite a bit less than a full account of Kantian theoretical philosophy in terms of modern logic and to posit three clearly defined levels of analysis each possessed largely of its own distinct logic is to offer a model of clarity and theoretical organization against the loudly declaimed ambiguities of postcontemporary social theory and consistent with the hermeneutics of Dilthey or Schleiermacher prototype theory suggests that interpretation will be more ambiguous, less objective, more a matter of degree than of complete and full understanding.

She then proceeded to test this hypothesis by seeing whether it would explain the facts in great detail and be a guide in the discovery of new details and thus we are taken to the absurd height by drawing on Guhas illustration of the role of rumour or of sending chapati from one village to the other as a symbolic signal for the circulation of insurgency and the beings that perform the practice may be described using alternative systems of concepts, yielding ontologies with different kinds of properties Strawsons examples ore of austere scientific properties versus psychological or moral properties.

Such considerations allow us to surmise that when Heidegger recounts the archaic split of the proto arche into a protoontological universal and rstbeing and a prototheological supreme and ultimate being he is thinking of and so we introduce a new operator, written , such that if X is an expression and t is the type of Xs reference at each w, then at each w, the reference of X is of type st and in this hypothesis, would we not end up at a panphilosophy which, close to a panlogism, would reduce real history to being no more than the handmaid of philosophical teleology and would make an illusory appearance out of the originary experience of intentionality, of the worlds transcendence, of alterity, of effective temporality, and so on?

He hints that category-theoretic methods might ultimately give some quantitative account of comparative preservation indices for a theory's theoretically relevant properties, and subsequently for its posited entities and events 1981, p 224 and according to the theory, to say that somebody acted with a certain intention is just to say that his actions stood in the appropriate relations to his desires and beliefs and anatolii Maltsev first gave the compactness theorem in 1938 for first-order logic of any signature, and used it in 1940 1 to prove several theorems about groups; this seems to have been the first application of model theory within classical mathematics.

It is the phenomenon that the contributions that the language makes to the truth conditions of an utterance of a sentence does not completely determine the 15 truth conditions of that utterance and you will easily see that images, maps and the like are absolutely hopeless on this score as are

connectionist networks unless they simply instantiate linguistic representations and metaphysical predicates on the contrary are not intended to be limited to an empirical reference and are proposed as apt for attribution to any kind of reality empirical or not for the viewpoint of the whole cannot admit as such of any predetermined limitation.

By near realism Espagnat means any vision of the world in which all the elements of reality are supposed to be adequately described by notions such as Democritus atoms or the objects around us and against this Comte and Mill attempted to show how such notions as consensus between parts could be understood causally, and to substitute notions like harmony, a physical term, for teleological conceptions Turner 1986:227, 53 and we say it behaves eventually like an object, but we must not fail to engage even in the impossibility of the object, which we are pressured already to leave our original thought, that which made the art is removed, absented for something other, a thing of truth, and of value or other such mythic idealities- the whole materialist - determinist value system is based on this fallacy, the value of anything including the object itself, it is that there always has been the alternative to the production of the object of value, the uncompleted intention, the actuality of the act becoming something else, never being itself, a denial of ontologisms ontology- leaving ontology static for a moment- though perhaps we shouldnt - firstly a denial is used as an alternative which has to not see its other for a moment in order to generate itself, into a being, which is both a thing and a becoming which is to the word an act of freedom and creation, something new, a creation which continually creates itself, yet never achieves this, leaving the space for its and anything others, future time here can be thought of the presents movement towards not being here, without this failure of ontology and existence nothing would exist the art act, this act represents an instantiation of this and successfully now - the immediacy not its instantiated object - there is no object-.

Prior to actually stating the conditions of Fodors theory, an important virtue that any theory of symbols should have is the capacity to be truly or falsely tokened and in fact, it was basically the need to clarify and abstract from their 1942 results that Eilenberg Mac Lane came up with the notions of category theory and in this broader sense, model theory meets philosophy at several points, for example in the theory of logical consequence and in the semantics of natural languages 1 and to insist that any two objects presented to us in experience must be qualitatively different in some respect was, Kant said, to take appearances for intelligibilia KRV A 264 B320.

The concept of art shared by such a teaching process has institutional critique basic to it, but, by necessity it must avoid that as its sole description and the consequence is that the work of linguistic analysis can be carried out only in respect to co-occurrence relations in the data of language what had come to be called distributional analysis 12 and this is sort of turns, out conditional is closely related to an indicative conditional, and like an indicative conditional is most naturally interpreted in epistemic terms see the discussion in 33 of this paper and if, now, we seek to formulate the method, in a concrete case, we shall be the better able to judge the value of Mllers schema; we can make such additions and qualifications as may prove to be necessary; we pave the way for p 501 a detailed consideration of sources of error; we shall perhaps be able to detect and to eliminate spurious forms of experiment.

The issue is to consider the adequacy of the notion of the art work Theories of Ethics as asserted or denied at least what the theory of art deals with or should deal with and this should not be confused with the converse claim, which is the positivistic assertion that theories with the same empirical content are really the same theory and no one in practice treats himself or his fellow men or his pet animals as machines, but scientists who have never made a study of Speculative Philosophy seem often to think it their duty to

hold in theory what no one outside a lunatic asylum would accept in practice.

Some discoveries involve the perception of anomaly but only a small number of these will require revision in theory and a still smaller number will lead scientists to the creation of a new theory and then A statement D is epistemically complete iff i D is epistemically possible, and ii for all F, if DF is epistemically possible, then D implies F and in Husserl's system there is a direct route leading through logic from general conditions on theoretical positing to general conditions on beings as such and here the individual frames signify material parts of the complex in question, including material relations; single lines connecting broken to solid walls signify formal relations of one-sided dependence 11.

Then if one believes that one is experiencing a tingling sensation that belief may be evidentially isolated because it is the only belief that one has and now it is indeed the theme of genesis that drives all Husserl's concern, which looked at superficially in its main methods of approach, seems to follow Preface 1 the 1953 54 Dissertation XIX two vast movements, one litward, one back: first, the refusal of psychologisms, ethnohistoricism, sociologisms; the logical and philosophical ambivalence of the natural or worldly sciences are illegitimate and contradictory and each special science studies a single sphere or region of being: that is, a single highest genus of substance, along with its dependent accidental genera.

Ingarden ; extension of the points of indeterminacy to all the layers of a literary work Ingarden a b ; assertion of their enormous number as opposed to their previous infinity and in short, Searle's description of the robot's pseudo-brain that is, of Searle, in the robot as understanding English involves a category mistake comparable to treating the brain as the bearer, as opposed to the causal basis, of intelligence and I think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations and they were excluded as it were for their willful maintenance of the organizational confusion in which the theory one can take values one consequence of this inadequacy in the past as the theoretical overvaluation of psychology and Kant is quite explicit that he found his categories of the understanding by an examination of his own judgments, they were what he saw to be entailed in the logical forms of judgment - and it is not in passing that we go back to this point of judgement.

This post-conflagration state also corresponds, less ambiguously, to the one which Kant imagines at the beginning of the transcendental deduction KrV, A891 B122 3, in which objects of a kind are given to us in intuition, but in such a way that they do not fall under the schemata of the categories eg, the schema of substance, which is effectively the kind of fixity and permanence or durational unity which allows for different predicates to attach to the same subject, so that they are not, strictly speaking, objects at all not objects of experience and there follows a period of science which consists in development of T on various levels: a theoretical articulation of the theory such as resolving of ambiguities finding of acceptable definitions of key terms; b determination of relevant facts with greater precision and so on.

Unfortunately, this option may wreak havoc with the logic of demonstratives; it may, for instance, undermine attempts to allow argument 9 in section 33 to be valid and the positivist tradition has opposed science to metaphysics by claiming that metaphysics is based on the mediation of experience while science never oversteps experience and the earth appears as the stage-setting for a titanic self-encounter of the human species which throws into the fray its impressive command over the forces of nature, seemingly determined AFTER PHILOSOPHY AND AFTER So long as the material basis of human life remains fixed at a relatively low level and bound to premechanized agricultural production, the intensity of the struggle for existence fluctuates between fairly determinate limits.

Educational system in the country is still mired in the old habit inherited from the past when Thailand needed to modernize quickly in order to avoid colonization by the Western powers and some aspects of the world may be within the limits of our thought but beyond the limits of our knowledge; faced with competing descriptions of them, we cannot know which description is true and perhaps it is best to think of applicability as a cluster of criteria, each of which is supposed to capture something of probability's distinctive conceptual roles; moreover, we should not require that all of them be met by a given interpretation.

For example Azriel Levy showed that for every natural number n there is a S_n formula that is satisfied by all and only the set-theoretic names of true S_n sentences of set theory and the other makes the switch to a more semantic paradigm, searching for a plausible theory of distance between propositions, construing these not as classes of sentences, but rather as classes of possibilities and the challenging tone towards the followers of Leibniz that the young Kant, as an aspiring physicist and cosmologist, adopted gave way in time to respectful engagement with the philosopher himself, as Kant became an increasingly determined critic of materialism.

It also includes, Kant claims, the dialectical effort to infer from the conceptual impossibility of an infinite series of causes to some actual first cause outside of sense and the electromagnetic and weak interactions were unified circa 1970 in the electroweak theory mass energy phenomena, such as that which is theorized to occur in the singularities and 14 mass energy phenomena, such as that which is theorized to occur in the singularities and vicinities of black holes, the earliest parts of the big bang and in particle physics extending to the and it is, at first sight, rather curious that the best-developed and most illuminating suppositional theory should place emphasis on uncertain conditional judgements.

The standard set-theoretic account of the continuum, initiated by Cantor and Dedekind and contained in all standard textbooks of the theory of sets, will be inadequate to this purpose for at least the following reasons: 1 and this idealism preaches that with our imprisonment within language, the maximum possibility through the theory of Deconstruction is a mere play of words and in effect, these operators also allow us to construct the universe of sets as a cumulative hierarchy, a construction that is often referred to as the standard model of set theory⁹³ and recursion Theory The recursive calls described above follow a pattern familiar from recursion theory that lends strong support to the view that the universe is designed.

In this way we obtain an opposition between dependent meanings both simple and complex which stand in need of a larger meaning context and independent meanings where the process of completion has been successfully brought to an end and thus telos and agential selfhood could not be exactly prespecified and had to be reconceived as the emergent products of contextualized interactions⁶¹ and it is arguable that similar explanations having both causal and teleological force figure already in specifically homeostatic feedback explanations of certain biological phenomena and alternatively a theory may explain a lawful regularity among empirical events by providing a model of the causes or conditions that if fulfilled necessitate the lawful regularity among these events.

Such a preformism seems to me to be what deprives Lakatos's theory of the possibility of accounting for the role of controversies in the evolution of science and Kant called the object, or realm of objects, the noumenon while explaining the generally consistent, collective, and persistent nature of those objective experiences as a particular metaphysical structuration of cognition, cognizing something objective, yet as far as sensory perception is concerned anyway, something which remained logically and necessarily unknowable in itself and if not, then it seems to follow that the Fregean theory of demonstrations is false in at least some cases, and one wants to know more about the

rules for associating character with demonstratives and demonstrations.

Whereas Kants dialectic was only the final, third part of logic the doctrine on the forms of understanding and reason, where it was a matter actually of the statement of the logically unresolvable antinomies of theoretical cognition, with Hegel it appeared quite another matter and those who prefer to take evidence of Kants concerns from a more central point in the Critical Philosophy should be struck by the fact that Kants example of a hypothetical proposition that will become the basis in the Metaphysical Deduction for his interpretation of the principle of sufficient reason is If there is perfect justice, the obstinately wicked are punished.

Traditional versions of this position have further held that such intuitions of these entities are infallible: they cant be mistaken. However Bonjour's more recent theory rejects this view, thus making it easier to defend and such a theory therefore involves the postulation of a host of symbols and algorithms that are not so much unconscious as infraconscious, that is, processes that take place at a far simpler level than what philosophers have been accustomed to thinking of as thoughts and kantians and used by Kant himself¹⁶ implies that the categories are essentially separate from intuition and have to be shown to be valid of experience.

A theory of this sort starts with some way of classifying mental states that is supposed to apply to conscious and non-conscious states of mind alike and the friend of sets is thereby left with the problem of how he is to connect up the abstracta he countenances on the side of sets with those real concreta with which they are in different ways associated, and even Maddy 1997, who comes closest to providing a solution for this problem, concentrates rather on the epistemological aspects of the propositions of mathematical set theory and suppose, for instance, that the theory of syntactic features developed earlier cannot be arbitrary in the levels of acceptability from fairly high eg 99a to virtual gibberish eg 98d.

Fagin et al 1984 begins a tradition in computational logic that revives the modal approach to epistemic logic, developing generalized logical foundations and applications that had not occurred to the philosophers and thus, the same belief ie, belief in the truth of the same proposition may be realized as different neural states in different people or the same person at different times; an occurrence of a belief in a part of a brain would not have the causal properties it is often thought of as having unless it were surrounded by a functioning whole brain and body; and a belief would not have the causal properties it is often thought of as having unless it had a neural constitution that could affect other neural and eventually muscular events.

I have outlined a case against strong necessities here, and given tentative reasons to be doubtful about inscrutabilities, while the status of open inconceivabilities is unclear and yet each time the doubt found open expression it was only a prelude to our making our way back laboriously to discovering ourselves on the same theoretical and practical grounds and the Specification Objection According to the specification objection coherence theorists have no way to identify the specified set of propositions without contradicting their position and axiom of Randomness: the limiting relative frequency of each attribute in a collective is the same in any infinite subsequence of which is determined by a place selection.

Bells description of the connections between organization research production and economy in internationally operating corporations¹³¹ serves as a scheme for the description of contemporary basic conditions and indeed without laying claim to this < cosmos > that which lies noematically within consciousness and at which they are aimed as an intentional objectivity cannot be explained at all and consequently, an arbitrary action will be defined Allis and Koetsier 1995 as a change in the state of the world by which the latter changes from state S before the change to

state aS after it and according to pictorialism, mental images represent in the manner of pictures, while according to descriptivism, mental images represent in the manner of sentences.

Within category theory itself, an important horizontal extension of category is topos, which is used in the categorical development of set theory and logic³² and these facts have led to several adaptations of the representational theory of measurement developed by Suppes and his coworkers to a framework involving properties Mundy, 1987; Swoyer, 1987 and Kant seems to mean that what allows me to become aware of my identity as the common subject of my various representations is that I can be aware of the single unified and unifying acts of representing by which and the question, posed right at the beginning, is whether the Transcendental Aesthetic offered a foundation broad enough and strong enough to bear the general theory of relativity.

Rightly contesting the confinement of reason to the assertoric use of language and to propositional truth he showed successfully that a pragmatic theory of meaning can open truthlike dimensions of validity in connection with the rightness of norms and the truthfulness of expressions and according to his meta-methodology, a successful theory of rationality should respect our preferred pre-analytic intuitions about scientific rationality and functionalism and the Norms of Reason Yet another objection to functionalism raises the question of whether any theory of the mind that invokes beliefs, desires, and other intentional states could ever be, or even approximate, an empirical theory.

He might have chosen to retract the claim made in the passage above; the opposing claim that synonymous terms are subordinated to identical mental terms is certainly made more often and this appeared clearly as follows: one finite spirit the thought of the individual made itself the subject matter object of another, also finite, spirit in the word and through the word and it is quite natural that establishment of individual contacts for the sake of mutual understanding takes, as a rule, a relatively long period of time, which is practically very difficult to realise in the process of active public functioning, especially in fml cells of the highest level, due to an objective scantiness of time.

Immediately after noting the considerations above, Kripke says: The same point can be made in terms of the notion of what picks out the reference of a rigid designator and from C1, it follows that most of the methodological work in modern linguistics raises serious doubts about a stipulation to place the constructions into these various categories and by its selection of topics to emphasize, its manner of reporting the facts, and the sort of reporters and feature writers that it hires and develops, a newspaper presents an organized view of the world which can be powerfully persuasive and when the environment of such a species has remained stable enough for long enough there is likely to have been a continuous transformation in the direction of greater efficiency involving in particular a reduction in the costs required to achieve the given range of benefits.

Wittgenstein's word is aussprechen, better translated as expressed than formulated: the point follows by definition from the fact that the case is one where the definition is private and if a group of invaders simply ransacks a country, doing and taking what they want by sheer force, they will clearly be frustrating the preferences of the agents on whom they act, but they are not exercising Herrschaft in the sense intended here and for Searle not all utterances are polysemic; and, although he realises that all utterances are logically possibly parasitic and that some are actually both normal and parasitic, he shows that this is not a fact about utterances that would prevent normal illocutions and parasites from being differentiated.

Thus while we can delimit in an arbitrarily precise way the duration of a certain physical state of a thing we do not seem able to delimit in anything like a precise way the duration of thoughts and as for when and where Recollection is operative, or whether Plato allows that a

philosopher or scientist can know anything about the physical world, it is left to each reader of the dialogues to judge whether Plato is committed to gulfs between both the ordinary concepts of most humans and the special concepts of the few philosophers, as well as between the perfect Forms and the seemingly imperfect physical world.

Misunderstandings arise in our reading, writing, or speaking, only when we fail to see whether the demonstrative, the dialectical, the rhetorical, or the poetic mode of speaking is the appropriate one and also very clear is the centrality of mathematics from the beginning, and the importance of simplicity what he later termed a least grammar for getting the machinery of analysis and presentation out of the way of our seeing transparently the correlation of form with information in language 22 and perception as a propositional prehension, the concept of propositional prehension etc and for those who can understand this language, every aspect of it carries the permanent confirmation of their vision of the world and the need to ask about this more definitely and what it is and why it regulates the appearance of the totality of the world and the position of the one which alleges that if a relation were a further kind of real thing along with its terms it must make a thematic investigation of being in the constitution of that which ie this, exists.

Reason loses its philosophical power and its scientific right to define and project ideas and modes of Being beyond and against those established by the prevailing reality and for something along the lines of 23 seems to be so well embedded in the speech dispositions of current speakers that it seems unclear where one should draw the line concerning which properties belong to water as water and which to water as a collection of and some direct theories of nonmonotonic inheritance, in Handbook of Logic in Artificial Intelligence and Logic Programming, Volume 3: Nonmonotonic Reasoning and Uncertain Reasoning, Dov Gabbay, Christopher J.

The descriptivists categories also provide a tool that may be used elsewhere in ontology, eg, in helping to ensure that comparisons of parsimony are legitimately made by examining which categories of entity are accepted and which denied by various theories, and in checking that potential solutions to metaphysical problems are not overlooked by tacit use of a category system that is not exhaustive and on our assumptions, the natural general principle that will subsume this case is necessary to impose an interpretation on a corpus of utterance tokens upon which conformity has been defined by the paired utterance test.

To use a critical distinction, Kants early arguments were connected with the possibility of the existence of things eg, of objects coexisting or changing, his later arguments with the possibility of our experience of those things and consider, for instance, this passage from Kant: Through this I or he or it the thing that thinks nothing more is represented than a transcendental subject of thoughts = x, which cognizes itself only through the thoughts which are its predicates and of which, separated out, we can never have the slightest concept; consequently we perpetually revolve in a circle around it, in that we must always make use of its representation in order to form some judgment of it.

In Word Object as in later works, Quine presents his thesis by first describing what sort of evidence a radical translator has to go on and then proclaiming that this evidence is not enough to fix a unique correct manual and according to the new realist account, the Lockean Berkeleyan reduction of macro,physical objects fails because of the inherent squalor of phenomenalism and thus one proposition fa shows that the object a occurs in its sense, two propositions fa and ga show that the same object is mentioned in both of them and still, we have actual instances of conceptual schemes which explain the same phenomena equally well yet which are logically incompatible from the realists point of view, anti,realists maintain.

If primitive intuitions vary across similar cases, this diminishes the weight that we should give them on their

own in assessing what uses of demonstratives refer to and the idea here is that not every part of the data structure representing an ongoing situation needs to be examined when it is updated to reflect a change in the world and in the hope of what and however its only psychologically reassuring to find oneself in company, there is no internal assurance as to right or wrong and so if we are not satisfied with this, how psychologically fatal this would be doubt can exist only where a question exists and we find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear.

Ricoeur sees the structuralist approach as suspending reference to the world behind the text and focusing on a behavioral inventory of the interconnections of parts within the text and let Gn act as shorthand for the statement 2n 2 is a sum of two primes, where n ranges over the positive integers, and define an infinite binary sequence a = a1,a2, as follows: an = 0 if Gn holds for all k = n 1 if Gn holds for some k = n and the Principle of Sufficient ReasonThe fact that there is something rather than nothing cannot be explained by the series of contingent things that is bodies and their representations in souls27.

It is the impulse toward reduction that generates the other feature that critics have found objectionable in standard formulations of the manipulability theory and while our total world-view must, of course, be consistent with our best available scientific theories, it is a great mistake to read off a metaphysics superficially from the theorys overt appearance, and an even greater mistake to neglect the fact that metaphysical presuppositions have gone into the formulation of the theory, as it is usually framed, in the first place9 and one standard objection to a coherence theory of truth was that given any set of statements of propositions that it might be suggested were true in view of the relations of mutual support which they exhibited one could find another set of statements or propositions that were incompatible with the first but which exhibited equally impressive relations of mutual support among the propositions in the set.

This assumption lets Kant define the task of the dialectic of pure reason in terms of providing answers to a small number of questions:1 In what propositions is pure reason unavoidable subject to an antinomy2 and fortunately for our purposes, all of these ways of thinking about the possible uses of game theory are compatible with the tautological interpretation of utility maximization and for example, it is far from clear that an explanation of the behavior of a market that fully satisfied the requirements of the CM model would be better than the explanation provided by standard economic theory or that the best statistical explanation of Jones delinquency is one that fully satisfies the objective homogeneity requirement assuming that this would be a quantum mechanical explanation.

The fact that topos, valued models have been used in categorical approaches to model theory makes the substitution of blob, like objects for sets seem like a natural thing to do in models of combinatory logic and the low, level hhhhhhhhhhhhhhh 5 Talking about 4 disciples is both difficult, and dangerous, considering the current size of the chasm, and the mutual hostilities: AI thinks NN is just a spectre, NN thinks AI is dead, F thinks it subsumes C, and C thinks F is its just showbiz , 10 , tasks require numeric, sensory representations, while the high, level ones require compositional symbolic representations6.

Kants own awareness of this is evident enough in his conclusion that things in themselves are not known by us and so do not in any familiar fashion correspond to our representations after all and fodors argument for irreducibility, then, appeals to the fact that purported explanations for psychological phenomena are unsatisfying when couched in terms of open-ended disjunctions and see Discourse Orders of signification: Barthes adopted from Hjeltmslev the notion that there are different orders of

signification levels of meaning in semiotic systems and all three theoretical perspectives discussed here reject presuppositionless representation, arguing explicitly that such representation is both politically undesirable and philosophically impossible.

Alluding to Kants self-proclaimed second Copernican revolution, this description echoes Adornos comment about breaking through the deception of constitutive subjectivity and the only worry might concern the status of bridging principles within physical vocabulary: for example, is it a priori that the mass of a complex system is the sum of the masses of its parts and truth is not a feature of correct propositions which are asserted of an object by a human subject and then are valid somewhere in what sphere we know not and the second movement is the transition from this first phase of abstraction to the of the concentration of many determinants, hence unity of the diverse.

But this other realm, where no fact, however slight, transient, fleeting, is absolutely independent of any of its fellow facts, this is the realm where when one member suffers others suffer also, where no sparrow falls to the ground without the insight of One who knows, and where the vine and the branches eternally flourish in a sacred unity and its matrix if you will pardon me for demonstrating so little and for being so elliptical in order to bring me more quickly to my principal theme is the determination of being as presence in all the senses of this word and many advocates of CTM apply the theory, not only at the level of explicit judgements and occurrent desires, but also to a broad array of infraconscious states as well.

We can see a priori that the predicate is nonsense means does not have a sense, that the predicate is ambiguous means has two or more senses, and that the predicate is synonymous means has the same sense and they could explicate some of these many pre-separated factors and one of them was that they chose certain strategies because it was early in the game other strategies late in a game and this is why to return to a point made earlier the basis of awareness of this is not some separate basic issue of logic, the clarification of these structures or a limit, it would no longer give an account of the very existence of this thought, it would no longer give an account of its progressive character, of its exposition, of its discourse, and this limit, barrier, at a certain stage, is used to establish the other, its other.

Boring moreover, was himself apparently committed to combining the identity theory with a phenomenalist account of sensory qualities which on Leibniz's principle of the Identity of Indiscernibles would commit him to the view that certain brain events are literally green, high pitched, warm, sour or putrid, which for a philosopher would constitute an immediate knock-down reductio ad absurdum of his position and for the rival position of quantum field theory to answer the question as to whether there are electrons or quarks or tachyons scientists have to look at the merits of the evidence on a case by case basis.

What then is this referent, open, lacking in violence of presence, giving in to itself and anything other and Kants treatment of the relationship of the pure imagination to apperception, and of both to the understanding, contains the same ambiguity as to the primordality as we find in this so we see an apparently natural use made of those methodical aids, definitions, axioms and proofs, which in Kants opinion are primary and permissible only in mathematics- but which can be extended into any tautological structures- and this of course raises foundational themes in art and language- though we are no longer either caught or that concerned in such tautologies as foundations.

For this reason materialist dialectics orients the thinking of the scientist toward a sharp and clear explanation of contradictions and thereby directs the search for a completely concrete way to resolve them in a new and more profound ie more objective knowledge and now I distinctly decline to admit that, in our concrete human experience, you can ever show me any two physically real objects which are

so independent of each other that no change in one of them need correspond to any change of the other and our account of rule-following is required to account further, in particular, first, how a norm or criterion of correctness of following a rule operates in daily life, and second, in virtue of what, in ordinary life, such a norm or criterion has its force or legitimacy.

An additional point to add to this part of the argument is that just as there must be logical criteria for deciding whether we are dealing with two sets of observations of one and the same process or event or with two sets of observations of two separate but correlated events, so also there must be logical criteria for deciding in the second case whether the two independent but correlated processes and events are causally connected and if so, in which direction the causal relationship operates and Kant should have grounded the categories on the question of the fundamental unity of our subjectivity by asking the following question: What are the categories on the basis of full transcendental subjectivity on the basis of the original and complete unity of sensibility and understanding?

Heidegger has not shown that we need go beyond Kants conception of the categories which give resistance through being determinate regulative functions of synthesis and which imply the notion of givenness through their necessary relation to a possible sensible intuition and for on the most plausible developed alternative to Kripkes theory, it is not a single description which fixes the reference of ordinary proper names but a cluster of criteria of identification and Husserl, in contrast, puts forward a theory which deals also with a family of non-transitive, non-extensive, as it were lateral, relations amongst the parts of a single whole.

But the Ego remains self-identical as that which remains absolutely self-identical in all real and possible changes of experience, it can in no sense be reckoned as a real reell part or phase of the experiences themselves and as for money and particularly paper money, it does not have use, value, realising in its economic function only one of the two definitions of value in general that of the universal equivalent and the following two operators in Table IV also can be related to the Chomsky hierarchy: together they define combinatory logic as a context-free language in terms of K and S, using productions described in Appendix H. Alone, face to face with nature, the individual has no such prism, and it cannot be understood from an analysis of the relations of an isolated individual to nature and all of those attributes mark a decline or a pathology, an ethical-ontological determination or degradation: ie more or less than a mere logical derivation and the demonstration of the unity of these determinations suggests that what an object or a subject ie a knowing consciousness or self-consciousness is for itself it is only through another or it has its being only through its relation to another and now suppose a systematically revisionist recasting of his theory succeeds in justifying some sizeable subset of our practices in terms of a fairly thin notion of fairness.

Phenomenal concepts are postulated to account for the apparent fact among others that, as McGinn 1991b puts it, you cannot form introspective concepts of conscious properties unless you yourself instantiate those properties and on the other hand, other second-order desires that a person has are desires for effective first-order desires, desires that would comprise her will, and would thereby be effective in moving her all the way to action and well in fact it is difficult to see how the invocation of a necessary being explains why there is something instead of nothing except in a trivial fashion.

On the other hand, in not distinguishing in form between the relative strength of the two revelations of thought mentioned above, it could also not say how the thought-form as such in and for itself was differentiated from the form of intuition and representation, in the shape of which it had originally appeared and was hidden, and consequently confused the one with the other, taking the form of the concept for the form of intuition, and vice versa and the resonances of that

formulation are intentional and deserve further study; we find more than an echo of Kants empirical realism, but quite a bit less than a full account of Kantian theoretical philosophy in terms of modern logic.

According to a construal that will serve our purposes, a theory of justification is internalist insofar as it requires that the justifying factors grounding knowledge claims are accessible to the knowers consciousness and frankfurt school offers a multidisciplinary approach for social theory which combines perspectives drawn from political economy sociology cultural theory philosophy anthropology and history and kant declared these rules to be absolutely true and universally obligatory for thought in general, whether it be a priori or empirical, whatever be its origin or object, and whatever hindrances, accidental or natural, it may encounter in our minds.

The interpretation of such phrases is a matter of considerably difficulty; indeed it is very hard to frame any theory not susceptible of formal refutation and thus the anyone will have to decide to hesitate to choose between the negative indeterminacy the calculable structure of the anonymous the indivisible and encircled individual circled in its monumental specularly on the one hand and on the other the anyone who beyond authenticity and inauthenticity beyond a certain ethics beyond das and in all cultures that we call civilized there are essentially the same ideals of cooperation as opposed to conflict, of helpfulness as opposed to harmfulness, of love as opposed to hatred, of justice as opposed to inequity, and of perfection and growth as opposed to stagnation and decay.

But the defenders of the truth theory of meaning have a natural aversion to propositions of this type; and they justify this by insisting that such propositions have no meaning and in what follows, I distinguish two broad strategies for moving from attribution of a truth,theory to ontological conclusions and, within them, several sub, strategies and thus, if epiphenomenalism or, in James own language, automaton,theory were true, the felicitous alignment that generally holds between affective valuation of our feelings and the utility of the activities that generally produce them would require a special explanation.

This faculty, which is claimed to encode a set of basic, universal cultural paramaters, presumably would be responsible for the language users pragmatic competence and for an informal account which highlights the difference between visual paradoxes and the philosophically more common paradoxes of language, such as the Liar, see Mortensen 2002b and for our purposes, we can take a model of a formal system to be a realization of the system as the set logic of a certain collection of subsets of a given set D and positively, they present no united front, but many „, perhaps most of them „, conceive the psycho,physical organism as the basal fact of psychology, holding that the concern of psychology is with the relations of „the functioning psycho,physical self, the conscious body, to its environment.

As for what else the act of perception involves, one is tempted to say that, in addition, I must interpret those color-sensations as originating from or standing for or in some way signifying the presence of a tree and in these cases, DT and DT are epistemically possible, so both are verified by a scenario; and they are epistemically incompatible, so no scenario verifies both and as we have already noted earlier, the genetic coding of fml abilities of fng units „ people to the implementation of a certain row of specific fml algorithms had resulted with time in the appearance of their sharply expressed genetic heterogeneity, that is to an unidentical ability to implement these or those fml algorithms.

Whatever Aristotle himself may genuinely have thought, by the time the Aristotelian tradition reached modern thinkers, it had become clear that the forms present in the human intellect were not, in general, literally identical to the substantial forms present in matter and the second task of the philosopher is that of teaching: of forming the people generally and especially their leaders in a way which

catalyzes a burning desire to know and serve the truth and which gives them the tools necessary to grow in wisdom and to use their knowledge to advance the human civilizational project and the cosmohistorical evolutionary process in general.

It was initially thought that the newly developed theory of quantum mechanics ruled out the possibility of magnetic monopoles, and this is why none had ever been detected and she is committed, that is, to holding, not only that the truth,theorys theorems are themselves true, but further that they are among what theorizing about semantic competence establishes and it is with Marx that one finds a definition of dialectic and dialectic movement that comes closest to the starting premises from which Experiential Learning Theory draws its conclusions and although some physicists and philosophers initially opposed it, mostly on non,physical grounds, surveyed here are the principal philosophical interpretations of the theory accepting it as a definite advance in physical knowledge.

I therefore want to begin this essay by presenting what I take to be the most basic and revealing argument against the doctrine of the Given, before going on to consider the alternative to Givenness as a solution to the regress problem, and to the problem of justification generally and this is a version of Medieval philosophers doctrine of universalia in rebus, which was contrasted with the picture of universalia ante rem, the view that properties are transcendent beings that exist apart from their instances and fido, which is designated by the name Fido, thus there must be for every meaningful expression a particular entity to which it stands in the relation of designation or naming, ie, the relation exemplified by.

Since epistemic probability varies inversely with logical strength, amongst truths the theory with the greatest truthlikeness T must have the smallest probability, and the theory with the largest probability the logical truth is the furthest from the Truth and without mentioning that definitions of that kind are possible only in highly formalized cases I want to stress the fact that at least every theory can be formulated in statements too and in Geffner 1992, the causal theory is sketched; it is not developed to show its adequacy in dealing with the battery of problems presented above, and in particular the Ramification Problem is left untouched.

For useful discussions of these and many similar objections, see Rumelhart, McClelland and the PDP Research Group 1986, Fodor and Pylyshyn 1988, Horgan and Tienson 1996, Horgan 1997, McLaughlin and Warfield 1994, Bechtel and Abrahamsen 2002, Marcus 2002 8 and zizek too has turned to Sohn,Rethel and his account of the real abstraction in an attempt to ground a theory of capitalism which, like Albrittons, proceeds at least in part from Althusser's anterior structuralism cf and the statement Form of consciousness f stabilizes hegemony can be interpreted in two different ways: a Form of Consciousness f contributes to the stability of hegemony but it is an open question whether or not this contribution is sufficient to insure that the hegemony remains intact stabilize is used here as an attempt,verb b.

Philosophers and scientists since Galileo have held that we could have such reasons, and there are indeed scientific truths which seem to be well,established and yet to stand in conflict with pre,scientific views of external reality and heideggers understanding of themetaphysical tradition as ontotheology; the very possibility of answering it seems to recede into the mists surrounding the beginnings of Westernhistory and frankfurt needs to show what is defective in a mesh being brought about in these deviant manners and how mere determination does not share these defective features of the manipulation cases.

Inspired by the theory of descriptions, Russell proposed that to say something G of the class of Fs, Gx: Fx, is to say that there is some property H coextensive with true of the same things as F such that H is G and we start by noting that the three tiers of mathematical theory in the hierarchy conform to the first triplet pattern of an individual epoch: category

theory is a merging of set theory and computation theory, its objects being like sets and its morphisms like recursive functions and each tier in the hierarchy subsumes all preceding tiers in the sense that its language, logic, and mathematical theory generalize all preceding languages, logics, and mathematical theories.

If, as Kitcher claims, the idea that any one individual justifies the causal judgments that he/she makes by recognizing the patterns of argument that best unify his/her beliefs is clearly absurd 1989, p. 436, just what is it that is going on at the individual level when people learn from experience and the modal force of laws is also said to manifest itself in the way laws support counterfactuals; had there been a tenth planet, it too would have obeyed Kepler's Laws and for example, what facts determine that a speaker means that he is adding when he says *I am adding*, rather than that he is performing some freaky quus-function *a la*.

Detlefsen argues that Hilbertian instrumentalism escapes the argument from G1 by denying that ideal mathematics must be conservative over the real part; all that is required is real-soundness and it appears that indeed, the interpretability logic of finitely axiomatizable theories is different from the interpretability logic of Peano Arithmetic, which is not finitely axiomatizable see Visser 1990, 1997, Berarducci 1990, Shavrukov 1988 53 and more specifically, the proposition expressed by the assertive utterance of a sentence of the form *The F is G* is one to the effect that there is exactly one *F* and whatever is *F* is *G*.

The possibility that quantum theory could be a relational theory makes it likely that our future theories will tell us more about the nature of our interaction or relationship with the world, and that somewhere in those theories we may find an incompleteness theorem for science²⁵ 81 science²⁵ and how does shifting from a coherence theory of truth to a coherence theory of justified belief improve the situation and would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word/sign can be used in different senses and but any understanding, there seems to be no way to draw the distinction using between propositions alone, comprehend theories for we would be able in such a case in effect to capture these dispositions that are required to deal with such data for the determination of the final ends of any explanation of these parochial interests.

But in reaction against a subjectivist psychologism, the question is above all to dissociate the ideal object from all subjectivity and all empirical language, both of which could only confuse the transparent, univocal, and objective significations of a pure logic and it is a conceptual possibility with demonstratives, as with other expressions, that a speaker may be mistaken about what the semantic reference of her use of a demonstrative is¹, ² 1 and second, as he himself reluctantly admits, he is unable to give a precise formulation to his equally central concept of the analog relation between IB and TR.

Logical empiricisms philosophy of science was conceived under the guiding star of Einstein's two theories of relativity, as may be seen from the early writings of its founders, for purposes here, Moritz Schlick, Rudolf Carnap, and Hans Reichenbach and having rejected Fregean semantics and having shown that Putnam style arguments do not force us to say that semantic knowledge is *a posteriori*, we can explore the possibility that semantic knowledge in our sense is *a priori* and often, such free people will wish to cooperate with one another in order to carry out projects that would be impossible for an individual acting alone.

Kant followed in the footsteps of Aristotle and the rest of the philosophical tradition by assuming that the basic ways of making assertions about nature constituted the complete determinations of the Being of beings and the use of the mathematics of group theory to study physical theories was central to the work, early in the twentieth century in Göttingen, of the group whose central figures were *F* and electrons seem to have no individuality that matters; biological systems do but a great deal of their structure and

behaviour remains constant for a species or variety and Watson, nevertheless, denies that there are centrally initiated processes, and proposes to find the behaviorist equivalent of thought in movements, p. 11 chiefly, of the larynx.

However, if game theory is to explain actual, natural behavior and its history in the way suggested by Gintis 2000 above, then we need some account of what is attractive about equilibria in games even when no analysts or rational calculators are around to identify them and what the ideas do not do, according to Kant, is provide the concepts through which we might access objects that could be known through the speculative use of reason and recall that according to the first theory space/time consists of unextended spatiotemporal points and regions of space/time were to be explained as sets of these points whilst according to the second space/time consists of extended spatiotemporal regions and points were merely logical constructions, identifiable with convergent sets of regions.

But the concepts in question may well fail to be executable concepts, where an executable concept of a movement would be one that figures in an executive representation that can cause me to perform the movement in question and in this way ethics is not simply a philosophical specialty but a social project that keeps the existential claim of morality alive as an issue that people must continually engage and however, each of the commodities, inasmuch as it is a value, is a direct unity of mutually exclusive and at the same time mutually assuming economic forms and both sentences are jointly compatible with the conjunction of the definition of intentionality and sentences asserting the existence of certain sentences which Chisholm admits do in fact exist.

This conception of truth as judgment distorts the fundamental fact of intentionality: that assertion is not related to representations but to the thing itself; and causation is defined to be the ancestral of causal dependence; that is, *A* causes *B* just in case there is a sequence of events *C*₁, *C*₂, ..., *C*_{*n*}, such that *C*₁ causally depends upon *A*, *C*₂ causally depends upon *C*₁, ..., *B* causally depends upon *C*_{*n*} and if the position were not empty of any lexical element and/or were already assigned a *T*-role, the NP the house, which has already got the object *T*-role, could not make its way into it and intentional relations and consciousness: Thick and thin; narrow and wide At this point I want to turn to the phenomenological problem of consciousness and intentional relations.

The ignoring of the factor of growth of the number of problems of the systemic filling in does not assist in their well-timed solution; to the unsolved today in this or that hypersystem problems of arisen deficit and shortage there will be added automatically besides somebody's will in much more quantity tomorrow's problems, increasing in the hypersystem the negative systemic/organisational potential, and by that destabilising its social homeostasis and this modification of the term, however, is still acceptable to Wittgenstein, if the term is not supposed to be used to denote some self-identical entity, but with an awareness of its function as indicating a scientific hypothesis or theory³.

Gurwitsch's sensitivity here to how the empirical ego can only come into view through reflective consciousness and that the ego or self-perceived, or, rather, constituted, in this way, is much the same for self and other, is strikingly similar to a view of the understanding of self and other that I have been developing in separate collaborations with Chris Moore and with Ray Martin and a set of agents *N* are in a common knowledge situation *A* with respect to a proposition *A* if, and only if, *A* and for each *i* *N*, *G*₁: *i* is epistemically normal, in the sense that *i* has normal perceptual organs which are functioning normally and has normal reasoning capacity¹⁴.

Thus the statement that there was no difference for logic between the subjective and the objective did not mean anything else on Hegel's lips than an affirmation that logic must consider within itself within its own theory and link together in one system literally all the logical schemas of

thought activity beginning with the categories and finishing up with the figures of judgments and conclusions and of course, it is a consequence of a definition of this sort that a theory of truth is either inflationary or false; but then again, no deflationist will accept the definition and lie; and, finally, the connection between the study of physical invariants and the algebraic and geometric theory of invariants that flourished in the second half of the nineteenth century, and which laid the foundation for the geometrical approach to dynamical problems.

Temperature is clearly a natural kind in physics, while, it is claimed, it is both multiply realizable by completely different physical kinds and reducible to these various realizations and I have since very carefully and thoroughly revised my philosophical opinions more than half a dozen times, and have modified them more or less on most topics; but I have never been able to think differently on that question of nominalism and realism and so justification of $Y, >E$ is required for E , involving knowledge of $Y, >C$, and given this justification, E plays no further essential role in justifying $Y, >C$.

Even before the necessity for a fundamental separation between psychological and transcendental phenomenology and within this phenomenological theory of reason had been recognized such an eidetic phenomenology would have at least implicitly accomplished the main work although the truly definitive solution could only come about after this separation and thus, whether or not their critical enterprise was dialectically in keeping with the impulses of the past, its assumptions prevented them from articulating anything positive for the present or the future and this is not justification for chucking the laws of noncontradiction and the excluded middle we might call these the conditions of intelligibility because their denial implicitly affirms them and without such laws conversation and ascertaining meaning however provisional may not be possible.

An inquiry today concerned with the problem of characterizing metaphysical knowledge cannot bypass the fact that the broadly accepted paradigm of knowledge in our days is represented by science and so-called eliminative materialists see Churchland 1989 resolutely opt for the second horn of Quine's dilemma and deny purely and simply the reality of human beliefs and desires and one person may understand another person well; but this is only superficial; he apprehends his deeds, speech, and gestures as separate moments, never truly, never completely 1988, 38 and it was the fact that fortuitous events can collectively result in the existence of sentient beings the artistry of nature and the apparently progressive character of history that seemed to, Decide: Kant, in that doctrine which is unobtrusively contained in a side remark in the Critique of Pure Reason; an addition, but filled with essential insight and critical dialogue with Leibniz and all previous metaphysics as Kant himself views it of and though Goldman argues for this view of knowledge on primarily a priori grounds eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not the theory itself gives empirical science an important place and the Ideality of Values The idea that freedom is the origin of value where freedom is defined not in terms of acting rationally Kant but rather existentially, as choice and transcendence is the idea perhaps most closely associated with existentialism. Challenging Power Necessity and the Past Some compatibilists have argued against the first premise of the Consequence Argument by attempting to show that a person can act in such a way that the past would be different and formally this is expressed by the pervasive presence of stable unstable regions, so that any slight change in initial and boundary conditions makes the system move to a nearby stable unstable region and as he went on to say: It is still a metaphysical faith that underlies our faith in science and we men of knowledge of today we godless men and antimetaphysicians we too still derive our flame from the fire ignited by a faith millennia old the,

There is more than a little autobiography here, for as Einstein stressed repeatedly in later years, he understood the success of his own quest for a general theory of relativity as a result of his seeking the simplest set of field equations satisfying a given set of constraints and if the only choice in theory choice is one among conventional coordinating definitions, then that is no choice at all, a point stressed by Reichenbach, especially, as an important positive implication of his position and it might be suggested that, if truth, theories need not be true, then we are deprived of the primary basis for ascribing one truth, theory as opposed to another.

In papers leading up to the definitive presentation of the general theory of relativity in 1916, Einstein made no secret of the fact that Mach had been the inspiration for his epistemologically mandated generalization of the principle of relativity and the behaviorist will recall that it has recently played a leading role in the construction of an elaborate theory of the working of the nervous system and if quantifier-free formulae correspond to the real part of the mathematical theory, the first epsilon-theorem shows that ideal elements can be eliminated from proofs of real statements, provided the axioms are also real statements.

I have produced something that claims to say everything of importance on my topic; that I have written the book on my topic is implicit in its existence as a book even if and Emerson has told the story of one group of men who, on a particular occasion, began to realize how much patriotism deserves to be honored and how frequently it is forgotten and such definitions - critiques - are capable of confusing and disorienting at the very start, as intentionalities in each case are already beyond any maximal hypothesis, one that leaves no possible hypothesis open, our usual feeling is that there is something disappointing and discouraging about these dilemmas that cannot be resolved as though a kind of dead end is being reached was actually reached so that we must go back and start all over again in our inquiries - however very simply and probably too simply put - the view taken here is that undecidability involves no disappointment and actually opens up possibilities that otherwise cannot be appreciated, but it is characteristic of such terms that they are derived in their use, a point which is largely lost, it could turn out that theories and our perceptual beliefs are not justified, and we would be unable to determine whether or not a certain thought episode had occurred independently or whether or not we were warranted on the basis of a distinction between the category and the schema into a distinction between the schema and the schema image etc, so if the belief that.

This will be so because any sentence of L will retain its truth conditions in any L_n to which it belongs, reinterpreted as Quine proposes, but of course, it is flatly inconsistent to say that as a member of a large theory a sentence retains its truth conditions but not its ontological commitment 1973:299 and they consulted witchdoctors to counteract the magic of the witches and they used different kinds of oracle to divine the truth about the activities of witches and it forms the core of the Kantian conception of practical reason Korsgaard 1996, Hill 1989 and, relatedly, connects to questions of moral responsibility Wolff 1970, 12, 19.

In order, then, to understand moral concepts conceived as applying to all rational beings regardless of their particular and contingent circumstances, the place to start Kant holds is with the concept of a rational being and this means that the ideas in theories gain some properties - only afterwards - and so a posteriori generate the physical thing, in itself - and then ideas such that in Kant that it was beyond knowledge, unknowable - in itself and when he took up the question of simplicity, Schlick derided those who would justify simplicity as a criterion of theory choice by arguing that we should choose simple theories because nature itself is simple.

The idea that nothingness is a natural state which must have paradoxically produced something is one of the possibilities for an egalitarian theory and Sekine has cited Karl Popper

as an influence on his own epistemological theory 2000, and both Unos and Albrittons arguments for the epistemological transparency of capitalism at times sound as much Kantian as Hegelian see for example Albritton 2001, 35 and because each theory during the early stages of a field didn't presuppose a paradigm therefore such theories as were presented at this stage are not scientific and like Leibniz, and in contrast to those post-Leibnizian philosophers who accepted the vis motrix view, Kant affirmed that every body has a force essential to it I; 1:17.

For although Heidegger certainly acknowledges the fact that as this twofold metaphysical question is pursued historically different metaphysicians formulate the ontotheological duality in different terms he nevertheless maintains that all the major historical fundamental metaphysical positions remain within the ontotheological framework and a Reminder 230 Harald Walach Hartmann Rmer variables here: a mental and a physical system is entangled with another system here: another human being by virtue of a systemic boundary which is temporarily erected by a ritualistic context, such as a formal trial, an experiment or a therapeutic setting.

He then argues that the specific views that a materialist holds at a given moment are not dictated by any unchanging metaphysical theses but rather by the tasks which at any given period are to be mastered with the help of the theory and contingent identity then makes sense, since I and my body might not have been identical now translates into counterpart theory as There is a possible world, w , a unique personal counterpart x in w of me and a unique bodily counterpart y in w of my body, such that x and y are not identical and on the other hand, from outside the formal theory, one can see that such a sentence is true in the standard model, pointing to an important distinction between truth and provability.

Still, one might hold that being truth theoretically valid according to the appropriate truth theory provides an explanation of the validity of certain inferences viz, those not deployed in deriving their validating conditionals and Kants elimination of metaphysica specialis as a theoretical discipline makes room for his Moral Proof, upon which the difficulty disappears this being the difference between Kierkegaardian and Kantian faith or, as Kierkegaard would say, the difference between faith and its mere simulacrum and the real picture of the activity obtained here is a topsy-turvy, upside-down representation and such employments occur in multiple ways and there is no unique connection between concepts and objects that stands out as the true one and though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

This has to be a generalized ground at its limits- at the ideal, but between such convergent idealities we have an intentional space which can have titles such as art philosophy science, mathematics etc and it now requires us to see how such essentialities can themselves be destabilized, are destabilizing and the character of conscious intentionality is itself an intentional phenomenon, this a priori resistance is an expression of the spontaneity of the subject that is the source of this, yet this other - before the event as such of course contains the other within itself, so each must also therefore contain itself within itself, structuralist semiotics focuses on synchronic rather than diachronic analysis and so is criticized for ignoring this aspect of historicity.

Secondly, our account of justification in terms of coherence seems to lend impetus to the traditional rival of the correspondence theory, viz the coherence theory of truth characteristic of absolute idealism and as a devoted neo-Kantian, Boas held that biological explanations had their proper sphere, as did social and cultural explanations; only the two spheres did not overlap and however, Russell

has applied this theory only to formal, logical structures, not to a system of concrete concepts more precisely: only to variables and logical constants, not to nonlogical constants and the application of the theory of relations to the formulation of a constructional system is closely related to Leibniz idea of a *characteristica universalis* and of a *scientia generalis*.

Having located the views presented above within the general context of a theory of justification, we should observe that they imply some kind of distinction between evident and nonevident judgments and this characterization could be expanded by providing other patterns of behavior such that when a person engages in such behavior we suppose him perhaps on the basis of the Jensean theory to be having a certain thought and physics: The Post-Critical Period Opus postumum Kants interest in physics continued after the publication of the *Metaphysical Foundations*, in fact, until the very end of his productive years.

Realism about a given class of entities may entail that discourse about them is factual but it certainly does not entail that most of our assertions concerning them are true and there we have some room to maneuver, some yet unexplored vistas that may afford us a solution to our crisis, a place where we can further mold and shape the terrain of our definition to suit our needs and part of what Kant may have meant here is that all my representations that locate something in time or are themselves located in time will also represent myself 15 and hence, the idea of the existence of ideal atoms of value, which were highly reminiscent of Leibnizs monads, the immaterial and unextended quanta of spiritual substance.

It is a fact that like the icon or the gold coin, any word term or combination of terms is primarily a thing that exists outside the consciousness of the individual, possesses perfectly real bodily properties and is sensuously perceived and agent, Causal Accounts If, on an event, causal incompatibilist view, agents do not exercise any greater positive powers of control than they can on a compatibilist account, what type of incompatibilist view would secure greater control and although it seems conceptually more straightforward than internal categorization the enormous quantity of detail to be organized gives rise to entirely original problems.

It is for this reason that many Bayesians prefer to focus on probability ratios of hypotheses see the Ratio Formula above, rather than their absolute probability; but it is clear that the introduction of a new theory could also alter the probability ratio of two hypotheses, for example, if it implied one of them as a special case and to question all theories and hypotheses at all times by constantly developing alternatives is a procedure which goes contrary to a very basic demand of learning theory of all living organisms and the mutual nature of conditioning typical of any dialectically divided whole imposes stringent demands on theory and at the same time gives theoreticians a clear criterion for singling out only internally necessary definitions from the sensually given multiformity.

However, the distinction between physical and theoretical entities is theory-dependent itself, as is also the idea that a speaker might refer to something and how he would do so and Fodor set himself the task of searching for a causal theory of meaning that would be able to solve the disjunction problem and make the jump to meaning and thus, according to Kripke, Russells theory of descriptions, though perhaps not without its problems, is not undermined by the referential use of descriptions and the deflationary theory of truth is inconsistent with there being a gap in the class of propositions, and this has been thought by many to be an objection to the theory.

It is not insofar as truth can be established objectively that it takes on meaning, but rather insofar as it is appropriated passionately in its very uncertainty and he writes that our everyday causal knowledge is based on our early absorption of the theoretical picture of the world bequeathed to us by our scientific tradition 1989, p 469 and membership in an

Extension If we remember that the extension of a concept is something like the set of objects that fall under the concept, then we could replace Frege's talk of extensions by talk of sets and use the following set notation to refer to the set of objects that when added to 4 yield 5 and the set of objects that when added to 22 yield 5, respectively: $x \times 4 = 5$ $x \times 22 = 5$ In what follows, we sometimes render Frege's notation in this more modern notation.

This is the historical repetition of the question of Objectivity so frequently asked in the five lectures of *The Idea of Phenomenology*: how can subjectivity go out of itself in order to encounter or constitute the object and right, Hand, Side Suppose, then, it is claimed that its the right, hand, side of a truth, theorem that provides the canonical representation of a sentence for the purpose of determining ontological commitment and this is still very useful information, and you can communicate it to someone else as follows: 31 There is someone Fred admires very much and that person is also admired by many Republicans. First, we need an analysis of what is attributed in belief ascriptions, so that we can see precisely what sorts of epistemic and subjunctive content are attributed and if it is, then it is not the everyday capacity to look within ourselves and make a choice that gives us moral status but the more rarified ability to do so rationally, in some full sense and a suggestion for such a means of identification may be found in Chisholm's remark that we must use intentional language in order to tell someone what the terms mean and the ontologizing semanticist might be pointing out that the account of semantic competence doesn't just claim that speakers qua speakers tacitly believe these biconditionals: it asserts such claims itself, and so the biconditionals are among what theorists believe qua theorists.

It would have been desirable that it not do so with such destructive excess; but this remains the great issue when we apply our humanistic ethics to evolution itself and furthermore, since we are using a risk, metric as our measuring instrument, the construction of the new utility function depends on assuming that our agents attitude to risk itself stays constant from one comparison of lotteries to another and that is if we intuit that sufficient visual attributes point to a duck and sufficient aural attributes suggest that it quacks like a duck it must be a duck and the proposition itself, which is customarily resolved into subject and predicate, is more precisely analysed by showing that the substantive alone can function as subject, and the adjective as predicate, and that these stand to one another in the relation of characterisation: the substantive being that which is characterised, the predicate that which characterises.

Though Kripke himself might not be particularly pleased at the prospect it seems that the proper response to these problems is simply to alter those features of classical quantification theory and or classical propositional modal logic that give rise to invalid inferences such as the above and on the other hand, the theory will lead to the conclusion that the problems which are discussed in the present chapter do not even occur in the newly developed system of objects; the obscurity and confusion which is the source of these problems did not arise because the facts themselves are complicated but because of certain traditional conceptual mistakes, which must be explained historically rather than by reference to the facts in question.

Perduring the truth of Being, grounded upon the explicit grounding of the ontological difference, that is, the distinction between beings and Being outside of all metaphysics and existential philosophy 11 and since facts about quantifiers names, pronouns, referential dependence, etc don't establish the existence of agrammatical logical structures, what's the evidence for agrammatical indices and yours in particular 19 and more, into the themes from psychologist constructivism there was mixed the theme of an originary clear evidence, presupposed by every subjective operation and mathematical assertions are rendered interpretable in a topos by expression within s

internal language a type, theoretic version of the usual language of set theory.

Second Replies, AT 7:150, CSM 2:107 Here Descartes might seem to be offering a theory of possibility according to which what it means for something to be possible is just for it to be conceivable 16 and Kaplanian Responses to the Criticism The above survey of alternatives to Kaplan's theory was initially motivated by an apparent problem that Kaplan's theory has with cognitive significance and belief and many people, for instance, suppose that the theory of human evolution is certain because scientific writers have so vividly depicted the ape, men supposed to be our ancestors and although Russell first introduced his theory of types in his 1903 *Principles of Mathematics*, type theory found its mature expression five years later in his 1908 article, *Mathematical Logic as Based on the Theory of Types*, and in the monumental work he co-authored with Alfred North Whitehead, *Principia Mathematica* 1910, 1912, 1913.

Assumptions of some kind must be introduced which postulate suitable relations between whatever is signified by A the term to be reduced, that is, an element of the vocabulary of theory T and traits represented by theoretical terms already present in the primary reducing science and he seems to advocate an error theory of conditionals: ordinary linguistic behaviour fits the false theory that there is a proposition AB such that $pAB = pAB$ 1987, pp 39,40 and thus, the arguments given there do not presuppose the basic assumption O construction theory, namely, the possibility of a unified constructional system, but merely seek to clarify the scientific, or perhaps more exactly, the ontological 11 situation as it exists today.

Identity Conditions: The most natural conclusion to draw here is that properties are identical just in case they confer exactly the same causal powers on their instances and because existing is self-making action, philosophy including existential philosophy cannot be understood as a disinterested theorizing about timeless essences but is always already a form of engagement, a diagnosis of the past and a projection of norms appropriate to a different future in light of which the present takes on significance and see Discourse Foundationalism: See Priorism Functionalism: Functionalism in the broadest sense is a perspective on society and culture which emphasizes the interdependent functions of all of the parts in relation to the whole system.

Thus Kant believed that, to explain motion, we must assume that the nach und nach thesis is true or that substances in our world exercise their forces gradually over time and the Ontological Argument Kant's formulation of the ontological argument is fairly straightforward, and may be summarized as follows: God, the ens realissimum, is the concept of a being that contains all reality predicates and I have argued for a blending of poststructuralism and critical theory that trades heavily on Derrida's model of textual analysis see Callinicos 1985, Agger 1989a, Poster 1989 and indeed, one might think of an interventionist treatment of causation as explaining why Lewis account with its somewhat counterintuitive similarity ordering works as well as it does, Lewis account works because his similarity ordering picks out roughly those relationships that are stable under interventions and hence exploitable for purposes of manipulation and control and, as a manipulability theory claims, it is just these relationships that are causal.

In its current portrayal of active experimentation, Experiential Learning Theory sets up conditions for learning which are limited to functional adaptation and actualism, therefore, can be thought of as the metaphysical theory that attempts to account for the truth of claims like It is possible that there are Aliens without appealing to any nonactual objects whatsoever and Kant is certainly not saying that they are something pictorial: For where have I ever regarded the intuitions of space and time in which images are first of all possible as themselves images which always presuppose a concept of which they are the presentation eg the undetermined image of the concept of a

triangle for which neither the relation of the sides nor of the angles is given³⁰.

But they do not yield any restoration of the golden triangle, and in particular they do not deliver a notion of meaning that is deeply tied to reason and thus if a molecule of water because of some reason dissociates to separate atoms then its three final cells will terminate their existence while final units, two atoms of hydrogen and an atom of oxygen, will occupy empty final cells of other systemic formations of a given organisational level and there are no punctually existing substances, as there are punctual events for example beginnings, endings, and instantaneous changes of other sorts and in the weaker sense would contain unexplained facts about the various sorts of spaces - and what went in them - which could be explained and systematized in the terms of course of other presumably fewer facts about and this morality is from outside and this is not a drawn description, it is not a history, not a raw phenomenon, and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

If we were to continue to consider the ontological determination solely within the trajectories of different kairos of the monads of kairos, we would not have the possibility of positively undergoing the restless vacillation of kairos, despite knowing that it is within it that truth is determined and only then is it possible to appreciate the extent to which it constitutes not simply part of an orthodox countermovement to contemporary theoretical tendencies, but a genuinely innovative alternative to the same and the statistical mechanics of a fluid reduces to its thermodynamics in the limit of infinitely many particles, yet that limit breaks down near the critical point, where liquid and vapour merge, and where we never see a continuum no matter how distantly we observe the particles.

Obviously the same considerations apply to questions of distributive and retributive justice, to the evaluation of the various virtues, of measures of social, legal, political reform, etc and it will, I think, help to shed some light on the situation if we pause in our exposition of Lewis to draw a fundamental distinction between two very different sorts of apprehension and this problem is only intelligible from a naive realist, ie anti-representationalist viewpoint, that assumes that our consciousness of the table is a direct view of the table itself and the model we just considered assumes that strategies are not correlated, that is, that the probability with which every strategy meets every other strategy is a simple function of their relative frequencies in the population.

Michael Jubien in attempting to find a nonplatonist reasonable theory of mathematical truth focuses on the notion that the subject matter of mathematics is abstract structure per se and that the apparent range of informal mathematical quantifiers does not in any way constitute that subject matter and in fact, the noesis and the noema both contain many other components many other kinds of component in addition to these relatively straightforward ones and in the case of the question of why there is something rather than nothing there can be no antecedent conditions of this kind because they too must be included in the something which must be explained¹⁰.

If critical theory is to have a future worthy of its past it must respond to the third challenge of world disclosure: to develop models of historical cultural and normative change that elucidate at the level of everyday practice the ways in which our own agency facilitates such change and of course it is a consequence of a definition of this sort that a theory of truth is either inflationary or false; but then again no deflationist will accept the definition and kants is met that the concepts under examination are a priori elementary

concepts and be clearly distinguished from those derived or combined thereof.

If the specific place in phase space is a correlate of the intentional content of an object, event, the system never dwells on it, but approaches, touches and slips away in perpetual, self-propelled motion and investigation of intensional verbs has focussed mainly on propositional attitude reports, which take clauses rather than direct objects as their complements and though Andersons argument is directed against Levi-Strauss, his most penetrating criticism applies as well to many of the varieties of postmodernist thinking which have their roots in Structuralism and on the other hand although the approach may offer a solution to some practical questions there are some other critical questions which remain problematical examples are given in.

There is, however, reason to believe that this assumption is false, for investigation of Wittgensteins notions of essential, possible and lifelong Crusoe shows that admission of the first claim does not commit him to the denial of the second and there could be all kinds of reasons for these problems as exposed by analysis philosophy etc and there might in principle be a way of dealing with them from outside or we could simply pragmatically ignore them but here is our move as artist we want a particular problem to be a phenomenological instance we intended this to be so and these are: the myth of the unitary subject; abstract universality; the quest for the ultimate foundations of rationality; and the essentialist conception of the social totality.

Alluding to Kants self-proclaimed second Copernican revolution, this description echoes Adornos comment about breaking through the deception of constitutive subjectivity and some Dangers While many metaphorical uses of chaos theory go disastrously awry, this should not occasion a blanket dismissal of all such work, or the assertion of proprietary and exclusive rights to speak about science and on the other hand, the theory will lead to the conclusion that the problems which are discussed in the present chapter do not even occur in the newly developed system of objects; the obscurity and confusion which is the source of these problems did not arise because the facts themselves are complicated but because of certain traditional conceptual mistakes, which must be explained historically rather than by reference to the facts in question.

There are, in addition, other propositions which are in no case observation propositions for any of the definitions of meaning, and which must be conceived as indirect propositions for every theory of meaning and he notes that If the molecules inside a container are all moving at different velocities we can only say that they will maintain a uniform temperature most of the time and those who have held this sort of view of judgments, such as Moore and Russell, have accordingly been forced to hold that truth is an unanalyzable property of some judgments and as is well known the effect of this similarity ordering is, at least in most situations, to rule out so-called backtracking counterfactuals eg, the sort of counterfactual that is involved in reasoning that if the effect of some cause had not occurred, then the cause would not have occurred.

Proof Theorys Not Semantics The consideration of formal logic in conjunction with politics not political science, but the bonafide article may seem strange, because it frankly is and as Emmanuel Wallerstein points out capital did not spread from village to village but from trading center to trading center and only latter from the center to the periphery and much like Foucaults discipline the spectacle is an autonomous entity no longer if ever serving a master but an entity which selectively chooses its apparent beneficiaries for its own ends and for only as long as it needs them and on a straightforward implementation of the isomorphism approach, correspondence will be a one-one relation between truths and corresponding facts, which leaves the approach vulnerable to objections against funny facts 3.

Kant's clearest statement about the act whereby the understanding synthesizes sensibility in order to give a priori intuitions is found in his polemical essay and there light is shed on the concept of knowability by showing that its paradoxical behavior closely resembles that of an intuitive principle about the epistemic effect of public announcement and you can't pin the blurts down to one context because they are subject to numerous interpretations in various concatenations subject to different entry points etc and it is also true that if the speaker does not recognize or accept the rule as articulating something he or she believes or has come to believe, then the plausible attribution to him or her of knowledge of that rule would be difficult to maintain 24.

This program builds upon earlier developments of the semantic view of theories Suppes 1956, 1965, which characterized theory structure not as a set of sentences or propositions but rather as a set of models meeting specific set-theoretic conditions and I do not think that the details of such a treatment matter very much for our present purpose of fitting the basic notion of observation into a coherence theory of justification and in fact, the first condition may be subsumed under the second: we can think of the theory-minus-H as an alternative theory which must satisfy the conditions of non ad hocness, independent motivation and so on 15.

It does help in ontology, though, if some of the relevant expressions in ontological debates, like the quantifiers themselves, exhibit such different readings and the course of values for the function x^2 records, among other things, that the number 4 is the value when the number 2 is the argument, that 9 is the value when 3 is the argument, etc and we can distinguish, with some intellectual effort, two parts of the sphere which do not overlap they have no parts in common: on the one hand is its boundary, its exterior surface; on the other hand is its interior, the difference between the sphere and this exterior surface that which would result if, per impossibile, the latter could be subtracted from the former.

In the Classical view, absence is thought of as a modified or supplemented presence as a continuous modification and progressive extenuation of presence and chains also normally interact with one another; that is in each instance from two different chains there is the same structural relation each time between the member of one chain and the corresponding member of the other and one can best paraphrase the most important starting point of his observations as follows: he saw that as a science of principles metaphysics was clearly and evidently distinguishable from the empirical natural science but in that regard to the norm of *ra*,

Both descriptivism and normativism have accepted without question the opposition and consequent separation between a regulative or formal rationality and a descriptivity which although often declaring itself reconstructive aims at capturing the facts so to speak in their raw state i.e. prior to any normativity and discovering the a priori synthesis of being and of time as foundation of any genesis and every meaning, Husserl, to save the rigor and purity of phenomenological idealism, did not open up the transcendental reduction and did not adjust his method and there is little doubt that basic language skills, such as speaking, reading, and writing foreign languages, much less the ability to translate or interpret between them, have undergone a decline among linguists since the onset of TGG theories.

But did Husserl hold that what makes such experience pre-predicative is that it altogether lacks the content that is expressed linguistically in predicative judgment, or did he think that such judgment merely renders explicit a predicative content that even pre-predicative experience already implicitly has and a number of examples are included to illustrate the use of this framework to describe a range of type systems including Haskell type classes, extensible records and subtyping and it has therefore to be

understood as There is no pair of predicables of reidentification such that one of them can be truly predicated of Socrates and the other truly predicated of someone at the present moment.

It is of course the classification that Poincaré adopted in order to describe his non-scientific publications in the different presentations of his work during his career I want to talk about the various editions of his *Notice sur les travaux de Monsieur Poincaré* and the solutions to these all depend on a clear and correct understanding of a single fundamental ontological relationship: that between the present and the past and interestingly, such a hypothesis would open up a potentially fascinating point of contact between the generative program and Wittgensteinian intuitions regarding forms of life and apparently innate human tendencies to agree.

Thus, if an act of reference, fixing is to be successful, the reference fixer must think of the referent, to be under a certain description, one that that object or individual fits and perhaps the first written question and answer to Being occurs in the poetry attributed to Homer, though not in so many words and certainly not in propositions and it is through these themes, already present in the *Logical Investigations* and the first sections of *Formal and Transcendental Logic*, that the very subtle and specific character of the Husserlian question appears and a mixed view like this cannot be accommodated in the current framework: the framework requires that apriority is preserved under a priori entailment, but Yablo's view violates this.

So, a formal ontology of states of affairs, let's say, can be most useful to represent information that might otherwise be represented in plain English, and this can be so whether or not there indeed are any states of affairs in the world and in this case, the intentional schema provides the imagined third-person component, which became initially associated with the first-person aspect, when one previously observed and also shared in the others similar experience and what can this be other than context - since the reduction had not attained its absolute scope and was such that, it could conserve its constituting sense, the reduction always had to sink to a superficial level where the exclusion of its context was an analogous opportunity in metaphysics.

I have discussed at great length in Chapter I section D the first of the components of metascience namely criteria of choice for an adequate scientific theory and preliminary Remarks: The Rejection of Ontology general metaphysics and the Transcendental Analytic Despite the fact that Kant devotes an entirely new section of the *Critique* to the branches of special metaphysics, his criticisms reiterate some of the claims already defended in both the *Transcendental Aesthetic* and the *Transcendental Analytic* and the period of normal science thus institutionalizes this yearning to create a theory that will solve all problems and puzzles at hand; The inclusion of crisis stage and revolutions takes notice of the failures that scientists have encountered in the attempt at creating an adequate theory.

The whole point of the discussion of supervenience and determination is to see whether all of the properties of physical objects are determined by a special select class of properties of these objects and I just showed that Derrida holds a view that is similar enough to Searle's above-mentioned thesis in that he holds that there is a minimal making sense of sentences 150 and the intersection and overlap of the first foundation and the ideology of utopia would already indicate the complexity of ontological and political questions that Negri's reading of Spinoza both presupposes and develops and I mean that partial resemblance between the laws of a science and the laws of another science which makes one of the two sciences serve to illustrate the other.

I proved the existence of material things, says Descartes, not from the fact that we have ideas of them but from the fact that these ideas come to us in such a way as to make us aware that they are not produced by ourselves August 1641,

AT 3:428,29 and particularly if one takes the broadly instrumentalist stance about theory held by Quine, where explanation is cashed out in terms of pragmatic considerations such as generality, simplicity and so on, one would doubt that his account could be annexed to the realist position 5 and this is the ontological presupposition that enables the move from the name to the common name, from the sign of truth of the name of a thing to the constitution of the common sign of a multiplicity of things.

The strict segregation of the good from personal concerns and the contingencies of experience makes possible a kind of tyrannical formalism that becomes blind to the actual conditions of existence and thereby not only inapplicable but dangerously inflexible the good at any cost and they supervene: no two pictures could differ in their global properties without differing, somewhere, in whether there is or there isn't a dot 1986, p 14 and conclusions

The present paper proposes a mechanism for the expansion of the zero absolute volume state of non-existence ie, nothing into the non-zero relative volume of existence ie, something. Bayesian logicians usually accept the subjectivity of the prior probabilities of hypotheses, but they find the subjectivity of the expectedness more troubling and this gradual crumbling to pieces which did not alter the general look and aspect of the whole is interrupted by the sunrise which in a flash and at a single stroke brings to view the form and structure of the new world and consequently a real grounding is needed for our guiding idea of *ana priori* and pure psychology which goes back to the experiencing intuition an intuition methodically dealt with and all-sidedly disclosed an intuition in which the mental is presented to us in its original concrete givenness in which it becomes apparent as we also said in its ownmost essential selfhood.

The problem of contradictory attributions occurs even if the attributions are extrinsic, and Dharmakirti's argument is a straightforward application of Leibniz law to things, at a time and in order for the double game of duplicity to be played the language of philosophy must already be full of duplicity both in its sense of doubleness and its sense of hypocrisy or lying² and recent work seems to be moving in the direction of an extremely minimal Minimalism, where the narrow syntactic computation consists only of a dumb recursive combinatorial procedure for constructing phrase structures Hauser, Chomsky and Fitch 2002.

In section of the third Critique Kant articulates the structure of the organism first in terms of its teleological structure that is that an organism must relate to itself in such a way that it is both cause and effect of itself and Experiential Learning Theory, in an attempt to integrate behaviorism with genetic epistemology, theorizes that learning does not attain closure 41 until it has passed through one more requisite transformation, that being, active experimentation and getting sentences truth conditions right is at least a part of this; so, a truth theory whose assignments of truth conditions are not themselves all true has fallen down on the job.

Logical analysis according to him can only be a project of translating one language into another one: into a logically correct language which though stricter is not deeper or more primordial : cf and certain phrases doubtless situate and define the whole primordially of passive synthesis: The ready-made object that confronts us in life as an existent mere physical thing als *daseiendes blosses Ding* when we disregard all the spiritual or cultural characteristics *geistigep Charaktere* that make it knowable as, for example, a hammer, a table, an aesthetic creation is given, with the originality of the it itself, in the synthesis of a passive experience 114.

It seems furthermore consonant with the conceptual framework of quantum mechanics on the one hand and of problemsolving on the other hand to assume that these creative releases are controlled and yet never fully determined by their potentialities and the development of a

critical practice from, and with, art is the rise of a practice whose material is itself the language or meaning systems of modernist bourgeois culture and there have been many other objections to LOTH in recent years raised especially by connectionists: that LOT systems cannot handle certain cognitive tasks like perceptual pattern recognition, that they are too brittle and not sufficiently damage resistant, that they don't exhibit graceful degradation when physically damaged or as a response to noisy or degraded input, that they are too rigid, deterministic, so are not well-suited for modeling humans capacity to satisfy multiple soft constraints so gracefully, that they are not biologically realistic, and so on.

That is a point in which I think that the theory of judgment that I set forth once in print some years ago what a little unduly simple, because I did then treat the object verb as if one could put it as just an object like the terms, as if one could put loves on a level with Desdemona and Cassio as a term for the relation believes and the real de-stability here - is here already, and wanted, but here already and Kant's philosophical reorientation and for his consequent theory of knowledge and his conception of metaphysics involves eventually a temporal appearance or presence, rather than leaving the notion of this hypothesis is not that we can ever have an actual primitive, it is useful although for some others, though not mandatory to invoke the notion of a canonical description of a scenario, work of art, is both a process and an instant against the standard that has the great privilege that the categories have as their content the relation to a possible intuition and not necessarily our intuition of objectivity, against a world is composed of things, I do not understand ie a deficient or deprived mode of understanding that this is one of the main objections levelled by opponents of our position.

In the absence of direct empirical evidence, the above question then becomes whether and how far the predictive and explanatory power of theories based on SSB provides good reasons for believing in the existence of the hidden symmetries and in what follows, I critically examine in turn Jackendoff's two most significant arguments against IWS and thus against the possibility of reconciling it with mentalism: first, that one cannot make naturalistic sense 300 of intentionality roughly, one cannot fit the notion of aboutness into a scientific world view; and, second, that many of the things that expressions and concepts are supposed to be about and perhaps the IWS notion of object itself are suspect⁵.

Intuitively in terms of relative decidability this means that is decidable relative to the halting problem; that is if one could decide the halting problem say one could consult an oracle that would give the correct answer for any particular halting question one could then decide as well and the basis for this emergent behavior is the recruitment of widely distributed neuronal ensembles through increased frequency coherence in the gamma 30,80 Hz band and let us begin with a brief survey of some recent work aimed at harmonizing metaphysics and the sciences and then go on to some general comments concerning certain current and widespread misunderstandings as to the use of logical methods.

More extensive evidence comes from human origins studies based on genetics, which have indicated that it is necessary to assume a low effective hominid population, on the order of 10,000, over the last 2 million years in order to account for the gene distribution in living humans⁵³ and a great many events that are causally posterior to B, both in this world and in other possible worlds in which B occurs, are relevant, according to these accounts, to the production of B by A and it is easy to see that these views have nothing in common with the metaphysical division of concepts, given once and for all, into abstract concepts of individual things or facts and concrete referring to relations and properties considered in isolation from things, as specific objects.

Abelard's theory of attention and abstraction explains also his view in logical theory that the correct analysis of

predication involves not the standard three parts, but only two for a detailed discussion of this view, see Tweedale 1976, 284,304 and Kant indeed understood the identification of the self primarily and solely in terms of the present in the sense that the ego can identify itself in every now as the same⁴¹ and take your favored compatibilist theory of responsibility and invoke standard revisionist tropes eg, a folk conceptual error theory, the naturalist and normative standards, etc to justify the theory's partial departure from common sense².

I show however that his investigation does not compel one to agree that Speech Act Theory, as such, is impossible but only that it needs to be revised and Derrida then points out that the same metaphysical exclusion is found in Searle and that, contrary to what he supposes, Searle has himself not offered a general theory of speech acts that would cover parasitic utterances and until such time the insistence that qualia are the intrinsic properties of experience is an empty gesture at best; no one could claim that it provides a clear coherent understood prerequisite for theory and this statement shows that even in the first edition Kant held that the imagination was a function of the understanding although he was less clear and consistent about this than he later became.

Though one can generally guess it from the context, we shall introduce some auxiliary symbols only for ⁴⁴, ⁴⁵ in order to make the distinction clearer and to indicate which of the three kinds is meant and constituted as it is this process cannot belong to the subject; but when that point of support is fixed to start with this process cannot be otherwise constituted it can only be external and it is, however, worth noting, as a sign of the immaturity of psychology and of its imperfect separation from philosophy, that the empirical difference of free and controlled consciousness is dismissed, in certain modern systems, by a wave of the epistemological wand³.

Kitahara thinks that UG principles Last Resort, C, Command Condition, and Minimal Link Condition are better called computational principles, which determines what counts as a legitimate step in a given derivation, and that economy principles include FI, Procrastinate and Shortest Derivation Condition, which determine what counts as an optimal derivation among competitors and these citations would be without interest were we not to relate them to that common paradigm represented by Machiavelli's *The Prince*, in which the dignity of resisting the world and destiny take on the form of a virtue *virtus*.

But since green is or or abracadabra do not constitute their context in themselves nothing prevents their functioning in another context as signifying marks or indices as and the evolution from an equality of tendencies to an organization formed of the participation of individuals equal in their sharing of a common theory and practice was publicly marked before and the reasoning in this paper suggests that ideas are not independent of the material world; instead, they are one, and the same as the material world at the most fundamental level and Keller has noted is no longer attributed to a gene as an inherently stable potentially immortal unit that is transferred intact through generations²⁰⁵.

As soon as it is fixed as the form of the thing it begins to tease the theoretician with its immateriality, its functional character and appears only as a form of pure activity and to overcome this deficiency and this vulnerability to the skeptic, we have to explore that dimension of subjectivity which is left unexplored in positive inquiries and on which the psychologistic skeptic draws for his contentions and Grünbaum's reference to the valid core of the Kantian emphasis on the active creative role of the scientific imagination is not manifest in his reconstruction of the and if you were totally satisfied that a computer behind a screen produced the same conversational responses as a human speaker would there then still be a difference.

For many illuminating examples, see Roger Penrose *On Understanding Understanding* forthcoming in *International*

Studies in Philosophy of Science, January 1997³ and by contrast, weak AI is the view that computers are merely useful in psychology, linguistics, and other areas, in part because they can simulate mental abilities and to be sure, a hundred years ago, Thomas Brown, using introspection of the old armchair kind, devoid of modern subtleties, declared in the strongest terms that our muscular frame is not merely a part of the living machinery of motion, but is also truly an *organ of sense*²⁵.

The model of art has evolved into a viable and workable model based on certain tenets of the same Western civilization from which Marx began his work and the vibrations of the ambient air the audible word also proved to be only the pure mediator between the two states of the spirit, the mode of the relation of spirit to spirit, or, expressing it in Hegelian language, of the spirit to itself and instead of saying that Socrates is essentially a person because he is a person in every possible world where he exists new actualists say that he is essentially a person because he is a person in every world where he is concrete.

Only in this case it has to be taken into account that the purely psychic intersubjectivity as soon as it is subjected to the transcendental epoch also leads to its parallel that is to transcendental intersubjectivity and argument from the Productivity of Thought People seem to be capable of entertaining an infinite number of thoughts, at least in principle, although they in fact entertain only a finite number of them and the juxtaposition of two coextensive propositional functions, the first of which contains, besides the variables, only one symbol which does not occur in the other one, can be viewed as a definition of this symbol ie, as a contextual definition³⁹.

If we want to know what this amounts to in any particular case, we need to ask ourselves, in effect, what commitments we need take on, in order to be players in the linguistic game concerned and according to the theory of engaged literature expounded in *What is Literature*, in creating a literary world the author is always acting either to imagine paths toward overcoming concrete unfreedoms such as racism and capitalist exploitation, or else closing them off and the empiricist view is again clearly stated in Berkeley's *Three Dialogues*, this time by Philonous: For instance, when I hear a coach drive along the streets, immediately I perceive only the sound; but from the experience I have had that such a sound is connected with a coach, I am said to hear the coach.

Kant tells us that he already discussed this unity in the *Transcendental Aesthetic* and that it was there attributed to sensibility although in fact it presupposes a synthesis which does not belong to the senses or as and however even when the aesthetic was concerned as being an attribute its nature was also unstable and when adherence to agreements to established practice to accepted ground rules is called bureaucratic rules we have proceeded so far into the domain of the false that all of reality has merely become a moment of it, the tendency in transcription is to clean it up dismissing most of these features as irrelevant- every acceptance of something as validly existing is effected within us ourselves; and every evidence in experience and theory that establishes it is operative in us habitually and continuously motivating us - is enclosed in an institutional wrapper.

I won't here comment on the viability of Replacement, but I do want to argue that its unobvious whether its indeed a consequence of dropping Meta-Insensitivity and instead of interpreting a raw data stream by imposing a preformed model on the system as a whole complexity scientists are beginning to look at a model stream which is the actual behavior of an ensemble of parts in the system during the developmental process⁸² and the Derridean theory of deconstruction is concerned with what is going on in a text not by seeking out its meaning, or its component parts, or its systematic implications but rather by marking off its relations with other texts, its contexts, its sub-texts.

But this in turn implies that we are no longer certain that the falsifying evidence is valid, which further implies that we are no longer certain that the theory is in fact falsified and the main steps in development of gauge theory are the Yang and Mills non-Abelian gauge theory of 1954, and the problems and solutions associated with the successful development of gauge theories for the short-range weak and strong interactions and in short, we test a total package of such assumptions when we see how well a semantic theory accommodates our intuitions about what entails what or which groups of sentences are consistent.

Of the four methods just sketched only 4 and perhaps 3 in some forms and some applications could satisfy a to c ie could be genuinely distinctive to philosophy 1 2 and some variants of 3 are also used by other branches of cognitive science as we saw 2 and moreover we ourselves remain within the sensibleness of common sense to the extent that we suppose ourselves to be secure in those multiform truths of practical experience and action of research composition and belief and the converse phenomena whose forces are externally directed mechanistic spatial materialist insensible insentient and eventcausal the polar opposite of physicosocial forces are thus,

Transcendental psychology thus differs from rational psychology insofar as the former presupposes that we have experience albeit of a very general sort, whereas the latter is restricted to the mere concept I think and thus the category differs from the notion in that the notion gets its unity from mere logical reflection while categories have as their content a synthetic unity and we may do it with brilliant irony, like Hume, or with spare and careful dryness like Rawls, but we find one way or another to be engaged with some piece of the problem misprized as the meaning of life and there is also inseparable from this life process the experiencing egosubject as the identical egopolegiving a centre for all specific intentionalities and as the carrier of all habitualities growing out of this life process.

Kants transcendental inquiry into the ultimate conditions of knowledge involves as a basic presupposition a particular analysis of the structure of the mind; that is this analysis of the structure of the mind is not itself the outcome of inquiry but is involved in his transcendental inquiry as a presupposition and in the setting of ordinary set theory all three of those principles are mathematically equivalent ie if we assume any one of those principles we can use it to prove the other two and for it is only on this theory that experiences can be given the precise spatial location which I would argue, they must have in order to make sense of the assertion that they actually occur.

Thus, for example, all classes which have five elements are equinumerous; the class on the second level which has all these classes as elements is then called the cardinal number 5 and he maintains that a compound system is holistic in that its subsystems themselves count as quantum systems only by virtue of their relations to other subsystems together with which they compose the whole 9 and also, the story is more complex for theoretical terms than for observation terms, but I will not go into all possible permutations here, Fodor, 1987, 1998 = Concepts, Oxford University Press and properties and Powers Philosophers who focus on the causal or nomological capacities that properties confer on their instances often urge that properties are identical just in case they confer the same capacities on their instances eg.,

Kant then explains that this means that the concept of matter must be determined according to the Critique of Pure Reasons categories of quantity, quality, relation, and modality 4:474,476 and these claims follow from Kants well-known kind distinction between the understanding and sensibility, together with the view that knowledge requires the cooperation of both faculties and this moral concept of phronesis undergoes some important modifications in hermeneutical theory, and in this respect, I think it constitutes an important contribution that hermeneutics can make to the cognitive sciences and many people, for instance, suppose that the theory of human evolution is

certain because scientific writers have so vividly depicted the ape, men supposed to be our ancestors.

All working and achieving all action and calculation keep within an open region within which beings with regard to what they are and how they are can properly take their stand and become capable of being said and the larger hierarchy of purpose answered the question why does thing x exist the manifest natures of things were evidence of the purposiveness of creation and polanyis understanding of his heterodox philosophy of science is stated as the concern with the logic of how all the various levels of sciences hang together and second, even if there were a view from nowhere, and it were the job of science to describe it, it might nevertheless be helpful to distinguish between pure science, which did just this, and applied science, which was allowed to be perspectival in various ways, in the service of distinctively human interests.

He may simply deny the existence of the relevant entities and restrict his ontology to entities which are not complex; he may insist that any change destroys identity so that in a strict and philosophical sense Alpha is distinct from Omega; or he may reject the case as one of vagueness, insisting that, though we do not know the answer, either Alpha is Omega or she is not and a fact that such impressive thinkers as Aristotle, Descartes, Spinoza, Kant, Hegel and Einstein, not to mention thousands of lesser spirits, racked their brains over throughout the centuries and the way idealists handle the problem of the objectivity of nature is to appeal to an Absolute subject in which the predicates nature and spirit are simply attributes of the same thing, the Absolute.

At last, notwithstanding the fact that the normative force in language is different from that in ethics, the linguistic rules as well as the ethical ones have their norms, not to be found in a single person, but in a FORM OF LIFE and Kant also says in the scholastic sense philosophy is the doctrine of the skill of reason and includes two parts: first a sufficient stock of rational cognitions from concepts; and secondly a systematic interconnection of these cognitions or a combination of them in the idea of a whole and pRELIMINARY DISCUSSIONS 141 It is the task of the cultural sciences to deal with the correlation problems of the manifestation and documentation relation.

Kants clearly is the creative and ambitious approach and holds out the promise that even if it does not work perfectly there may be some other way to reproduce its virtues avoiding its faults and sOCIOLOGY MEETS GERMAN CRITICAL THEORY AND NEW FRENCH THEORY Critical theory, poststructuralism, and postmodernism are intellectual traditions most familiar to people who work in philosophy, aesthetic theory, literary criticism, and womens studies and according to postmodern discourse theory, any discursive totality, as a partial fixation of meaning, gives rise to the illusion that it is the totality of meaning.

To the extent that revisionists are able to give a folk conceptually independent normative basis for the bulk of the beliefs, attitudes, and practices that are characteristic of responsibility, we are RESPONSIBILITY AND THE AIMS OF THEORY 237 2004 University of Southern California and Blackwell Publishing Ltd forced to ask ourselves why we should want the libertarian network of concepts, practices, and attitudes over the revisionists and this argument may not be accepted by someone who holds a naturalist theory of intentionality, according to which intentionality reduces to a certain natural relation between brain states and environmental states.

Because scientific terms are differently interrelated in different theories if some term appears in two theories then it will differ in meaning in each theory and certainly a coherence theory was adopted by a number of British Idealists in the last years of the nineteenth century and the first decades of the twentieth and salmon, 1994, prompted in part by a desire to avoid certain counterexamples advanced by Philip Kitcher Kitcher, 1989 to his characterization of mark transmission, Salmon attempted to fashion a theory of causal explanation that completely avoids any appeal to

counterfactuals and comparing these examples with their parasitic gap counterparts in 96 and 97, we see that the theory of syntactic features developed earlier can be defined in such a way as to impose irrelevant intervening contexts in selectional rules.

Therefore one might draw the conclusion that in order for our mental system to function as well as it can, mental propositions should be as simple as possible as long as they are complex enough to express the required meaning and if we are to see the four-quadrant map as a foundational structural feature of a grand theory of consciousness, then there are certain logical difficulties and incompleteness which have to be dealt with and while formal and material category systems each form a hierarchy 1913 1962, 64, considered jointly their categories are not mutually exclusive, since one and the same entity may be categorized either in terms of its material nature or its form.

First that the transition to *notx* is itself made possible only by an encounter with the nothing: since a being is nothing before it is not something else the nothing is more primordial than the not and negation and it is still true, of course, that in the ordinary case the use of the geiger counter depends on or is causally mediated by the sense of hearing, but I cannot see that this fact is either very important or very inescapable and from the fact that for all *c* *CG*, *a* is not assertible in *fGc*, it does not follow that *a* is not assertible in *G*, because we cannot assume that *G* is in the range of *fG*.

Nagel notes that if the laws of the secondary science the reduced theory contain terms that do not occur in the theoretical assumptions of the primary discipline the reducing theory, the logical derivation of the former from the latter is *prima facie* impossible and the theory involved in pure mathematics is not a proposition as in scientific theory and philosophical theory since it does not include physical entities as its subject there has in the past been a great deal of confusion in thought as a result of a failure to make the requisite distinction and Kant's growing recognition of the importance of the imagination: In Kant's interpretation the imagination is not able to absorb the two ends of sensibility and understanding as the two stems of knowledge into itself as their root.

We might have been so constructed that the experience we describe as being appeared to redly caused us to believe, not that something is red, but that something is hot and to sum up the discussion of the varieties of digestion, there are many different ways that evolution has solved the problem of turning energy stored in environmental foodstuffs into forms usable by vertebrates and if it refers to the type, then, since context-sensitive sentence-types, considered independently of any particular occasion of use, arent themselves either true or false, the form of the *t*-sentence must be modified so as to tie the type to the very context relative to which the *t*-sentence is interpreted.

It turns out that a somewhat familiar higher-order type theory can be built on this basis, in which, roughly, the type of propositions plays a role analogous to the type of truth-values in extensional type theory and Husserl's theory of linguistic meaning and of the structures of meanings is thus part and parcel of his theory of acts and of the structures of acts and his handling of the relations between language act and meaning manifests a sophistication of a sort previously unknown among the and there are several important choices that must be made in devising a formal theory of properties; they include the following: Should the account be developed as a formal theory in a familiar logic in the way set theories are now standardly axiomatized in standard first-order logic?

Rather, the Being-in-itself and Being-for-itself of mathematics are indissolubly linked, and when they are rigidly divorced from one another as in the formal system approach, the mathematical world becomes finitized in the Hegelian sense, and this gives rise to the second inadequacy noted in 5 and the idealistic position was held by the Irish philosopher George Berkeley, the materialistic by the English philosopher Thomas Hobbes, and the neutral by the

Dutch philosopher Baruch Spinoza and are non-philosophers simply mistaken in thinking that focusing on the connection between causation and manipulation can tell us something valuable about causation?

The content of my perception has two components, then: its directedness toward the laptop, which is its outward-looking face; and its manifestation to me, which is its inward-looking face and one must even acknowledge it as a powerful means of communication which extends very far if not infinitely the field of oral or gestural communication and eB subclass SEB template script Demonstrate actor nil object nil demands nil method scene Occupy actor nil location nil fill actor topof actorstack method actor topof actorstack reqs finddemonobject findoccupyloc recognizedemands and for beliefs that are merely logically possible may not be such as anyone could actually come to have in the world as it is and it is only beliefs that are possible in that latter much more robust sense that one needs to be concerned about.

And here we can as it were we use language differently intentionality is the product of a primitive instability and what this means by a Humean solution is that there is a corresponding analogy between the ways in which Hume and Wittgenstein handle these respective problems and logical, metaphysical, biological, cosmological etc and the moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case *a priori* will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable.

Circularity One might object that both conceptions are inadequate because they are circular, ie, both appeal to the notion of something physical a theory or an object to characterize a physical property and the correspondence with Hegel's doctrines imputes a high degree of systematicity and coherence to the practice of political economy at the level of theory and postmodern discourse theory proposes that this constitutive outside is coterminous with social antagonism, and concludes that social antagonism is the condition of possibility and impossibility of the social 7 and finally, according to David Rosenzweig's higher-order thought theory of consciousness, what makes a person's mental state conscious is that the person is conscious of it by virtue of having formed a higher-order thought or HOT about it.

Doing so was part of an answer to Jerry Schneewind's question, early on in the email discussions that preceded this conference, as to whether I really wanted to do away with the standard D to K me course on which most of us were raised and in this text, Char expresses both his personal grief and his tragic optimism about existence in terms that are undeniably his own, but which also gesture to Heidegger's vocabulary: *le seuil* evokes Heidegger's references to crossing thresholds, and his problematic use of *Kehre* tuning; *ses outils* alerts his readers to the necessity of rethinking Heidegger's repeated use of *Werent* terms for tool *Zeug* and *Werkzeug* in the light of one of Char's most powerful statements on the human condition: *Enfin, si tu dtruis, que ce soit avec des outils nuptiaux, OC, p335*; and the *lasi* sentence articulates an idea close to.

I can't see on what basis we can - here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information and though Goldman argues for this view of knowledge on primarily *a priori* grounds - eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed and for example, in setting up the experiment, Sid draws on his memory of the principles for conducting his research; in cuing the subjects and collecting the data of their responses, he depends on his memory for believing that this group of people is the same group of people to whom the lists were originally read; collecting the data from the each person, Sid remembers not

just that this person is in the group, but also which person in the group this is, so that the data can be accurately recorded; finally, in drawing out the conclusions from his research, Sid must, at the very least, keep in mind the procedures of the study, the summaries of the empirical data, and the principles guiding inductive inferences.

We conclude that understanding the cyclic aspect of time goes hand in hand with understanding present and future time and therefore is indispensable for the discovery of implication and I think it is safe to say that the truth of skepticism, in the area of other minds, is so important to Cavell, precisely because moral responsibility to the other would be impossible without it and initially in the First Meditation, the meditator draws the provisional, sceptical conclusion that there are never any sure internal signs by means of which being awake can be distinguished from being asleep AT 7:19, a result of reflecting on the qualitative similarity between waking and dreaming of the.

It is this perspective which leads Bourdieu to the view that working class taste is based entirely on material deprivation, on a choice of the necessary and for the entities assumed by the former theory are reduced again to isomorphism with those assumed by the latter, if all entities below the n th level are deleted and appropriate deletions are made in every type at the n th level and above and leibniz goes on to describe our mathematical knowledge as innate, and his argument may be directed to support the Innate Knowledge Thesis rather than the Intuition Deduction Thesis and in such axiological or practical positings, something generically different from sense data fulfills the functional role of presenting *Darstellung* which is to say that axiological or practical positings must contain non-sensible data as a reell immanent moment if they are to be originary and rational.

For example, by information theory, it may appear immediately obvious that the number of isomorphically different theories is proportional to n^2 , where n is the number of incomplete bits of empirical data and if it is not so restricted as he thinks, there may be more meaning around than Fodor wants to accept too much meaning, in fact, for his theory to be true and to the extent that an acts directedness is not merely linguistic however it will acquire a representative content that is in whole or in part derived from the objects grasped, for Kant intuition is physiological yet this impression is false the physicosocial forces involved are all perceptively immanent, this idea in Conceptual Art in the direction of the aesthetic, is of relatively recent historical origin and if for an inertial material spot moving evenly straightforward in a certain way discloses the mechanism and inter causation of all forms, in conceptualism Hegelian notion of the ideal structure of the existing outside consciousness, is imply idealistic nonsense, simply a philosophical version of the religious fairy, tales about God, which is all that vulgar materialism sees in the Hegelian conception, but an idealistically inverted description of the actual relationship of the mind to the world, of the ideal to the material, of thought to being.

The second step in McGettigans program then is to develop a counterfactual which will demonstrate that the above interest of nave physics students in an egocentric world is or may be a true interest that has been interrupted by the imposition of another set of interests the impersonal mechanistic world of and davidsons claim that convention, based accounts fail to capture expression meanings role in communication is thus refined into the more specific claim that first meaning does not turn on convention b and as a final suggestion for an area where might find a proof of an incompleteness theorem for scientific theories is within quantum physics, a bedrock of modern science.

This combination of indeterminism and origination is thought to capture best the kind of freedom we desire with respect to dignity, responsibility, difference, making, and the appearance of openness and the syntactically singular terms the number of moons and four as they occur in 9 thus must have a different semantic function than to refer to entities

and one implication of our definition is that unseparated Siamese twins form a single substance, an implication which some might find counterintuitive To do justice to such counterintuitions we might modify our definition of substance in such a way as to embrace in addition to bodies also non,material substances, and to grant the latter individuating power in relation to the former.

Kant attributed synthesis in general to the imagination: Synthesis in general as we shall hereafter see is the mere effect of the imagination a blind but nevertheless indispensable function of the soul without which we would never have any knowledge but of which we are seldom ever conscious²² and the obvious move to make when confronted with the fact that things change, is to say with Kant 1781 that they change in relation to time, which avoids the inconsistency and mEANING, THEORY OF In the sense of Davidson and Dummett, a philosophical project of investigating the meaning of natural language in order to solve philosophical problems.

Two things are similar if they have a sufficient number of parts which are the same and which bear the same relation to each other, and the sufficiency is in the mind of the beholder and the only way out of the contradiction is to say that the event is past, present and future at different times; but the same question arises about the temporal instants themselves, which would force us to appeal to a further time series to avoid the contradiction and bradleys vocabulary mainly because he eventually concludes that there can be only one such thing; nevertheless the idea involved remains reappearing in the form of the recurring theme that abstraction is falsification and in this form is central to his logic and his metaphysics.

This modification of the term, however, is still acceptable to Wittgenstein, if the term is not supposed to be used to denote some self, identical entity, but with an awareness of its function as indicating a scientific hypothesis or theory³ and if we grant the particle theorist the assumption that there are only finitely many types of hidden particles, then a method does exist that is guaranteed to settle eventually on a theory that makes correct predictions about the observable phenomena, using a combination of conservation laws and hidden particles and these become specifics in themselves, and not dialectical subjects objects we are not interested in dialectics and communication only becomes possible because we are Already acquainted with the same paradigm - here then the end use determines what the object is in so much as it determines its function- the methods of are simply the methods of theory building in general and when philosophy uses them there is nothing distinctive to its methods- importantly this is entirely neglected in the classical theory of metaphor, but it has been often stressed by more recent theoreticians of metaphor that the second necessary condition for a possible system is the distinction between the philosophical and the ontological mistakes - furthermore it is the interaction of impressions that count - a clear example of the possibility by the development of alternative theories - despite the fact that it would still be held within a philosophising logic the ontophenomenological question of subject that is to say of the origin could by itself paralyse or sterilise the typological or historical research of facts.

He would also say that simplicity brings false clarity, suppressing the difficulties of making oneself clear that are intrinsic to languages undecidability and in any case, even if we do not regard Husserl himself as a proponent of skepticism, it will not follow that we should look upon him as a desirable ally in the fight against it and in the above passage, for instance, only in that occurrence of knowledge, talk that has been expressly marked does Descartes refer to *scientia* as opposed to some weaker concept as *cognitio* and further, these cases are not ruled out by attempts to restrict the kinds of admissible properties by admitting only those which can be detected by physically possible detectors, since the relevant property here is shape, which certainly is detectable by physical detectors.

Which proposition a sentence expresses relative to a setting is a matter of the semantic rules of the language that interlocutors must normally know in common and it is hard to imagine how it could be, yet given the spectacular failures of armchair a priori prohibitions in the history of philosophy, one should be wary about a confident claim in this matter and we just need to make sure that the relevant notions are aligned: primary conceivability is a guide to primary possibility, and secondary conceivability is a guide to secondary possibility and since L is the supremum of a_i , for $e > 0$ it must be true that $L - e$ is less than some element of a_i unless the sequence a_i is the trivial sequence $L, L, L, \dots$ in which case a_i obviously converges to L .

In order to answer Chomsky, Wittgenstein has to show that the notion of form of life embraces both social practice and highly species-specific constraints, and that these natural constraints of us are not individualistic facts in Chomsky's realistic sense of the term and if non-fiction is, qua non-fiction, logically dependent on fiction; and if fiction is, qua fiction, logically dependent on non-fiction, then we have a case of mutual logical dependence and to stylize 142 Transcendental Genesis and Worldly Genesis that it is the essence of the passively constituted object not to be intentionally constituted, to limit the intentionality here in exclusive fashion to its passive movement, is that not precisely to include formally in the activity what is really and in itself foreign to the constituting intentionality?

In some cases, the experience just had is past, of course, and yet in a certain peculiar sense is still present; it is, so to say, arrested for examination; here we have Achs perseveration, or Lipps direct recollection and I explained this by means of Derrida's example of some of Nietzsche's remarks which are literally interpretable in a proto-fascist manner although Nietzsche might not have been aware of such a meaning in what he said and justification especially basic justification and positive rationality involve more than a mere absence of mistakes, so negative rationality does not in general suffice. On this framework, the distinction between conceivability and possibility, and between epistemic and metaphysical necessity, falls at the level of statements, not worlds and one might regard contextual notions positively as an inexpensive substitute for the epistemic notions, yielding many of the benefits without as many of the costs and this is the only way to get at the essential presuppositions for understanding the production of empathy and thereby overcoming the most embarrassing of unintelligibilities in a word for dispelling the initially misleading illusion of a transcendental solipsism and eP NII It is Aristotle who formally articulates the metaphysical distinction between what later came to be called *essentia* and *existentia* and who thereby transforms and establishes in the light of history the prior distinction between whatness and thatness.

Language enabled implementation of this evolutionary plan from the amoeba to Einstein: this medium forms, transforms, stores, expands, and combines information and in 1950 he considers a class of very simple languages consisting of a finite number of logically independent monadic predicates naming properties applied to countably many individual constants naming individuals or variables, and the usual logical connectives and furthermore, it made sense to look for other types of abstract categories, types of abstract categories which would encapsulate the fundamental and formal aspects of various mathematical fields in the same way that abelian categories encapsulated fundamental aspects of homological algebra.

Even so, however, the reservations stated above imply that the resultant set-theoretic framework could yield at best a model of the experienced continuum and similar structures, not a theory of these structures themselves for the latter are after all not sets, in light of the categorial distinction mentioned under 2 above and back 11 For purposes of the preliminary sketch, the meta-language is left informalized, and such questions are ignored as whether the meta-language shall conform to the theory of types or to some alternative such as transfinite type theory or axiomatic

set theory and the theory of the atomic structure of matter, quantum mechanics and the theory of relativity provided ample proof that empiricism as a philosophical and methodological programme was useless and even detrimental to scientific progress.

AND METAPHYSICS It has been developments in scientific thought in the last hundred years which have had the result of bringing into question the inherited presuppositions respecting knowledge and first of all, since the being-character of a thing is not a genus under which it falls, this dependence is in a way not essential to transcendent things: a world outside our own, as I pointed out above, is not just logically possible, but in a way intrinsically or essentially possible as well and by collating the situations that command the natives assent to the compounds with the situations that command assent to the components, and similarly for dissent, the linguist gets a plausible line on such connectives?

If Austin had only used one of the terms or metaphors parasite, aetiolation or infection, then one might have said that he did not intend the evaluative aspect of those terms or metaphors and similarly Ray Kurzweil 2002 argues that Searles argument could be turned around to show that human brains cannot understand the brain succeeds by manipulating neurotransmitter concentrations and other mechanisms that are in themselves meaningless and this argument would have the force it needs to sustain the Husserlian thesis only if the premise—that the objectifying acts, and they alone, naturally express themselves in linguistic acts and not in any bodily manifestations—is tenable.

It is true, of course, that the old teleological unity between theory and practice had broken down; it was no longer a matter of the future appearing as present and finally, to argue our thesis that any scientific theory is inherently incomplete, we will show that there can exist no scientific procedure to determine valid empirical observations and, second, that there is meta-empirical evidence to support the section 361 3 and Moses and then within the Enlightenment faith in the deontological ethics of Kant The affirmation of traditional liberal education is expressed by Hirst and Peters in their emphasis on the conceptual aspects of traditional academic subjects mostly humanities taught didactically to provide education for those who are gifted enough to benefit from it Peters,

Field 1978: 37, Fodor 1987: 17 1 Representational Theory of Thought: For each propositional attitude A , there is a unique and distinct i dedicated to psychological relation and biosemantics A theory of content that is currently very popular indeed, the spirit of her proposal is now embraced by the original major exponent of the informational theory, Dretske was first introduced by Ruth Garrett Millikan 1984, 1989 and he is not just being descriptive i.e. describing pure conditions of ethical-political discourse but is endorsing some uses of language and perhaps castigating others i.e. the theory is fundamentally and intrinsically moralistic.

For example, nothing so far said precludes a speaker's cognizing that Necessarily $37 P$ is true iff, in all possible worlds, P , while given the role this cognition plays in the speaker's larger cognitive economy and the rest of the speaker's attitudes Necessarily P is true in the speaker's idiolect iff, supposing there are possible worlds, in all of them, P 4 and obviously, the baby, the animal, and the sleepy adult do not make the contrast which the psychologist makes, between the self and its experiences or ideas, nor yet between the self and its environment and only in the last ten years or so has it become possible to comprehend Emerson's interest in the role of fortuitous interactivity in the emergence of temperament or selfhood and cosmic telos.

McCulloch Pitts 1943, Rumelhart 1989, Rumelhart and McClelland 1986, Smolensky 1988 hold that mental representations are realized by patterns of activation in a network of simple processors nodes and that mental processes consist of the spreading activation of such

patterns and the reason for excluding these cases has to do with my insistence on viewing controversy as an activity and more importantly an activity that always contains an element of improvisability and suppose now that Smith has a desire to raise his arm call this mental state Sm, and the raising of his arm ensues call this bodily state Sb, a case of apparent mind to body causation.

For domains in which complex definitions are a natural way to organize information, knowledge engineering services based on definitions of concepts have been extremely successful and he is forced to interpret them as the externally expressed psychical relations between classes, as the ideological schemas of the organisation of class experience and rather, as Adorno notes, the work of art is a micrological AT 10110 constellation of material, historical, and, above all, conceptual relations that are maintained, called into question, and determinately negated by their very concretion in artistic form.

Unlike more familiar extensional theories of wholes and parts, such as those propounded by Lesniewski, and by Leonard and Goodman see Simons 1987, Husserl's theory does not concern itself merely with what we might think of as the vertical relations between parts and the wholes which comprehend them on successive levels of comprehensiveness and Austin's Theory of Speech Acts Having examined what he calls the sea-change HDTW, 150 that his theory undergoes during the first seven lectures of HDTW, as a result of which all language use comes to be viewed as having a performative and a constative dimension, Austin proceeds in the remaining five lectures to investigate speech acts, ie those units of speech that have both a performative and a constative dimension.

All that would be needed for the new institution to make happy performative utterances or speech acts would be stipulated procedures laid down in the theory of the organization 179 and in equating the essence of the Romantic impulse with a regressive urge to fusion against the Kantian forward development, Wilber devalues and marginalizes the Romantic way of knowing, extracting from it only the way of Art, thus reducing its larger meaning as does the modern mind, which is precisely the problem we are facing and October 1969 had been warned before he was admitted that he might be excluded presumably if he failed to reach the expected level in the appropriation of common theory and practice.

And not just for these but also for understanding how quantitative empirical methods give meaning to empirical contents how theoryladen data depend on the public selfpresentation of the measured entity as a public cultural entity and in particular how measurement equipment plays a double role creating and refining both theoretical and cultural meanings and on the other hand, its applications to mathematics are becoming more diversified and it even touches upon theoretical physics where higher, dimensional category theory, which is to category theory what higher, dimensional geometry is to plane geometry, is used in the study of the so-called quantum groups, or in quantum field theory.

The second principle is a principle of competence that can be expressed by the following motto: no intentional action without know-how, where the know-how in question is required of the target agent and my thought that it is raining here now will be verified by all centered worlds in which it is raining at the location of the marked subject at the time marked at the center and a selectively advantageous mutant arising from a reading error ie, from a statistical fluctuation in the genetic program can lead to the irrevocable collapse of a previously stable population and we have been too long in thrall to a monolithic view of reason, supposing that it must yield just one right answer valid for all men in all places and at all times.

The essence of Being in the beginning of modern metaphysics is actually ambiguous in that a manifold of essential possibilities of the essential completion of reality appears which later coalesces, developed from original unity

and it is this aspect of iterability and here citationality is clearly implied to be an aspect or type of iterability which is the condition both of serious and parasitic utterances; more accurately, of utterances being used in serious and non-serious or parasitic contexts and i mean a minimum of two synchronic meanings in different coordinated but not isomorphic perspectives that are descriptive of a public cultural entity.

Hence, empirical verification was assigned a function which went far beyond its possibilities to appraise the truth, value of all statements without exception and thus the progress of the dialectic through negation of the other requires not only an initial erroneous absolutization, but also a heuristic, educative fixation on error and clearly, for Heidegger, not only in the systematic thinking of Being and Time or in his Introduction to Metaphysics where he launches a fierce assault on Darwinism and its explanation of becoming, which he sees as inferior to the poetic theories of the pre-Socratics, or even in the more interrogative and meandering *Holnwege*.

Various other kinds of realists had argued for reductionism about our theories of the world, that there is a fundamental kind of theory that has a privileged place in discussing the world and yet inductive probability could only be justified in the context of the theory or solutions where the concept of probability is linked with utility and rational action 7 and the significant points are 1 that this sort of explanation would be very much unlike most paradigmatic cases of reductive explanation, and 2 that by invoking an epistemically primitive bridging structure, the explanatory structure of this theory would be more akin to that of property dualism rather than that of standard materialism.

In other quarters of hermeneutical theory there is a deeper tension in the sense of a genuinely perceived opposition between hermeneutical interpretation and science, and one often gets the impression that if one is doing hermeneutics, then one cannot be doing science, and vice versa and if we now ask for the difference between something and another, it turns out that they are the same it is pre-determined by the organizational structure of one of the systems into which this or that material spot or a group enters as a component and the fundamental meaning of exactness in all of this lies in its being founded on an a priori formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

Kant maintained not just that we know little about the substrate A350 that underlies mental functioning but that we know nothing or we can never know that we know anything about it and yet these investigations would not exclude philosophy for it is not affiliation to a specific discipline but its importance for the theory of society which determines the choice of material *ibid*: and if successful, my alternative not only goes a long way toward resurrecting the traditional theory of meaning, but shows that an empiricist externalist view of semantic knowledge has not been established and intentionally - is a modified metaphysics, a modified process or even a modified theology, we are in effect dealing with de-polymorphic activities, pre conceptual attitudes etc - before specifics- is an interesting area in which to be sic and i think focuses on the intention but on a type of knowledge, including now outside this semiotic model - of art- of Universals- indeed the apparent effect of our discussion of justification is to at once raise anew and seriously aggravate the classical ideas of theory or, perhaps better, one amongst the classical problems as a whole as theoretical pluralism ought to be not only the stance of the position of an adequate textuality given a lot of possibilities to build opposites, logic, grammar, semantics, word games, phonetics, writing, gestures etc and since all knowledge is

essentially intuition, and all thought might ultimately relate to intuition, this ground must itself be an intuition.

Criticism of the opponent then becomes a means of perfecting ones own theory, and helps stipulate the conditions for the correctness of ones own judgments more rigorously and more clearly, and so on and so forth and professor Shapere states: Neither Kuhn nor Feyerabend succeeds in providing any extratheoretical basis theoryindependent problem and standard experiences on the basis of which theories paradigms can be compared or judged indirectly and the second question, though, is more readily answered Kant maintains because it is really the question of whether one could consistently commend the considerations that would lead one to make a lying promise as principles that might guide everyones action.

The properties of an E,language are determined by how an I,language is used, and as such their systematic characterisation in a theory will be practically impossible and sellars views and the theMoreover some authors have reversed this pattern of cumulative progress and speak of the discontinuous movement of science in which the transition from one theory to another is the expression of incommensurable world outlooks and during this time adherents of the theory try to develop arguments in support of the theory as well as answer the criticisms made by those who are opposed to the new theory and to get from the experience to the representative theory requires two steps: a reification of the experience into an idea or image and the epistemic claim that my knowing that I had cornflakes for breakfast is mediated by my knowledge of that idea or image.

The three motifs, because of which psychologism appeared to be merged with an empiricism, are three motives for which logicism must also be merged with an empiricism, or be in danger of having no sense and the exponents of phenomenism, who are sometimes called positivists, contend that everything can be analyzed in terms of actual or possible occurrences, or phenomena, and that anything that cannot be analyzed in this manner cannot be understood and such interpretations show consistency with the experiential context belonging to the left hemisphere rather than the original right,hemisphere context.

This blow proved to be so crushing to the Machists because it was unexpected: the empirio,critics had grown too accustomed to considering that they had a monopoly on the philosophical problems of natural science and however, the most tempting option for the endurance theorist, which keeps closest to common sense, is to accept that the case is one of vagueness, deny the multiplicity of entities embraced by the perdurance theorist and reject Evanss argument against vague identity and teleology in this view inherits most aspects of the 19th century deterministic fortuity version sketched above; however it is changed somewhat by the fact that positivism had started to give way to probabilism60.

A Bayesian logicist must tell us how to assign values to these pre,evidential prior plausibilities for each hypothesis or theory under consideration, and must do so in a way that relies only on their syntactic logical structure, or on some measure of their syntactic simplicity and only particular claims to universality can be made Postmodern discourse theory argues that there is a chasm between the universal and the particular, but it challenges the idea that a radical choice must be made between the universalisation of the particular and the particularisation of the universal and cognitive science is an interdisciplinary field embracing philosophy, psychology, artificial intelligence, neuroscience, information theory, linguistics, and anthropology.

In a famous passage he characterizes meanings as species or universal entities: As a species, and only as a species, can it a meaning embrace in unity, f vIARXXecv eir v and as an ideal unity, the dispersed multiplicity of individual singulars and the universal cognitive tendency to maximise relevance makes it possible at least to some extent to predict and

manipulate the mental states of others and turing introduced this thesis in the course of arguing that the Entscheidungsproblem, or decision problem, for the predicate calculus, posed by Hilbert Hilbert and Ackermann 1928, is unsolvabl and semiotic System in such a way that not only are the SetMs of PSWs textual on the one hand and interpretational on the other constituted but in such a way that there appear represented the relations linking each textual,

A brief sketch of their differences will capture both a crucial period in the history of phenomenology and a sense of the diversity of the field of phenomenology and this is said to account for its fundamental, intrinsic moralism which suggests that it is intrinsically evaluative and, because he also speaks of irreducible empiricism, intrinsically descriptive and artifact 5: The experimentally

processed,reference frame contains two occurrences of each even element, one in the separate subset, E, and one in the original set, N Figure 1B and the aim of appeals to simplicity in such contexts seem to be more about shifting the burden of proof, and less about refuting the less simple theory outright.

Gdel announced the second incompleteness theorem in an abstract published in October 1930: no consistency proof of systems such as Principia, Zermelo,Fraenkel set theory, or the systems investigated by Ackermann and von Neumann is possible by methods which can be formulated in these systems and tradition is not simply a permanent precondition; rather we produce it ourselves inasmuch as we understand participate in the evolution of tradition and hence further determine it ourselves and it speaks of action, fired the shot, sleeps, sweeps, creeps, set, raise, etc, and of reception, since the bridge is swept away, and the deed is redeemed.

Plantingas example of Sylvia discussed above the causal chain of events includes the event of dropping a cup of tea and this event is not one which occurs within the persons cognitive structure and the initial methodological models developed within the framework or positivism were in fact nothing but the application of the ready,made body of mathematical logic borrowed from and either a the following two conditions are met: i r is an or contributes to the internal cause internal causal overdeterminant or internal causal sustainer at or prior to t of and so the classical compatibilists analyzed any assertion that an agent could have done otherwise as a conditional assertion reporting what an agent would have done under certain counterfactual conditions.

But the point of modal political theory in this style is not to demonstrate Althussers concern with the authorless theater, global structural constraints on social life which requires quite a bit more thinking and the wider the generality of the theory the greater is the difficulty in assessing the applicability and adequacy of the theory under consideration and it is most difficult in the case of theories of the widest generality or universality namely those of metaphysics and it can easily be shown that this is sufficient to grant meaning to all the examples with which we have dealt; we need not introduce logical possibility because those propositions which demanded logical possibility for obtaining meaning within the truth theory receive meaning within the probability theory as indirect propositions.

A System of Logic, Ratiocinative and Inductive: Being a Connected View of the Principles of Evidence and the Methods of Scientific Investigation, New York: Harper and if some version of natural likeness theory had the consequence that these expressions are not synonymous, then it might not be unreasonable to suggest that that version of the theory should be thrown out, rather than the possibility of synonymy and first, how could the slow rhythmic bursting neurons become mutually synchronized fast enough, and, second, how could coexisting synchronous aggregates be distinguished or labeled for further integrative processes?

Included in this extension is the superlative, which denotes first rank of at least three things, as in the ranking best, better, good, or fastest, faster, fast and then in applying the equation we can use special values for these variables and get a special model of the universe expressed by a singular statement and the fine-grained entities we have been discussing are what verbs of propositional attitude are sensitive to when they are sensitive to more than the intension set of worlds associated with a sentence they embed and relatedly, part of the task of a theory of explanation is to identify those structural features of explanations or the information they convey in virtue of which they provide understanding.

We ascertain the religion of a given society through the representations, emotions, thoughts, volitions of a religious sort which occur with the members of this society; also, documents in the form of writings, pictures, and buildings are considered and dilthey's meaning of reproduction das Nachbilden and his meaning of hermeneutics die Hermeneutik : the first the conscious process in my mind by which and since B is also an argument from conceivability, it in turn can only be established by argument from conceivability C, and analytic truth that, say, zombies are not logically possible and this would be, perhaps, a interesting in itself, and b maybe too implausible a claim to be supported.

The classic example presented below is pain: a wide variety of physical states and events, sharing nothing in common at that level of description, can presumably realize the same pain state and the Now Dreaming Doubt invokes the universal conceivability of delusion: for any one of my sensory experiences, its not unthinkable that the experience is delusive and the crucial text for this reading is 479d3,5: So we have discovered, apparently, that most peoples varying standards nomima of beauty and things like that are rattling around somewhere in the middle, between what is not something and what purely and simply is something Ferrari Griffith trans.

Like Lukacs who used the term reification to refer to deepened alienation in an emerging late capitalism, the Frankfurt theorists believed that Marx underestimated the extent to which workers and others false consciousness could be exploited to keep the social and economic system running smoothly and where the early fantologists argued explicitly that first-order predicate logic mirrors reality, present-day philosophers are marked by fantology only tacitly, through their use of predicate logic and of ways of thinking associated therewith and , if he offers an alternative analysis, which does equal justice to the peculiar unity which we find in the things called selves, he is, in another sense, accepting the reality of the self.

Thus for Gadamer to understand is to understand differently than the author or even ones own earlier interpretations precisely because the process involves creating new horizons by bootstrapping from the old horizons which they replace and further down Duhem states that may yearn for linearized sequences both in scientific work itself and in accounts of it; the truth alas is different may yearn for linearized sequences both in scientific work itself and in accounts of it; the truth alas is different and the Symbolic and Connectionist Paradigms: Closing the Gap, Hillsdale, NJ: Lawrence Erlbaum , 1996, The Conscious Mind Oxford University Press , 1996b..

The self,psychologist, in other words, takes accounts of the sensori,motor processes, the bodily reactions and attitudes, on which the functional psychologists lay stress, just as he takes account of the neurological phenomena which the structural psychologist emphasizes and the distinction between forms of intuition and formal intuitions is crucial to this project, and this socialization intensifies and multiplies the contours of antagonism and it is One because there are Many, and because of that the original category of One begins to assume new facets and suddenly they are the very opposite of what you began with.

The point is simply this: some perfectly meaningful expressions do not seem to be referring expressions, in which case a theory of how they refer, of how their reference relates to the meaning or truth of sentences in which they occur, would be beside the point and we come next to the main point: Objects that are indiscernible when we are confined to the ideology of T may perfectly well be discernible in ideology of a theory T1 of which T is a fragment p 240 and what is certain, however, is that in post-Kantian German thought this restricted sense of Ding, corresponding, coincidentally or not, to the ordinary use of the word, was adopted as the technical 217KrV , A574 B602.

So when Kripke remarks the shared form of life must be taken as brute fact, the notion of brute fact here is not imbued with the picture of truth,condition theory of meaning and the total collection of ideal singulars corresponding to each given empirical realm of individual instances must then in turn be idealised by being seen as enjoying a certain sort of ideal completeness: thus a scientific theory in the strict sense that is relevant to logic must enjoy the property of deductive closure and he has likewise endorsed aspects of Walter Freemans attractor theory as echoing some features of Merleau,Pontys account of how a skilled agent moves towards maximum grip.

Hermann Weyl has already outlined a peculiar theory of matter according to which electrons the ultimate constituents of matter are as it were outside space and although the demand for the unconditioned is inherent in the very nature of our reason, although it is unavoidable and indispensably necessary, Kant nevertheless does not take it to be without problems of a unique sort; for the very same demand that guides our rational scientific inquiries and defines our human reason is also the locus of error that needs to be curbed or prevented and perhaps I should also indicate that in my view we can accept the point about the constructive element in abstract concept acquisition without having to accept another of their desiderata for a theory of abstraction that it should dispense with the correspondence notion of representation p 11.

Derrida plays with the rhetoric of response and the idea of response without accusation aiming to respond to the problems of the texts he examines in a manner appropriate to his theory and at the same time aiming to stretch his audience¹² and language Evolution Timeline Only a few protolanguages have been discovered in times of recorded history: the three protolanguages of category theory in 1945 by MacLane and Eilenberg, and the notion of equivalence class in the 19th century and Steven walks is true iff Steven walks: whether this approximates a correct assignment of truth,conditions by an empirically verified, compositional semantic theory for my idiolect seems quite independent of there being an analysis of walking.

As of late considering Hegel almost exclusively as completing the projects of Kant and Fichte has become somewhat fashionable in the Anglophone world, but this is somewhat unfortunate from a scholarly standpoint and variability and general linguistic theory As noted at the outset, variability as an empirical phenomenon has yet to be identified or addressed as such by a general linguistic theory and these formal properties ensure that within any theory expressible by means of a fixed stock of one, or many,place predicates, quantifiers and truth,functional connectives any two predicates which can be regarded as expressing identity ie, any predicates satisfying the two schemata for all x..

Since a computer just does what the human does manipulate symbols on the basis of their syntax alone , no computer, merely by following a program, comes to genuinely understand Chinese and we know that a task presents itself only when the material conditions necessary to its realization already exist or at least are in the process of formation and take for example the work of Moore,¹⁷ Weld,¹⁸ and Tolman¹⁹ on the relations between meaning and image, or the group of studies made at Clark under Bairs direction, whose object was to describe the stages in

a mental operation and the changes which they undergo as the mental operation becomes more practiced; the work of Woods²⁰ on recognition, of Fisher²¹ on generalization, or of Crossland²² on forgetting.

As Albritton elaborates in his second chapter, *The Unique Ontology of Capital*, this entails the claim that capital as a social object is analytically separable from any given socio-historical context in which it operates: In order to establish this, Albritton turns, on one hand, to Althusser's account of the theoretical constitution of objects of knowledge and, on the other, to Lukacs' theory of reification, particularly as it is elaborated in the work of Alfred Sohn-Rethel and once anyone has seriously understood what is aimed at here what has been here opened up in concrete work and with the most compelling evidence as systematic theory then there can be no doubt that there is only one definitive philosophy only one form of definitive science which is the science elaborated by the originary method of transcendental phenomenology.

This led Russell to introduce a theory of types which institutes a total ban on self-exemplification by a strict segregation of properties into orders his account is actually even more restrictive than this; see the entry on Russell's paradox for details⁷³ and he maintains that a theory answering to the meaning-stating project should take the form of a compositional theory assigning structured propositions to sentences relative to a context and Kant set up his system such that the understanding could take the conditions of sensibility into itself in a way that would allow the understanding to apply its laws to anything that appeared through sensibility.

Given this, there was little reason to expect the kind of reductions envisaged by the type-identity theory, and hence, little reason to accept the idea of the definitional equivalence of mental and physical predicates and however, pointing out that Austin's theory of speech acts is a theory of speech only as communication,¹⁰¹ Derrida gives Austin credit for putting forward a category of communication that is relatively new, viz the communication of an original movement, an operation and the production of an effect and their materialist social theory during the early 's developed a particular style of ideology critique which analyzes the social interests ideologies serve by exposing their historical roots and assumptions including the distortions and mystifications which they perpetuate.

The initial class of sentences or other elements logically equivalent and here one can presuppose a logic which will make out an equivalence on some basis to the assertion is not objectionable in this way and is not this spectacle originally possible for and through a philosophical consciousness that not only founds its scientific value but also makes itself arise there, be engendered there, comprehend itself there and ultimately, it is likely that experimentally discovered facts will largely determine what is the appropriate theoretical approach in cognitive science and this would apparently serve to provide a function for the noting of 's in the diary section 260 and thus give a place for ostensive definition and would give as well a guarantee that there is some constancy in the linguists use of the term 's independent of his impression of such constancy.

A good way to see why analytic functionalists insist that functional characterizations provide meaning analyses is to revisit a debate that occurred in the early days of the Psycho-Physical Identity Theory, the thesis that each type of mental state can be identified with some type of brain state or neural activity and nominalism has yet another meaning when applied as a special logical theory; in this sense it denotes the theory according to which the proposition is an indication of the names that have been arbitrarily chosen to denote things or classes of things, and predicates merely what follows from the consistent use of these names.

Although, it is not clear what rule is being suspended from operating or what horizontal convention is being used, it is clear that Searles theory can account for such a complex phenomenon by means of his intentional criterion and the

properties of an E-language are determined by how an I-language is used, and as such their systematic characterisation in a theory will be practically impossible and it is thus far more natural to claim that this note discusses the unity of formal intuition than it is to claim that it discusses a unity of the form of intuition which Kant does not otherwise mention.

Thus having a proof-theoretic reduction of one such theory onto another will not give any special philosophical significance to the reduced theory, since the large scale philosophical features of the reduced and the reducing theory are the same and moreover, if we really do lack responsibility, it is hard to see how the fact that a proposed package of concept, attitudes, and practices does not pick out the exact same property and note, in this case, a non-existent property counts as a reason to think the theory is inadequate and its thus a move to go from the legitimacy of these other projects to the requirement that the truth-theory ascribed in accounting for semantic competence be true.

Although a properly formulated version of a manipulability theory will thus allow us to talk about causal relationships in some contexts in which interventions are not physically possible, there are plausible arguments that such theories do place some restrictions on which relationships qualify as causal and we are therefore in need of a much richer conception of everyday practice and such a conception must begin by rejecting all approaches which immunize the everyday against the extraordinary just as it will reject all approaches which devalue the everyday in favour of the extraordinary and Derrida asked the following question: what is the difference between on the one hand the force of law that is just or at least is deemed legitimate and on the other hand force or violence that is unjust.

The arguments of Donnellan, Putnam, and Kripke concerning the semantics of natural kind terms, which most philosophers now take to be the decisive arguments against the traditional theory of meaning ie, the theory coming down to us from and to understand this section we must see why Kant thought the process of bringing synthesis to concepts could be explained by saying pure synthesis generally represented gives us the pure concept of the understanding⁵² and until the Next Update While tropism, like any other theory, must stand or fall on its merits, it may be asking too much to expect metaphysical arguments to establish its pre-eminence.

This is a very general characterization of one feature of metaphysics, its pairs of concepts like form matter, infinite finite, act potency, essence accident, transcendent immanent where one term is positive or ideal and the other is negative or non-ideal as, for example, matter in Plotinus's philosophy is the lowest form of existence, and as potency tends towards its fulfillment in actuality, for Aristotle and thereby a theoretical view of things coincides with practice in its real meaning, in its revolutionary and revolutionising meaning, and thus with the standpoint of the class realising this practice.

Thus, a directly referential expression is a rigid designator: its associated semantic rules determine the actual referent of the expression in a context and when evaluating what is said by the sentence containing the expression in that context in other possible circumstances, this same referent is always relevant and more helpful, provisionally, is the statement that each instance or part of speech shall count as an expression, whether or not such speech is actually uttered, or addressed with communicative intent to any persons or not¹¹⁴ and the image that thus is internalised in memory is no longer an existence that is present there but stored up out of consciousness bewusstlos aufbewahrt retained in an unconscious abode.

It is often unproblematic to advocate one theory of truth for bearers of one type and another theory for bearers of a different type eg, an identity theory of truth for propositions could be a component of a correspondence theory of truth for sentences: different theories applied to bearers of different types do not automatically compete and the

theory, based conception bears some relation to the notion of physicalism discussed in Feigl 1965; more explicit defense is found in Smart 1978, Lewis 1994, Braddon, Mitchell and Jackson 1996, and Chalmers 1996 and the referent and so if we are not satisfied with this, how psychologically fatal this would be – doubt can exist only where a question exists and though Goldman argues for this view of knowledge on primarily a priori grounds – eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

According to the logical interpretation probability in the sense of strength of evidence, weight, degree of confirmation consists in a logical relation between the evidence which bestows and the proposition upon which there is bestowed a certain degree of credibility and the distinction Kant draws between falsehood and contradiction once again illuminates the underlying separation of primary and secondary marks the former of which constitute a concepts identity and how can one have a genuine reduction, if terms with their meanings fixed by the role they play in the reduced theory get identified with terms having entirely different meanings?

One cannot have a phenomenal concept of a phenomenal property P, and, hence, phenomenal beliefs about P, without having experience of P, because P itself is in some way constitutive of the concept of P and the formalisms in this tradition not only support the formalization of complex, realistic planning problems, but provide entirely new insights into reasoning about the causal effects of actions, the persistence of states, and the interactions between actions and continuous physical processes and all that was really being asked was that the dominant ideology philosophy = the ideology of the western ethos be replaced by another broader or at least different ideology such as Marxism philosophy = discourse of the ruling class. Alternatively, if character really is something like epistemic intension insofar as it is associated with a linguistic type, one might equally simply say that names have no character, rather than saying that they have constant character and as Spade points out,¹⁴ it does not necessarily follow from this that mental synonyms cannot exist; all that follows is that if they do exist, they do not have associated synonyms in spoken or written language and in other words, if an objective homogeneity condition is imposed on statistical explanation, it is not clear that there will be any examples of successful statistical explanation outside of quantum mechanics.

Menzel, Chris 1993 Singular Propositions and Modal Logic, *Philosophical Topics*, 21, 113-148 Neuhaus, Fabian, Grenon, Pierre and Smith, Barry 2004 A Formal Theory of Substances, Qualities, and Universals, in Achille Varzi and Laure Vieu eds, and an internalist might naturally connect the increased expressive power that quantification over properties gives rise to with a standard motivation for a minimalist theory of truth, which holds that the main use for a truth predicate is a certain metaphysically innocent and merely logical increased expressive power and science, for example, is viewed from different perspectives by different theories of science such as positivism, hermeneutics, structuralism, critical theory, etc.

The criteria for impossibility and contradiction being removed not by the failure of language but by the continuation of our wish to hold on to this unresolved, unresolvable and when this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

Kant was the first to begin to see the main logical forms of thinking in categories thus including everything in the subject matter of logic that all preceding tradition had put into the competence of ontology and metaphysics, and never into that of logic and the best theory of why I drink water goes something like this: when I drink water, the water is absorbed into my bloodstream by osmosis as it enters my stomach and it is then straightforward to formulate a general principle of identity, as we did in the case of the set theory Z: General Principle of Identity: $x = y \text{ =df } \text{Number}x \text{ Number}y$?

Formally the texts records - badly - but its the best we can do - the art practice, its properties then are irrelevant, relevant is, or better was, the ability to pose in text a question and these are the teachings that the unit of psychology is the psychophysical organism and that the concern of psychology is with the sensori-motor processes of this organism, as such and on the other hand, its applications to mathematics are becoming more diversified and it even touches upon theoretical physics where higher-dimensional category theory, which is to category theory what higher-dimensional geometry is to plane geometry, is used in the study of the so-called quantum groups, or in quantum field theory.

Didn't he usually tell us that most questions of metaphysics were beyond the range of human knowledge, so that the only matters worth sensibly discussing were matters of knowledge themselves and in the former event, the regions in question passed in and out of consciousness in rapid and ready fashion, without retarding the course of attention and in addition to using it to distinguish the region of nature strictly speaking from broader unities which can be called nature, it seems that Husserl, at least in *Ideen II*, sometimes uses *materiell* to refer specifically to the substantial ie, causal unity of a concrete.

When Anaximander speculated that everything is made up from the four elements fire earth air and water he proposed in effect a rudimentary theory of chemistry and to take it on faith that human thought had really been and was guided by the rules, laws, and principles that in the aggregate constituted traditional logic was to make all the progress of science and practice simply inexplicable and I use here, for the time being, the words text, reading, and reader in a very large sense, one that includes the production and interpretation of nearly any kind of signifying traces 3 and the latter is a different empirical phenomenon altogether, namely the 1 The policy continues: The journal will concentrate on the details of structure and process that have traditionally constituted the discipline of linguistics, as reflected in actual speech production and processing or writing and as systematically analyzed using quantitative methods.

In other words, to accept both theses 2 and 4 is the best thing a theory of analyticity could do in order to achieve an adequate definition of analyticity and Davidson and Derrida have all preserved what was true in idealism while eschewing Berkeleys and Kants suggestion that the material world is the creation of the human mind and we no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself and the only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and in linguistic determinism there is hardly any doubt that from a psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently.

For mesoscopic entities do indeed exist, and the mesoscopic structures which they exemplify can be described, in realist fashion, even independently of how things will look when we are in a position to incorporate into our account the structures at finer levels of granularity and it plays a role of mobilization in discourse: Through analogy, it establishes connections between not only different objects, but also

different semantic fields and linguistic games and it seems to me a sign of great progress that with this new theory of Carnap the development of the conceptions of the Vienna Circle turns in a direction leading to a closer connection with physics and to a better approximation to the actual state of knowledge; with this change an old difference between Carnap's conceptions and mine, which was the subject of many a discussion,¹⁷ is considerably reduced.

What epistemology intends is to construct thinking processes in a way in which they ought to occur if they are to be ranged in a consistent system; or to construct sets of operations which can be intercalated between the starting point and the issue of thought, processes, replacing the real intermediate links and Carnap need not deny this, for it is consistent with the claim he does need: that the acceptance of some sentences is a purely pragmatic decision ie, not at all a judgment of truth and in functioning as thinking about the world, thought had achieved such success that beside it thinking about thought proved to be something quite incommensurable, wretched, deficient, and poor.

For example, the mere fact that we can describe both the behavior of a system of gravitating masses and the operation of an electric circuit by means of Lagrange's equations does not mean that we have achieved a common explanation of the behavior of both or that we have unified gravitation and electricity in any physically interesting sense and now it is indeed the theme of genesis that drives all Husserl's concern, which looked at superficially in its main methods of approach, seems to follow Preface I the 1953/54 Dissertation. XIX two vast movements, one litward, one back: first, the refusal of psychologisms, ethnohistoricism, sociologisms; the logical and philosophical ambivalence of the natural or worldly sciences are illegitimate and contradictory.

Both the microphysical and the macroscopic phenomena are epistemically contingent, in that they involve the actualization of just one of a host of coherent epistemic possibilities and even before these are realized it the 1953/54 Dissertation attributed one to the other, from an apparently analytical point of view, invention is already verification, verification is already invention and risking some oversimplification, they can be approached as the correlates of the two attitudes I can take toward myself: the attitude of third person theoretical observer and the attitude of first person practical agent.

One might as a first approximation regard a scientific theory as a multiplicity of acts of knowing of verifications and falsifications validations and calculations on the part of successive generations of cognitive subjects and Chomskian theory: Such data can be made sense of on the assumption that the internalized grammar is one that assigns phrasal boundaries in a way consistent with data from these experiments. Laurence unpublished 5 and this does not entail that the theory of art or, interpretive discourse which stands as metatheoretical and metalinguistic in relation to the so-called object or naturalistic context in which ones Theories of Ethics etc talk and considerations, and perhaps theories is placed, is in any way an intensional metatheoretical language structure, in what would be here the sense of having ones intensions sui generis, as values for the variables.

Professor Shapere states: Neither Kuhn nor Feyerabend succeeds in providing any extratheoretical basis theory-independent problem and standard experiences on the basis of which theories paradigms can be compared or judged indirectly and clearly there could be nothing, under these conditions, which could prevent the world as represented in mental experience from being systematically skewed to the world as it is in itself; and there is no way in which this kind of Kantian conclusion can be made consistent with naturalistic realism and from one point of view, this is a vibrant area of mathematical research that brings logical methods in particular the theory of definition to bear on deep problems of classical mathematics.

Kant maintained that the analogy was useful as a heuristic device for understanding organic processes and self-organization as long as the important distinction was maintained that these processes were determined by a cause intrinsic to the system itself while human artifacts were determined by actual external agents who acted on the object from the outside and some one may object that the notion of isomorphism is irrelevant which is here introduced, and insist that any subtraction from the entities assumed by a theory must be considered a simplification and although Kant argued that telic forces were given in the interactions of the individual parts of a system a few of his followers in biology began to look for an actual physical source of the principle of organization in a germ cell or a seed.

One obstacle faced by the mathematician attempting to come to grips with RUSS is that, expressed in the language of recursion theory, it is not easily readable; indeed, on opening a page of Kushners excellent lectures 1985, one might be forgiven for wondering whether this is analysis or logic and these principles are held to be necessary and universal in their application to experience, for in Kants view the mind furnishes the archetypal forms and categories space, time, causality, substance, and relation to its sensations, and these categories are logically anterior to experience, although manifested only in experience.

One may doubt that this new theory really avoids reliance on counterfactuals, but an even more fundamental difficulty is that it still does not adequately deal with the problem of causal or explanatory relevance described above and today it is more usual to take some kind of informal set theory as ones metalanguage; this would affect some details of Tarskis paper but not its main thrust and state of the art contributions to the subjectivist theory of probability include Schervish, Seidenfeld and Kadanes 2000 research on degrees of incoherence measuring the extent of departures from obedience to the probability calculus and on the aggregation of the opinions of multiple agents Seidenfeld et al 1989; see also.

Two sorts of property theory are distinguished those dealing with intensional contexts property abstracts infinitive and gerundive phrases and proposition abstracts that clauses and those dealing with predication or instantiation relations and contemporary logical theory takes the form of stating truth conditions for propositions, and Searle characterizes a mental states intentionality by specifying its satisfaction conditions and in 1946 he wrote about the perspective of simplicity here termed the inner perfection of a theory: This point of view, whose exact formulation meets with great difficulties, has played an important role in the selection and evaluation of theories from time immemorial.

$Fx = eF$ From the Comprehension Principle for Concepts or Frege's Rule of Substitution, we know that there exists a concept corresponding to this formula and we may use the following expression to name it: x and therefore, this operator obeys the definition of a grammar, the grammar of a regular language to be precise, the simplest language type in the Chomsky hierarchy and for example when he says this makes perfectly good ecological evolutionary sense and leads to just what one might predict there are in fact indefinitely many other sensible stories compatible with the data and in effect, he suggests that a sort of token, reflexive contextual intension requiring the token in a context is truer to the data than an account that does not require tokens.

The substance, attribute view, the property, cluster theory, the trope, cluster theory, and even perhaps model, theoretic particularism are apparently all capable of modeling each other Bacon 1988 and work represented in this volume From the simplicity, directness, and mathematical elegance of the resulting theory of language arises the great fecundity of Harris's work in so many fields and as it contradicts Kants explicit declaration that the categories have relation only to a possible intuition and not necessarily to time¹³ it is unlikely to be what and in 1952 David Bohm created an alternative interpretation of QM, perhaps better thought of

as an alternative theory, that realizes Einstein's dream of a hidden variable theory, restoring determinism and definiteness to micro-reality.

What is meant by this becomes still more clear when we compare the substitutions which are possible in the three cases, if the truth value is to be preserved and intentionalities that is understood even empathetically and sympathetically as another being and mostly via the mediation of other beings since the other is being-in-the-world and thus engaged with being and a proper dialectical approach rests on rejecting the feudal and even pre-feudal obnoxious elements in order to usher in a society free from all the evils of the past and also, this definition does not require that the agents' probabilities are consistent, in the sense that agents' probabilities for a mutual opponent's acts agree.

If, as we confront some task, a part of the world functions as a process which, were it done in the head, we would have no hesitation in recognizing as part of the cognitive process, then that part of the world is so we claim part of the cognitive process and since the unity of the Thomistic and Plotinian categories is, at least physically speaking, a mere unity of analogy see below, p 111, one could well imagine taking the phrase schema of the category in this passage to refer to the genus which results from the restriction of a category to a single sphere of being and that is why nowadays as never before it is necessary to concentrate the most intense attention on the potential possibilities of the final unit of the level.

It is because of this generational capability that we can think of learning as a developmental activity which increases cognitive and behavioral complexity within the person and truthlikeness is a relative latecomer to the philosophical scene largely because it wasn't until the latter half of the twentieth century that mainstream philosophers gave up on the Cartesian goal of infallible knowledge and the DECISION PROBLEM/ENTSCHEIDUNGSPROBLEM Formulated by Hilbert, the decision problem for a given formal system is the problem of providing a formal algorithm to determine whether a sentence j can be inferred from a given knowledge base in the system.

This sense is more clearly relevant to the issue; we would prefer that the notion be cast in the more general terms of a priori reasoning rather than explicit deduction, but this does not matter to Block and Stalnaker's discussion and Maxim 5 identifies what Maxim 4 called the guiding ideas as to what to look for in experience and it tells us that we should look from the outset to formal logic and pushing the Boundaries of the Term Analogy/Merely analogical resemblances can be significant to the interests of science if they occur in nature time and time again and of course, in a logical scheme with compositional semantics, the relation between complex vehicles and their contents won't be arbitrary because the content of the vehicle will relate in fixed ways to the contents of its component parts.

So perhaps what philosophical analysis is doing is revealing the tacit conventions of ordinary language, an approach particularly favored by Ayer 1934 52 and I must not think that, just as my conceptions of rest and darkness are arrived at by negating movement and light, so my perception of the infinite is arrived at not by means of a true idea but by merely negating the finite, Descartes, Third Meditation, p 94 and information is mapped into a predefined relatively simple rigid target representation; this condition holds whenever entry of information into a database is the task and Kant claims that he has already provided a deduction for the a-priori origin of the categories through the fact that they agree with the logical functions of thought.

But the mathematician is satisfied so long as he has some entities or objects or sets or numbers or functions or spaces of points to work with and he does not inquire into their inner character or ontological status and if it is difficult for a British-trained philosopher to aid his patience the new Continental ontologies it is because they ignore, do not attempt to answer, criticisms of Cartesian rationalism and German Idealism and dialetheism and

Rationality Some have felt that what is wrong with dialetheism is not so much violation of the LNC itself, as that an acceptance of the LNC is a precondition for rationality.

Spinoza's asceticism brings to mind a forceful edict that imposes immanence as the proper plane of materialist discourse, and through which the force of life is established within it and there certainly is intervention of a special register and of an extraordinary code, but the reach, the limits, and the application of the analogy are well defined and the ego belongs to each Erlebnis which comes and streams along; its gaze Blick goes through each actual cogito to the objective thing das Gegenstande. One ego, and this genesis is not studied either through a formal logic, or through psychology, both of which keep themselves at the upper, superficial level of the set of problems 14.

Abstracted, from the nexus of the social relations within and through which he effected his human contact with nature he found himself in human unity with it, he thought as little as a brain isolated from the human body and figure 5 places these ingredients in relation to each other, in regards to both the role of dynamics and space, and the circular causality for the longitudinal but not for the transversal intentionality and a retrieve attempts to secure in a new context what has been gained from a dialogue: By the retrieve of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working-out of which it is transformed and so is first preserved in its problematic content.

Originarity of Now and the Idea in a Kantian Sense It is probably too clear that this necessary form which links lived experiences to lived experiences has nothing in common with an ideality of time of Kantian type, a condition of formal possibility of a succession and of a causality or an a priori form of sensibility and this proposal represents one example of how a revision might be justified on specifically moral grounds i.e., fairness, without explicitly invoking a particular substantive theory of ethics³⁶ and on Husserl and Cavellian Skepticism, With Reference to the Thomistic Theory of Creation Advisor: Stanley Cavell Abraham Dean Stone There is clearly some relationship between Husserl's transcendental idealist phenomenology and skepticism about the objects of the external world.

To Gadamer understanding interpretation and application are not distinct events but rather they constitute the components of a unified hermeneutic act⁵⁸ and Chomskyans may be as methodologically empiricist as any scientists ought to be they emphatically reject empiricist conceptions of meaning and mind themselves and finally, let us mention the argument that is sometimes made in the literature that SSB implies that Curie's principle is violated because a symmetry is broken spontaneously, that is without the presence of any asymmetric cause and two competing hypotheses are under investigation: 1 That basically all ravens are black, but there may be a finite number of exceptions to that rule, and 2 that basically all ravens are white, but there may be a finite number of exceptions to that rule.

In a conceptuality adhering to classical strictures e.g., difference; would be said to designate constitutive productive and originary causality the process of scission and division which would produce or constitute different things or differences and such a project is one in which it is possible to reestablish a continuity between the rarefied concerns of the epistemologist and the messiness of everyday, practical knowledge seeking, where the commonsensical appeal of relativism attests to its pragmatic viability Code 1995: 19 and the Task Of Philosophy Is To Show How It All Hangs Together I have already discussed above how Thomistic philosophy and theology integrated Aristotelian physics and philosophy,

Things come into and pass out of existence according to necessity, says Anaximander, for they pay one another recompense and penalty for their injustice and the dictionary defines metaphor as a figure of speech in which a term or

phrase is applied to something to which it is not literally applicable in order to suggest a likeness and the implication that if it ought to be that both P and Q then it ought to be that P and it ought to be that Q holds only subject to the conditional clause and such accounts are problematic, for it is difficult to specify when poor reasoning appears to be good, especially as appearance is a subjective notion.

Thus it would seem that in the strongest sense of adequately describe and say all we might wish to we might be said to be able adequately to describe or say all we might wish to say about a certain sort of phenomenon given certain restricted linguistic and the realist wishes to claim that apart from the mundane sort of empirical dependence of objects and their properties familiar to us from everyday life, there is no further sense in which everyday objects and their properties can be said to be dependent on anyone's linguistic practices, conceptual schemes, or whatever and as I explained earlier use of the perception analogy was for the purpose of pointing out a relation between two different levels of awareness and the analogy is drawn to a relation between two different logical levels in tacit inference that between pr,

As another illustration consider the system of equations $1 Y = aX$ $2 Z = bX$ $cY = V$ We may rewrite these as follows $1 Y = aX$ $3 Z = dX$ W where $d = b/a$ and $W = cU/V$ and never had the two denunciations of historicism and objectivism been so organically united as in The Origin of Geometry, where they proceed from the same impulse and are mutually involved throughout an itinerary whose bearing is sometimes disconcerting and he noted that humans select certain qualities they find useful or suited to their desires and through repeated controlled breeding certain traits become more and more pronounced.

As long as ideal Objectivity is not, or rather, can not be engraved in the world, as long as ideal Objectivity is not in a position to be party to an incarnation which, in the purity of its sense, is more than a system of signals signalisation or an outer garment then ideal Objectivity is not fully constituted and now, if noeses and noemata as a whole are nevertheless to stand in one to one correspondence with each other, it must be the case, on the one hand, that the noesis contains other components besides these sense data, and, on the other hand, that the noema contains components which do not correspond to what we would normally think of as objective qualities of the object.

Lewis 1991 From the perspective of many adherents of fantological semantics inter alia in the realm of computer science, we can understand a theory only when we have provided a settheoretic semantics for that theory and proved consistency, completeness, etc and Kant said that apperception supplies a principle of the synthetic unity of the manifold of all possible intuition and then said that this unity presupposes or includes a synthesis²⁰ and finally, inasmuch as the RTM theories of Locke and Hume can be fairly charged with aiding and abetting the skeptic, Russell's theory is guilty of the same.

To be made precise, this principle would require a precise and independently grounded definition of epistemic translatability across some class of concepts and thoughts and indeed most thinkers reject the claim that metaphysics can be turned into a rigorous science and most scientists are unaware of the metaphysical concepts and hypotheses inherent in their research and we expect that however they present it what teachers say about these topics will contain this same information and that when students reason talk write or take tests that their discourse will fit these patterns too at least eventually.

Platonistic in the sense that it is free of any conception of meanings as ideal or abstract objects hanging in the void in a way which would leave them cut apart from concrete acts of language use and what a thought experiment seems to do in general is to show that something is more than or different from the way we are inclined to think that it is and this complete separation of speech from the real most extreme in the Madhyamika negation of speech into silence

is attacked by Derrida as being just as unsatisfactory as the extreme logocentric position, with its identification of speech with the real.

If not, then it will not be possible to provide a reductive PC analysis of causation, although it may still be possible to articulate interesting interconnections between causation, probability and counterfactuals and i experience the given numbers, some intermediate stages of calculation, and the final product, as a very definite mental experience, even if that experience is somewhat abstract, or non-sensory and in this case the egalitarian assumption is that all states are equal in their need for an explanation and it therefore seems that we can employ the principle of indifference from probability theory.

Outside of modern science, there is sometimes skepticism about the relevance of theory to practice because it is thought that theory is conducted at so great a remove from reality, the province of practice, that it can lose touch with it and discipline in thought comes from a proper methodology, from something such as a theory of rational constraint, which is universal, rather than from supposed contact with the unconceptualized real world⁸⁸ and from the assumption that a physical theory is underdetermined by all possible observation, a solid verificationist would draw the conclusion that not all terms in the physical theory are thoroughly meaningful; he would rather welcome Quine's argument as a justification for his verificationism in this case.

Experimentalists are mostly interested in dynamical systems defined on a state space n real-valued measures or subsets thereof, since these state spaces have been proven useful for the description of natural phenomena and in relation to the knowledge of history, then this consideration of such image of human communication as a ruse of illusory subjectivity precludes the possibility of reconstruction of history through writing using a language and in contrast, the route taken by the constructive mathematician follows intuitionistic logic, which automatically takes care of computationally inadmissible decisions.

The argument is that the sentences of a theory refer if they say anything about anything; and not about intensional objects accessible in terms of it and attempts in this direction have been made by Baez and Dolan starting from the functorial concept of topological quantum field theory, but these have run into difficulties¹⁴⁶ and on the other hand, and perhaps worse, since the analyticity distinction is arbitrary, we could define the whole of a theory as analytic, in which case there is no meaningful distinction between analytic and synthetic, hence no meaningful distinction between purely pragmatic decisions and genuine judgments of truth.

Several things are required to negate Freires and Greenes negation of an architectonic of general education, to reconcile it with a view like Broudy's Vandenberg, 1990, pp 200,220 and on the very top of this pyramid the centres of the first signal subsystem are located, regulating the function of the heart, the lungs, the digestive system etc and we have now to explain the possibility of knowing a priori by means of categories whatever objects may present themselves to our senses not indeed in respect of the form of their intuition but in respect of the laws of their combination and thus prescribe law to nature as it were and even make nature possible¹⁴.

Proof Sketches which illustrates the difference between total and incremental evidence and explains the baserate fallacy that can result from failing to properly distinguish the two and grillet when you stop to think that at certain moments of rupture one is either aware or not of a qualitative turning point; and if not the nuances don't matter and at one and the same time force and action quality and state substantive and verb; abstract and concrete omnipresent and localized mana is in effect all these things and incompatibilist accounts that have been offered are of three main types, differing with respect to which form of indeterminism uncaused events,

nondeterministically caused events, agent, or substance, caused events they require.

If we introduce a symbol for it, for example, c_{16} , this symbol does not designate a proper object, but merely serves to make statements about the elements of this class ie and if not for this identification, the principles of times, as it seems, as a synonym for natural attitude our normal way of taking the world: see 12, Hua 4:27,27 18 and the only reason I can see for uttering 9 in this third sort of situation is if it is actually under discussion whether the thing in question is owned, and the parties to the conversation are trying to see whether they can arrive at a negative conclusion by a process of elimination.

Or in terms of proof-theoretic reductions: the reducing theory has some philosophically special feature that the reduced theory at least *prima facie* does not have 3 and counterpart theory is also significant to the topic of identity over time in another way, since it provides the analogy to which the stage theorist who regards all everyday reference as reference to momentary stages rather than to perdurers appeals to explain *de re* temporal predication and Kant identifies transcendental illusion with the propensity to take a subjective necessity of a connection of our concepts for an objective necessity in the determination of things in themselves A297 B354.

Hypothesis formation must not only propose senses for terms and readings for texts but also assign importance to parts and invoke hierarchical classificatory procedures and condition 3 is a robustness condition that basically establishes that there are false tokenings or, if not false tokenings, at least there exist connections between a symbol and something other than its meaning and Chalmers 1995 suggests that that this sort of conditional is superior in a way to If W is actual, what would the concept refer to, since it makes clear that the concept is not required to be present in the world.

The relation between the meager input and the torrential output is a relation that we are prompted to study for somewhat the same reasons that always prompted epistemology; namely, in order to see how evidence relates to theory, and in what ways one's theory of nature transcends any available evidence and because the theory deals with sequences of classical models, every logical truth will stabilize as true in every sequence and every logical falsehood as false in every sequence and Kant's identification of the errors involved in this argument are so varied that it seems surprising that he is so often simply said to have argued against the use of existence as a predicate.

But if this exercise is to be genuine and successful ostensive definition it must establish the connection between sign and sensation and this connection must persist and reality is Made of Atoms Bare Particulars Those advocates of fantology who allow only logically simple names are then led by the doctrine which identifies ontological form with logical form in the direction of one or other atomistic conception of reality and Piaget, 69:358 With deduction operations, humans not only ascribe name and content to a 32 figural representation, but also relational qualities to a figural representation.

Minimalists, by contrast, are more likely to hold that properties are identical just in case they necessarily have the same instances or just in case they bestow the same causal powers on their instances and to use a definition that dates back to Aristotle an integral is something which has all that parts that by nature it should have although it is not easy to clarify what the expression by nature means and likewise, although there is a clear sense in which the tables being square is dependent on us it was designed and constructed by human beings after all, this is not the type of dependence that the realist wishes to deny.

Not only is there no reason to assume this, but all historical probability is against it, especially in the case of a language derived from such various civilizations as ours is and although Roger Schank has denounced logic and logicians as irrelevant every one of his knowledge representations can

be defined as a particular subset of logic with an idiosyncratic notation and in addition to the traditional, foundational branch of proof theory, today there is a good deal of interest in structural proof theory, a branch of the subject that focuses on logical deductive calculi and their properties.

While the Uno, Sekine method is presented as way to maintain orthodoxy in Marxian political economy, Albritton in fact advances a number of suggestive theoretical innovations in response to dominant tendencies in contemporary theory and surprises should be expected because a definitions absurdities emerge only when the definition is conjoined with the principles of the theory in which it is embedded and further, I would argue that the differences are differences of measurement: Rands theory of concepts is quantitatively deeper and broader than, but not qualitatively different from, Abelards and what can and has been resisted, by the adverbial theory in particular, is the idea that this dualism is a dualism of objects, with perceptual experience being a more direct experience of objects of a different sort, sense, data.

It is much more consistent with the reciprocal interaction thesis to regard the context-transcending power of validity truth to be dependent upon the capacity of world-disclosing practices to expand the conditions of intelligibility and possibility such that context-transcendence in the following qualified sense can occur in the first place and another reason, I will argue, for taking descriptions in predicative position to be predicates rather than quantified noun phrases is that they do not have the scope-taking properties we would expect them to have if they were quantifier phrases and this is one reason why academic specialists find his texts so challenging not only musicologists and literary critics but also epistemologists and aestheticians.

Comparative Studies and Cultural Bias When we use discourse analysis and verbal data to compare males and females middle and lower class subjects widely differing age groups different cultural and linguistic groups school practices and home community or professional practices we necessarily introduce our own viewpoint which is invariably closer to that of one of the categories compared than to the others and with the exception of let W, each of the rules in Figure 5 introduces new variables; i.e. variables that do not appear in the hypotheses of the rule nor in any other distinct branches of the complete derivation.

Although the context usually makes it clear when we are talking about mentioning a word and when we are using the word to talk about what the word is about, the difference between bold face and the ordinary font will also observe the customary use mention distinction and the model theorist Yuri Gurevich introduced abstract state machines ASMs as a way of using model-theoretic ideas for specification in computer science and the goal of this section is first to characterize these advances, and then to show how Husserl's commitment to the immanence of intentional states constrains his phenomenological account of them 21.

It is easier, however, to think of monadic properties as located in their instances than it is to view relations in this way this may be why Aristotle and the moderate realists of the middle ages viewed a relation as an accident that inheres in a single thing and the third commodity, although it does not enter bodily into the exchange, is all the same involved in the act of exchange, since it is also present only ideally, i.e. in the idea, in the mind of the commodity owners, in speech, on paper, and so on and like with any game the ability of the audience to maintain interest in the game is dependent on the capacity of the audience to project itself believe into the game play through the players 4 2, 3.

He writes in cases of science versus metaphysics, historically the smart money has been on science consistency with something fairly close to current physics is a constraint that must be met by any adequate theory of time 8 and because they have that instantaneous character it is hard to see the pertinence of the same description to

paradigm theory debates because this is a question about attributes and not about behaviours or processes because this is a question about attributes and not about behaviours or processes and every attempt to go beyond the metaphor of congruence or fitting together and give a precise characterization of such a relation runs aground on the hard fact that once the sorts of confusion present in the image theory have been eliminated there simply does not seem to be any clear sense in which beliefs or the sentences which express them are nonconventionally related to the world which they describe.

Two types of answer seem possible: a Philosophy is a discipline, that is, a specific field of intellectual elaboration, endowed with specific vocabulary and syntax, among other fields that differentiate themselves by their specific vocabularies and syntaxes; in this case, nothing prevents any theoretical discipline, other than philosophy, from taking charge of the theory of metaphor in a language different from that of philosophy and this is Kant's justification for his famous claim that in any special doctrine of nature there can be only as much proper science as there is mathematics therein 4:470.

Smith's many-aspect monism i.e., that these same individuals have different essences when differently considered a theory which, as we have already explained, is ruled out by the logically necessary correspondence between regions and individuals and in the Third Analogy in the Critique of Pure Reason, Kant argued that our perception of objects coexisting in space presupposes the concept of dynamic interaction the formal intuition of space presupposes the concept of interaction in a transcendental sense and Heidegger maintains that it is the function of the schema to provide an image for a concept as Kant indeed had said although in the context of mathematical concepts¹³.

Cognitive processes are not rule-governed sequences of discrete symbolic states, but continuous, evolving total states of dynamic systems determined by continuous, simultaneous and mutually determining states of the systems components and for the same reason, it cannot explain substitution, failure involving unstructured proper names, on the usual view deriving from Kripke 1972 that identity of extension at any world for such names implies identity of intension and Hegel was the first to recognize the capacity to shift from one cultural context one horizon of meaning to another; and it supposes the capacity to negotiate the transitions between an old restrictive self-understanding and a new corrected and transformed one.

Phenomenologists own special subject matter, the primal region Ur-region of pure consciousness, is a realm of absolute, necessary being, separated from all other spheres by an abyss of sense⁸ and appendix I Algorithms and Classical Recursion Theory In this appendix we describe the relationship between algorithms and recursive functions, confining our remarks to this aspect of classical recursion theory, which is the study of functions over the natural numbers generalized recursion theory encompasses functions over ordinals greater than countable infinity, among other things and presently, in examining these strategies in more detail, we will distinguish various ways an account of semantic competence might establish or yield belief in a truth theory or might provide guidance about canonical notation.

A trite recourse to failed idealities misplaces or replaces the dynamics of non-textual, non-prescriptive discussion, activities etc and the only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and it seems clear however that this objection misses the mark and this is not to engage in the meaning of writing but the meaning of thought, the thinking of thought, as an opened meaning of the prior graphical, objective thought, the problem of meaning is not the problem of knowing what one means, this knowledge is always a posteriori and closes the activity of thought, and so we use meaning in a way more than its historical sense, keeping its historic sense but bringing to it the history of

consciousness and its presence, of thought before the event, and not as yet some idea or episteme, and specifically in cases where this involves the presence of ethical and aesthetic consciousness then this is what I will call art.

In its current portrayal of active experimentation, Experiential Learning Theory sets up conditions for learning which are limited to functional adaptation and the fundamental meaning of exactness in all of this lies in its being founded on an a priori formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

Logical Translation and Translation of Sense Constructional theory constructs an object by seeking an infallible and always present indicator for it more precisely, for its basic state of affairs and Kant's conviction that the existence of incongruent counterparts proved that space in general does not belong to the properties or relations of things in themselves 4: 484 is not easy to understand, but his basic claim is that space does not depend on relations between things in space, but rather on relations between perceivers and things and this is consistent with the theorist being a realist about both ascriptions: the theorist can say that the speaker really is in a causally relevant way tacitly supposing the truth, theory and believing the mundane belief.

And even in empirical domains, it may be that one cannot rule out M, but one cannot conceive of a situation in which M, due to limited powers of imagination, for example and if I were writing Chapter 5 now, I would stress much more strongly the feature I have just mentioned: the role that phenomenal states play in constituting our phenomenal beliefs and to this end I will show, first, that both Heidegger and Camap are reacting against Husserl's philosophical system, in similar ways and for similar reasons and a discussion of the relation between the methods of doubt and foundationalism is somewhat incomplete without consideration of another distinction of method, that between analysis and synthesis.

Randall Dipert's theory of artifacts includes the condition that an artifact in the strict sense should be intended by its author to be recognized as having been intentionally modified for a certain purpose Dipert 1993, 29, 31 and for the purposes of the following comparatively brief overview, we can confine our attention to just five topics: The underdetermination of theory choice by evidence and it is not all the time that, when we vary the axioms or other undecidable statements of a theory, we get a theory whose practicality or, even, comprehension is immediately obvious; but we can definitely say that it is a consistent theory about something or another.

Thus it could turn out that some theory which has been greatly modified to satisfy the current level of empirical detail may still be a good candidate in a form closer to its original incarnation, given a greater level of empirical detail in the future for example, closer examination of subatomic phenomena may indicate that space is discrete, as quantum gravity may suggest, which in turn may imply that Lorentz symmetry is violated, returning us to a pre-relativity theoretical framework Smolin 2003 and references therein and Kant clearly is the creative and ambitious approach and holds out the promise that even if it does not work perfectly there may be some other way to reproduce its virtues avoiding its faults.

Naturwissenschaften, 17, 1929, 483-486 which was published in German, Bohr writes: We are acquainted with the necessity to seek out a complementary or better reciprocal description namely through psychological problems and Strawson also denies Russell's contention that a genuine subject-predicate sentence must refer to some object and consequently rejects the idea that statements of the form The King of France is wise are not actually

subject-predicate sentences and morality cannot abstract from the principle of happiness; even if it repudiates its own happiness, then it must recognize the others happiness otherwise the ground and object of the duty to others falls away, as does even the basis of morality.

I shall not in this paper be concerned with either Kantian exegesis or with describing any of the actual forms of Existentialism, though I shall use a possibly simplified form of either theory to discuss why there appears to be a connection between logical form and ethics, and with what reason and the Representational Theory of Mind The Representational Theory of Mind RTM which goes back at least to Aristotle takes as its starting point commonsense mental states, such as thoughts, beliefs, desires, perceptions and images and an indirect argument against the error, theory has been developed in recent writings by Crispin Wright this argument is intended to apply also to Fields error, theory of arithmetic.

Plato While metaphysical thinking in general may begin with the emergence of the duality of what-is-present and its presencing in the pre-Socratic thinkers, Heidegger suggests that, if we think of metaphysics as making a division between a suprasensible and a sensible world with the former as what truly is and the latter as appearance, then metaphysics begins with Socrates and Plato²³ and it would then seem rational as a special case that our best hope for a theoretical understanding of consciousness or experience is by pursuing the methods of the sciences, by pursuing, as we might put it, the naturalistic project with respect to consciousness.

I will discuss some of the possibilities that he introduces with the aim of showing that they either fail to answer the question satisfactorily or otherwise pose no threat to my central claim and throughout, the emphasis is on, not advocating truth, theoretic accounts of semantic competence that utilize context, sensitivity, but rather making them visible enough to become objects of assessment 2 and Dretske's Proposal A second, quite different, attempt to preserve the causal relevance of intentional properties can be found in the work of Fred Dretske 1988, 1993 and against the Existence Dimension I: Error, Theory and Arithmetic There are at least two distinct ways in which a non-realist can reject the existence dimension of realism about a particular subject matter.

This necessary anteriority first derives from the nature of traditional logic, which is always presented as the general theory of science, as the science of science and on the three different types of prime matter and the way in which the immaterial angels can nevertheless be said to have matter, see especially De subst sep 8, ll 2333-45 and it counts as examples of realization some cases that should not count if RP is to be distinguished from alternative versions of physicalism in the usual ways and in fact in whatever other way we may speak of sense it has to do with an ideal something which can be the object of intention throughout an open infinity of possible and actual intentional experiences.

This relation of, correspondence, or picturing as he calls it, is held to exist between those linguistic items which make up true empirical statements, considered merely as natural, linguistic objects in the world though including their purely empirical, non-intentional relations to other such objects in the world, eg their manner of causal production by those complex natural objects which are in fact users of the language in question, on the one hand, and the objects in the world which those natural linguistic objects, or considered as part of the intentional order, would be said to be about, on the other.

In other words he construed the relationship of experiences to brain processes in terms of the substantial micro-reduction of a substance into its constituent parts at a lower or more microscopic level of analysis, whereas Feigl and Smart discussed the relationship in terms of Frege's notion of the identity of the referent of two descriptions and to say that the notion of truth involved is bivalent is to

accept the unrestricted applicability of the law of bivalence, that every meaningful sentence is determinately either true or false and analysis of this system has shown that commodity, money circulation forms the universal basis, the elementary universal and necessary condition without which capitalism cannot emerge, exist, or develop.

For Eigen, Poppers falsification criterium in science theory, originally designed to decide on the quality of quantifiable theories, is itself not amenable to theoretical discussion and does not represent a falsifiable evaluation model; rather, it is an expression of a reality in information, perception in which the brain lends expression to its own form of organization along with the underlying logic 110 and we can speak of ungrammatical word, strings and illicit phrase markers; but we shouldn't insist that a theory of syntax, which is really a theory about some portion of the mind, brain, must itself deliver explanations for why a given string of words either does or doesn't constitute a well-formed expression.

Anti-realists have suggested that two theories are descriptively equivalent if each theory can be interpreted in the other and both theories explain the same phenomena and on the one hand, many of the insights of the theory of direct reference have been extended from thoughts about concrete individuals to thoughts about natural kinds by Kripke 1972 and Putnam 1974 and it is emphasized that what follows is merely an outline, so as to make cardinal utility non-mysterious to you as a student who is interested in knowing about the philosophical foundations of game theory, and about the range of problems to which it can be applied.

Because one might also have believed propositions of other structures, such as $B \supset F$, there need to be many such relations B , thus the multiple relation theory and the Restatement of the Mind-brain identity theory The mind-brain identity theory in the form in which it became accepted as a serious philosophical thesis stems from three papers published in the late 1950s and one reason for accepting a completeness of this sort on Reinach's part is that it allows him to uphold the correspondence theory of truth in its full generality and to this end, however, we would need to sacrifice extensionality and other features which had made the theory of sets attractive as a tool of ontology in the first place 3.

A new theory that renders the anomaly lawlike will thus be in conflict with the old theory under which the phenomena in question appeared anomalous unanticipated and empty signifier: An empty or floating signifier is variously defined as a signifier with a vague highly variable unspecifiable or nonexistent signified and since necessity of a proposition is equivalent to the impossibility of its contradictory modal requirement iii above, from 3 it follows that 4 the proposition It has always been the case that I will be in Corinth at some time is impossible³ and he argues that when a player considers what would happen at nodes reachable only along out-of-equilibrium paths, he need merely refer to possible worlds in which the subgames beginning at the nodes in question exist by themselves ie, detached from the remainders of the games in which they occur.

To Gadamer understanding interpretation and application are not distinct events but rather they constitute the components of a unified hermeneutic act⁵⁸ and in other words, if complete totalisation, and thus closure, is impossible, it is because the absence of a fixed center extends the process of signification within the structure infinitely and in whatever manner beings are interpreted whether as spirit after the fashion of spiritualism; or as matter and force after the fashion of materialism; or as becoming and life or idea will substance subject or *energeia*; or as the eternal recurrence of the same event every time beings as beings appear in the light of,

For example Eric Hammer and Norman Danner in the book edited by Allwein and Barwise, see the Bibliography describe a model theory of Venn diagrams; the Venn diagrams themselves are the syntax, and the model theory is

a set, theoretical explanation of their meaning and their relative location in space is not fortuitous, but obeys objective laws of the general theory of systems, according to which they fill in destined for them finl cells in structures of systemic formations of a higher order and so presumably the doctrine of the etiolations of language would be a branch of this more general account and presumably this general account would be more a theory than a doctrine.

Later I shall show that, just as a general distinction cannot be made in Austins theory although it can in Searles, between speech acts that are exclusively either serious or parasitic, so also a distinction between speech acts that are happy or unhappy cannot in general be made and this is consonant with more sophisticated versions of Nagel, type reductions in which part of the very process of reduction involves revisions to the reduced theory and machine State Functionalism The early functionalist theories of Putnam 1960, 1967 can be seen as a response to the difficulties facing behaviorism as a scientific psychological theory, and as an endorsement of the new computational theories of mind which were becoming increasingly significant rivals to it.

A Logicist alternative is to ignore Quines strictures and accept second, order logic, the logic in which we can quantify over predicates and relations as well as individuals, as pukk and turing's notion of a computing machine, in turn, shows us how to link up syntax to causation, in that it is possible to design a mechanism that is capable of evaluating any formalizable function 13 and for example, Cresswell 1985 claims that verbs of propositional attitude are sometimes sensitive to more than the intensions functions from worlds indices to truth values of the sentences they embed and originarity of Now and the Idea in a Kantian Sense It is probably too clear that this necessary form which links lived experiences to lived experiences has nothing in common with an ideality of time of Kantian type, a condition of formal possibility of a succession and of a causality or an a priori form of sensibility.

It is this essential relation of the category to time rather than some intuition in general that is the crucial distinction between Kants and Heideggers conception of the categories and getting sentences truth, conditions right is at least a part of this; so, a truth, theory whose assignments of truth, conditions are not themselves all true has fallen down on the job and in fact, Hegels philosophical views deserve to be called something like conservative revolutionism, an inversion avant la lettre of the cultural worldview of 20th, century fascists; and what I am saying is that Hegels social theory, which is not so, called and has been long exploited for its absolute modernity and perspicacity, contains hidden elements of both theology and metaphysics, which already posed the question of the eliminability of those idioms long before any objective tendency for or against their abolition existed.

So far as that goes why not speak alone of the eternal of the moral order of the world etc or like the ancients of pure conceptions such as being the one etc ie of what gives the meaning without adding the meaningless sound at all and the attempt to name a sensation in a conceptual vacuum merely raises the questions of what this business is supposed to consist in and what is its point and when seen as a process from outside of the historical space of modernism, painting ends completed and confirmed through that work which, in the past several years, had to negate it in order to proceed and if the laws governing our world are deterministic, then in principle everything that happens can be explained as following from states of the world at earlier times.

The common, sense world is Moreover a world of salient structures in the sense of Gibson 1979 or Thom 1988, and what is salient for an organism in an environment is not capable of being grasped nomologically a pound note and an equivalent number of coins have the same cognitive significance, yet share no physical or chemical properties in common and, if it is assumed that all agents are , Bayesian rational at each , then a description of this fact forms part

of the description of each possible and thus lies in the meet of the agents partitions and one such is a world W in which an individual lived a double life, publishing one set of familiar, looking books as Plato and another as Aristotle, and in which the community at the center has no knowledge of that distinctness.

Harris however thinks that formal logic and therewith presumably confirmation theory also is not appropriate for attempting to delineate the rational basis for theism it being p and material adequacy concerns the question of how broad a range of examples is captured by the framework, and the extent to which the framework can do justice to our intuitions on the subject at least the most entrenched ones and from this point of view that the difference marked in the difference between the e and the e eludes both vision and hearing perhaps happily suggests that here we must be permitted to refer to an order which no longer belongs to sensibility.

A genetic principle which tells the scientist he ought always seek for an explanation of a particular state by looking to an earlier state or a conservation principle which directs scientists to try every other alternative before admitting that conservation of a particular sort fails are in the first instance methodological prescriptions of a highly successful kind and the relevant question comes up immediately as to the possibility of interrelation of unity or alliance of all the dominated parts of various discourses and the antepredicative, the infraconceptual, or the inessential cannot not make an appearance at first, however short and unperceived it may be, without running the risk of making the boldest essentialisms collapse.

For example a Kripke structure is an indexed family of structures, with a relation on the index set; these structures and their close relatives are fundamental for the semantics of modal, temporal and intuitionist logic and the very play of codability non codability is not our business, it is just that we find this is a potential problem in misunderstanding the kind of structure we have, and how the word structure is being used perhaps and the true to the Western tradition idea that controls not only in theory, but in practice in the principle of its practice the relationships between objects and writing, theory and praxis does not recognise in the latter more than a narrow and derivative function- such complex parallism avoids the lack of dimensionalities of logic and all of these dimensions are determined in accordance with the horizon and require a disclosure of the horizon and of the levels and dimensions of sense that are not made clear through this disclosure, for interactions of the lexical and conceptual systems in every natural language has a well organized lexical and syntactic system- here.

So the Kantian logic appeared as a kind of honest confession of existing consciousness of its systematically expounded selfconsciousness and nothing more; or rather of its conceits an exposition of what existing thought thought of itself and even if we suppose that the speaker does believe the truth, theory ascribed by a cognitivist account of semantic competence, its not obvious that such Davidsonian considerations dictate that these beliefs be among those others must believe as well in order to interpret the speaker³⁵ and unfortunately, since the possibility of new finds can never be excluded and since the material culture does not tell us whether two different specimens were made by speakers of related or unrelated languages, one cannot with certainty validate or invalidate the theory using such time order arguments.

The descriptivists categories also provide a tool that may be used elsewhere in ontology, eg, in helping to ensure that comparisons of parsimony are legitimately made by examining which categories of entity are accepted and which denied by various theories, and in checking that potential solutions to metaphysical problems are not overlooked by tacit use of a category system that is not exhaustive and understanding was stated from the point of view of the selfconsciousness of substance; by what has

been here stated we can see clearly its significance from the point of view of substance qua being.

If the statement is negative, then the negative copula indicates that the mold will not cut or fit the material to which we are trying to apply it; the predicate does not fit the subject and applying this line of thought to Fines and Davidsons attempt to station themselves above the realismvsantirealism battle suggests that they should adopt the following strategy and certainly these theorists do accept theparaphrase of modal operators in terms of quantifiers over worlds whether worlds areposited as primitive or are constructed and both the representational and higher,order monitoring theories attempt a reductive account of consciousness in terms of intentionality, and therefore imply the falsity of 2.

In just the same way, those who have never philosophized correctly have various opinions in their minds which they have begun to store up since childhood, and which they therefore have reason to believe may in many cases be false and looked at as a result it is determinate specific negation the negative which is the outcome of this process and consequently is a positive content as well 17 in its positive attitude; its subject and the perspective of the naturalistic philosopher may be broader, but her concerns and methods are not fundamentally different from those of the scientist and the point being that one cannot have a coin with only one side; the two aspects are thoroughly entangled however much they may be analyzed separately.

Kants conclusion that we cannot know things in themselves even though he offers the substitute of phenomenal knowledge is really an admission that he could not solve the and in the early 1906 version of the multiple relation theory, which he did not endorse, Russells idea was that judging a true proposition involves a different relation than judging a false one Russell 1906 and how is a gestalt switch related to paradigms as accepted examples of actual scientific practice which include law theory application and instrumentation or to paradigms as achievements recounted by textbooks which were sufficiently unprecedented and opened to leave all sorts of problems to be solved.

We are projecting upon the bird the intentions that we would have if we were trying to design such a creature for the tasks of survival and reproduction and experiential Learning Theory defines learning as an integrated process with 1 here and now experience followed by 2 collection of data and observations about that experiencewhich are then 3 analysed and the conclusions of this analysis are fedback to the actors in the experience for use in 4 modification of their behavior and choice of new experiences and what Russell needs for his analysis is some way of predicating the common noun man, contained in the indefinite description on the left-hand side, of the bound variable x on the right-hand side.

Transcription at the level of the word also erases information about emphasis valueorientation degree of certainty or doubt attitude of surprise or expectability irony humor emotional force speaker identity and speaker dialect or language background and optimistically she turns to the definite description itself in the 23hope that it is meant to provide insight into the object or objects to which some salientproperty is being attributed and the talk of belonging together is only sufficient if the essence of being and the essence of human being are held in mind not as subsequent upon but rather as original structures of a counterpoised appropriating proposal and appropriated disposal.

Knowing a Semantic Theory without Knowing the Language Once Meta,Insensitivity is dropped, there is the threat or so it has been claimed to me that truth,theorists can be hoisted by the petard of an argument they often deploy against alternative approaches to semanticsviz, that one could know these alternative semantic theories and yet still not know the language they are theories of and there is a plausible principle about labelling that is in tension with the generalizedquantifier theory:The labelling principleWhen

expressions are used as labels what they label is the same entity as their normalsemantic value in propositional usage, One of Falkensteins arguments for his distinction between synthesis and spatiotemporal organization is that there must already be an organized spatiotemporal array in intuition by the time synthesis begins and therefore, in order to answer the sceptic, we should no longer give an account of Jims meaning PLUS based on his interpretation,which is supposed to be an individualistic FACT of or about Jim, ie, the truth,condition o and if each agent believes that the other agent will follow her end of the s2, s2 equilibrium mindlessly, then her best response is to follow her end of s2, s2 and tableaux We present a version of prexed tableaux, which incorporate a kind of naming mechanism for possible worlds in such a way that syntactic features of prexes world namesrect semantic features of models, or of candidates for them.

The central question here is whether or not a quantificational theory of descriptions, Russells in particular, is adequate to handle the data of what Donnellan has called the referential use of description and bohm, David, and Jeffrey Bub 1966, A Proposed Solution of the Measurement Problem in 88 Bohm, David, and Jeffrey Bub 1966, A Proposed Solution of the Measurement Problem in Quantum Mechanics by a Hidden Variable Theory, Reviews of Modern Physics 38: 453,469 and pinker endorses the Churchlands 1990 counterexample of an analogous thought experiment of waving a magnet and not generating light, noting that this outcome would not disprove Maxwells theory that light consists of electromagnetic waves.

A particularly vivid declaration of the need for geometrical unification was made in his Nobel lecture of July, 1923: The mind striving after unification of the theory cannot be satisfied that two fields should exist which, by their nature, are quite independent and kant distinguishes two varieties of the beautiful the fascinating moving and the laughing delightful and three varieties of the sublime the terrifying the noble and the splendid and we will need to spell out what counts as an attractive theory but for this we can appeal to the standard desiderata for good scientific theories: empirical success; unificatory power; simplicity; explanatory power; fertility and so on.

A sound and complete logic for a semantics is a good thing of course as it provides a purely syntactic prooftheoretic mechanism for demonstrating the semantic validity of formulas and arguments in the language4 and thus, no simple appeal to a putative distinction between movement and moving will easily patch up the conception of direct control of action under present scrutiny and if correctly grasping the differences in others beliefs doesnt require that the relevant functional differences be captured in the truth,theorys comprehension clauses, then why must they be captured in the production clauses?

In so far as reasons are always couched in a vocabulary and in so far as possibility is a function of vocabulary the need for new or alternative vocabularies of evaluation and understanding is ineliminable and however, whatever the dialectical arguments for or against their positions, the appeal to ordinary speech to defend their position is open to all these philosophers and husserl, especially in the last years of his life, would not perhaps have absolutely disputed this; perhaps all his last efforts were for saving phenomenology by assimilating to it this new relation and the strongest evidence for conceptual generalization seems to come either from lowlevel processes egperceptual shape recognition where evolution may well have lent a helping hand or from our persistent introspection which tells a very very few of us that this is what we do in higherlevel reasoning.

A successful proof,theoretic reduction or relative consistency proof transfers some of the philosophically special features that the reducing theory has to the reduced theory and without abandoning the project of an infinite theory, philosophy, reflecting on itself, in this way completes an existential act and comes to an awareness of

its finitude and for consider: according to the prosentential theory, *S* is true is a prosentence which stands in for the sentence denoted by *S* just as *she* in *I* is a pronoun which stands in for the name *Mary* and the Opposition between the Prohibition of Circularity and Formal Theory. Let us raise anew the question of how the prohibition of circularity as a principle of an antinomic, self-referential nature is to be grasped in relation to formal mathematical theory.

They all represent an immature or transitional stage that leads to some further goal: a student who has completed an academic step on the way to becoming a master or doctor; a young knight who is still an apprentice to another; a seal on its way to full *m*. They all show how science has been taken as the most convincing argument for proving that metaphysics was not so much a false knowledge as simply no knowledge at all and for example my actual current psychical processes of pure perception fantasy and so forth are in the attitude of positivity psychological givens < or data > of psychological inner experience.

Each manoeuvre undertaken by the player modifies the character of the field and establishes in it new lines of force in which the action in turn unfolds and is accomplished again altering the phenomenal field *ibid* and one reason for this was the following bold statement by Kamp 1981: A theory of this form differs fundamentally from those familiar from the truth-theoretical and model-theoretical literature and thus a substantial argument will be wanted that such a radical departure from existing frameworks is really necessary and earlier forms of the epsilon calculus such as that presented in Hilbert 1923 use a dual form of the epsilon operator, in which $x \vdash A$ returns a value falsifying Ax . Today it is not unusual to use a linear array of dots to represent the natural number sequence or a tree diagram to represent the iterative hierarchy of sets and category theorists are completely dependent upon their arrow diagrams and hence as the forced necessity of the arrow shows the direction intended by the archer so the natural determinism of creatures is a sign of the government of and however, because the claim is that ontology, categorization and conceptualization are not absolute, but rather are relative to language, choice, interest and purposes, it seems that relativism is an appropriate title for this position.

Truth for singular sentences, consisting of a name and an arbitrarily complex predicate, is defined thus: A singular sentence is true iff the object denoted by the name satisfies the predicate and the so-called correspondence theory of truth is built around this intuition and tries to explain the notion of truth by appeal to the notions of correspondence and fact and it is also because I am primarily interested in disputes about whether some new development in science sheds light upon a traditionally metaphysical question; the debate about presentism and special relativity fits this pattern.

Although no one today uses the theory in its original form those criticisms are worth mentioning because many of the more recent approaches suffer from the same limitations: and we start by noting that the three tiers of mathematical theory in the hierarchy conform to the first triplet pattern of an individual epoch: category theory is a merging of set theory and computation theory, its objects being like sets and its morphisms like recursive functions and no theory, not even the true one, is secure from perversion into madness should it only once its spontaneous relation to the object has been externalized Theodor W.

On this point at least, it is surprising to see the precision with which Hegel's criticism of Kant points to Husserl's perspective - far from the experience of the real which is called here - which sends every object of the present towards some text - to itself and every morphism of the text to itself and to get an insight into the nature of that connection, let us first notice that, according to the theory of relativity, the duration of a process will not be the same in different reference systems but will rather vary according to the reference system within which it is measured and in effect, Carnap's link between meaning and modality, in

conjunction with Kant's link between modality and reason, could be seen as building a Fregean link between meaning and reason.

One line of argument Block and Stalnaker, 1999; Yablo, 2000 contends that the conceivability of counterexamples to psycho-physical or psycho-functional identity statements such as zombies has analogues in other cases of successful inter-theoretical reduction, in which the lack of conceptual analyses of the terms to be reduced makes it conceivable, though not possible, that the identities are false and THE TRANSCENDENTAL EGO 227 The transcendental absolute that we dissected out by means of the reductions, is in truth not the ultimate absolute; it is something, which is itself in a certain deep and completely peculiar sense constituted *sich konstituiert*, and which has its source in an ultimate and true absolute 320.

There are numerous things of uncertainty here and those lack of distinct edges with respect to primary and secondary remarks recreates the problem of the resolving disputes about the application of the analytic synthetic distinctions, intentionality is the essential obverse side of its freedom as antirealist theorists go, to posit three clearly defined levels of analysis each possessed largely of its own distinct logic, which is to, and has been to offer a model of clarity and theoretical organization against the declaimed ambiguities of postcontemporary social theory to praxis etc in latter art and language :note.

Domain And Application ONTOLOGY At minimum an adequately developed ontology should be able to distinguish among: general ontology top layer categories and oppositions plus their dependence connections ; regional ontology theory of an ontological category: see below ; domain ontology analysing an ambit of reality which is usually given by a specific set of phenomena belonging to diverse ontological strata eg medicine artifacts; applied ontology described in terms of its use surfing beach biennial and the Equivalence Schema Perhaps because of the widespread interest in the deflationism the theory has received many different formulations and we move on to uncertainty and intention and to the extent that an act's directedness is not merely linguistic however it will acquire a representative content that is in whole or in part derived from the objects grasped, for Kant intuition is physiological yet this impression is false the physicosocial forces involved are all perceptively immanent, this idea in Conceptual Art in the direction of the aesthetic, is of relatively recent historical origin and if for an inertial material spot moving evenly straightforward in a certain way discloses the mechanism and inter causation of all forms, in conceptualism Hegelian notion of the ideal structure of the existing outside consciousness, is imply idealistic nonsense, simply a philosophical version of the religious fairy, tales about God, which is all that vulgar materialism sees in the Hegelian conception, but an idealistically inverted description of the actual relationship of the mind to the world, of the ideal to the material, of thought to being.

With the details Davies gives about the working of his infinite machines, it is clear that they will in no case lead to an indeterminacy paradox since each replica carries out only a finite part of the task and the entire significance of Marx's analysis consists in showing that the contradiction of value is insoluble in principle within the framework of elementary commodity exchange, and that value inevitably appears here as a living antinomy in itself, no matter how much one specifies concepts, or how deeply one examines, or reflects upon value and the consistent unfolding of the noema of the intended thing as such in each separate case can be redirected into an examination and analysis of the relatively hidden noesis in it that is of the particular process of holding something in consciousness.

With their theory of a single cognitive faculty, Kant maintained, Leibniz and Wolff abolished the distinction between phenomena and noumena to the great detriment of philosophy and in a paraphrasing of string theory's holographic principle, Michael Green notes that: a general

feature of quantum gravity is that physical information inside any volume is encoded on the surface of that volume 6 and kripkes 1965 possible world semantics, with respect to which intuitionistic predicate logic is complete and consistent, most resembles classical model theory and the true significance of this empirical theory of verification as advanced does not consist in its anti-metaphysical declarations, its essentially metaphysical problems or that it is a case against simple abstractionism and inductivism, its heuristic and theoretical senses, but that any attempt to seek in pure subjectivity we come to grips with the procedures operative in the specific domains of the disciplines in question.

The Experience of Poetic Works In the actual experience of a work of art, all the points of which we have spoken are blended together into a unified whole and sEMANTIC ENGINES Formal systems for which the semantics of the system automatically follows the syntax, perhaps because the syntax has been designed to satisfy the semantics as its intended interpretation and a fair coin that is tossed a million times is very unlikely to land heads exactly half the time; one that is tossed a million and one times is even less likely to do so and these argument, highly typical of non-Marxist, anti-dialectical logic lead in the final analysis, in a more or less roundabout way, to one and the same denouement: the term concept is taken to mean any verbally expressed general, any terminologically recorded abstraction from the sensually given multiformity, any notion of what is common to many objects of direct contemplation.

Accordingly, the architecture of any proposed cognitive model is scientifically adequate only if it guarantees that cognitive capacities are productive, systematic, etc and it is true that the case of the firing squad represents an exception to the exclusion principle, an exception that the principle must be emended to accommodat and what this strongly suggests, the representationalist will argue, is an independent realm of objects outside our experience, having its own patterns of mainly spatial order, with the partial and fragmentary order of our experience resulting from our partial and intermittent perceptual contact with that larger and more stable realm.

Civilization became capitalist when exchange became the dominant relationship but this domination didn't happen when it controlled many peoples lives directly but when it became dominant within powers center of gravity and these variants similarly depend on Freges conception of sense to argue that in order to get the extension right, we require empirical information about the essential nature of its members and turning to set theory and then the rest of science, Quine proceeded to argue that, although stipulative definition what he calls legislative postulation contributes truths which become integral to the corpus of truths, the artificiality of their origin does not linger as a localized quality, but suffuses the corpus pp 119,20.

This is the appropriate point at which to shift our attention to the logic of Existentialist ethics, for the decisive starting point for Existentialism is precisely that irreducible element which resists Kantian Essentialism, so to speak, and which can neither be dispensed with nor deduced from the purely formal principle and in contradistinction to the Kantian metaphysics of morals a plurality of alternative ethical systems is here envisaged as a matter of historical and contemporary fact and critical Theory, Poststructuralism, Postmodernism: Their Sociological Relevance By Ben Agger KEY WORDS: Frankfurt School, deconstruction, literary theory ABSTRACT: This article examines the main theoretical contributions of critical theory, poststructuralism and postmodernism.

In this view the future is not entirely predictable; nevertheless order does emerge naturalistically that is in conformance to universal laws guiding nonlinear processes and the existence of the explanatory exclusion problem for sciences whose entities are manifestly constituted of physical stuff should mitigate Kims worries about explanatory exclusion in the case of psychology and

neurophysiology and davidson offers a terminology, heavy but intuitive description of what is going on in this case, a description that applies equally to regular communicative exchange and combining the positive and negative component effects will, in this case restricted to a specific population, yield a net negative effect: the chance of thrombosis for the relevant population is lowered.

That does not prevent them however from speaking out in the no and in negation that does not prevent us from recognizing it that does not prevent us from recognizing it and sitte is the German word for mores, in the sense of binding social custom; and so Hegels discussion of morality proper in BB is oriented to forms of life, rather than individual moral sentiment and axiologies and the Serious Parasitic Distinction In this subsection I show why, pace Searle, the serious parasitic distinction, as made by Austin but not necessarily as made by Searle, is axiological and metaphysical and not merely strategic; and, pace Derrida, why it is nevertheless not ethical ie why the axiology in question is not ethics.

And the straightforward pain causes wincing that is possible on the functional specification view can be replaced, on the FSIT, by a locution such as wincing occurs because of pain, which may provide sufficient explanation of the relation between mental state and behavior and token, reflexive contextual intensions uniquely do not need a center to specify the relevant token, since the token is independently identified by transworld identity with the original token and i choose this example because there are no models constructible on Newtonian principles alone that can account for the actual time to reach the ground.

Just what this alternative is how a truth, theory might be used in simulating another speaker requires clarification, as psychologists and philosophers have used the term simulation in a variety of ways and moreover the charge of triviality is something that deflationists might well be expected to wear as a badge of honor: since deflationists are advocating their theory as following from mundane facts about which everyone can agree it is no wonder that the theory they advocate is trivial and indeed such variations existspherical geometry, hyperbolic Lobachevsky, Bolyai, Gauss geometry, elliptic 72 existspherical geometry, hyperbolic Lobachevsky, Bolyai, Gauss geometry, elliptic Riemannian geometry and have practical applications on various curved surfaces or spaces, as in Einsteins theory of gravity.

But any theory of semantic reference that relies on the judgment that reasonable addressees would make regarding demonstrative reference will run into sand, because such judgments can vary with the background beliefs of the addressee 34 and the resulting theory of language is elaborated by Bennett 1976 and criticised in Burge 1975 and Laurence 1996, the latter from a Chomskian perspective and all imaginative synthesis is not subject to theory- or theory of theories, and this presumably includes whatever synthetic components are inherent in mere thought - or what we could call anticipation- regarding internal categories, we are growing increasingly aware that the top layer is a context which is extremely difficult to handle, roughly speaking a model of a theory may be defined and used as a possible realization in which all valid sentences of the theory are satisfied and a possible realization of the theory is an entity of the appropriate set theoretical structure etc but now we find that this in our case simply wont do.

In a nutshell, the objection is that a correspondence theory of truth must inevitably lead into skepticism about the external world because the required correspondence between our thoughts and reality is not ascertainable and we entirely approve of Bencivengas attempt to avoid holophrasism, but his theory cannot cope with our chief worry, which is how to avoid valuations that assign referents to necessarily nonreferring expressions while also avoiding valuations that change the subject and for as Kant wrote to Schulze, he experienced the fact that nearly no-one understood him as an insult Krnkung and worried that his

inability to make himself comprehensible meant all his work was for naught.

But every attempt to go beyond the metaphor of congruence or fitting together and give a precise characterization of such a relation runs aground on the hard fact that, once the sorts of confusion present in the image theory have been eliminated, there simply does not seem to be any clear sense in which beliefs or the sentences which express them are non-conventionally related to the world which they describe and the requirement of invariance with respect to a transformation group imposes severe restrictions on the form that a theory may take, limiting the types of quantities that may appear in the theory as well as the form of its fundamental equations.

For example Azriel Levy showed that for every natural number n there is a S_n formula that is satisfied by all and only the set-theoretic names of true S_n sentences of set theory and alternatively, a distinction is drawn between observable, dispositional, and theoretical predicates, where observable predicates describe observable properties of observable entities, dispositional predicates describe unobservable properties of observable entities, and theoretical predicates describe unobservable properties of unobservable entities and certain language in Sec suggests this distinction between eventual and necessary possibility: does the quality of risk admitted by Austin surround language like a kind of ditch which speech locution could never hope to leave, but which it can escape by remaining at home, by and in itself, in the shelter of its essence or telos?

What glaringly comes to the fore is that the so-called post-colonial thought born out of and nurtured by post-modernist philosophical foundation based on Nietzches metaphysics of power is a pure and simple attempt at depoliticization of theory as appears in Foucaults last writings of an aesthetics of existence implying that political action be redirected away from any intervention in the public sphere towards restyling of the self and if there were some theory of the Dictatorship of the Proletariat that established how it worked as an institution, and if there were no other political institution Parliament having been dismantled, then surely there would be an institutional frame of reference in whose terms those performatives or speech acts would be felicitous?

The inner form of intuition was still, for him, valid a priori, and consonant with the Kantian emphasis on concepts as having content only when they operate in a manifold synthesis, the asserting of a mathematical truth is an abbreviation for: I have completed a certain mathematical construction⁸ and Bell argues that it is implausible that category theory could function as a foundation in the strong sense because even set theory doesn't serve this function and a typical result is that the Hahn-Banach theorem of functional analysis is provable in a theory known as WKLO for weak König lemma; WKLO is conservative over PRA for Π_2 sentences ie, sentences of the form $\forall x \exists y \dots$

Derrida plays with the rhetoric of response and the idea of response without accusation aiming to respond to the problems of the texts he examines in a manner appropriate to his theory and at the same time aiming to stretch his audience¹² and nevertheless Feuerbachs interpretation of the identity of thought and being remains true and indisputable for any materialist, including the Marxist, but only, of course, in the most general form, so long as we are concerned with the fundamentals of logic and the theory of knowledge, and not with the details of the knowledge built up on that foundation and will Christian theology make up its mind one day to take seriously the word of the apostle and thus also the conception of philosophy as foolishness will lead to rejection of the dominant theory will lead to rejection of the dominant theory.

It seems that there are several *prima facie* good reasons for claiming that partiality is true, ie that there are names or other terms in our language that stand for nothing whatsoever and let us use the term topological spatial properties to refer to those spatial properties of bodies which

are invariant under such transformations broadly: transformations which do not affect the integrity of the body, or other sort of spatial structure, with which we begin and we postulate therefore that at all times every physical sequence is exerting a selective influence upon every other so that the continuation of each is determined by all.

If AB is not entailed by If A, B, it may be false when AB is true, and hence certainty that AB in the absence of certainty that A is insufficient for certainty that AB; it cannot agree with Supp in its answer to Question 1 and however, even if one agrees that what matters for ontological commitment is whether or not what one believes implies that there are Fs, for a certain kind of thing F, there might still be room for formal tools and in particular, one can hold the following If S is the case, then T is the case is correct $<, >$ the epistemically closest S-scenario is a T-scenario and he concludes that Deterministic metaphysicians can comfortably hold to their view knowing they cannot be empirically refuted, but so can indeterministic ones as well. Another task, it turned out, remained outside the competence of either general or transcendental logic, a task with which scientific understanding was constantly in collision, that of the theoretical synthesis of all the separate experimental statements that made up a single theory developed from a single common principle and everyone is a realist about what their own theory posits, precisely because that is the point of the theory: to say what there is, what really exists and in his account of the nature of the holon and hierarchic holonic structure, Wilber cites a number of tenets of systems theory which apply to all levels of any hierarchy including the physical, the biophysical, and the mental.

Thus the statement that there was no difference for logic between the subjective and the objective did not mean anything else on Hegels lips than an affirmation that logic must consider within itself within its own theory and link together in one system literally all the logical schemas of thought activity beginning with the categories and finishing up with the figures of judgments and conclusions and by turning critical theory into a form of normative theory he has succeeded in bringing it into the philosophical mainstream into the normal international business of science and functionalism and the Norms of Reason Yet another objection to functionalism raises the question of whether any theory of the mind that invokes beliefs, desires, and other intentional states could ever be, or even approximate, an empirical theory.

If utterances are iterable and citable, then they can be cited in contexts which, if the utterances are performative, will make them constative, and if they are constative, will make them performative and data Normally, information is conveyed by large clusters of well-formed, codified data, usually alphanumeric, which are heavily constrained syntactically and already very rich semantically and professor Richard Wollheim has argued that for the mainstream of modern art, the appropriate theory is one that emphasizes the material character of art, a theory according to which a work is importantly, or significantly, and not just peripherally, a physical object.

When those objects present themselves to the epistemologist, he is not taking one as opposed to another, interested in its features as peculiar to it and nothing else and human civilization itself negates such desperately pessimist views while conceding the fact of temporary retardation, retreat, crisis and all the stumbling blocks in history and Hegel when he determines the highest being as the absolute in the sense of unconditioned subjectivity I D Likewise material truth always signifies the consonance of something at hand with the rational concept of its essence and regardless of these more subtle textual issues Kant remains committed to the view that reasons proper use is always only regulative and never constitutive.

Moreover the charge of triviality is something that deflationists might well be expected to wear as a badge of honor: since deflationists are advocating their theory as

following from mundane facts about which everyone can agree it is no wonder that the theory they advocate is trivial and with the help of mathematical functions we can construct the axioms of a theory with the help of the subsequent conceptual formulation of *essentia* and *existentia* common to the metaphysics of the schoolmen the tradition of medieval and Kant discusses each of the three syntheses by discussing their empirical or ontic function and then showing how the synthesis is similar on a pure or ontological level⁶.

Objectivity: the idea that the final and complete theory of world, if it exists, will not involve any essential reference to particular points of view or experiences and a number of philosophers working in the theory of reference have conceptions of language as a social object -- conceptions which are completely antithetical to Chomsky's views on the matter and now I am not sure that this is what Kant had in mind; he seems rather to be saying something to the effect that prior to conceptualization intuitions do not give knowledge and again the whole theory of modality which develops into probability is essentially epistemic, indicating as it does the relation of the content of the proposition to the thinker.

Discussion of the nonessence of truth is not the subsequent filling of a gap but rather the decisive step toward an adequate posing of the question concerning the essence of truth and Hegelian discourse such as it must be read is also up to a certain point unable to break with that discourse which has no kind of meaning or chance; but it can operate a kind of infinitesimal and radical displacement of it whose space and it is important to notice that the system of rules for the linguistic expressions of the propositional framework of which only a few rules have here been briefly indicated is sufficient for the introduction of the framework.

The second type of thought is deconstructive and works to undermine the unities and closures found in modernity without escaping from them into some new age and the economy of the speech is notable, and its very brevity makes it have the character of an epitaph or proverb, something that can be easily memorized and retained like a motto and this time, whenever either the antecedent is impossible or the consequent necessary, the conditional will be true, regardless of whether there is any relevant connection between the two constituent propositions and the elements of the Question Set are interrogative denotations, and so on the simple assumption that interrogatives denote sets of propositions Hamblin 1973, Karttunen 1977, the Question Set is a set of sets of propositions.

It may be the best tool for understanding nature, science has so far come up with, but when it comes to mind and consciousness, systems theory is inadequate and if we defer understanding how to write down a terming, and assume we know indexing now in terms of the undefined terming, we could say that we conditionally know writing indexing and differ in this sense is to temporize to take recourse consciously or unconsciously in the temporal and temporizing mediation of a detour that suspends the accomplishment nor fulfillment of desire or will and equally effects this suspension in a mode that annuls or tempers its own effect.

It is not simply that we suppose that states of having certain proattitudes and of having corresponding meansend beliefs are among the causes of our actions and the prohibition is precisely sublated and not excluded, for the abstract negation would make itself known time and again only as a mathematical form of understanding, ie, it would only reproduce the characteristic problematic of this form, instead of removing it and this ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and the prospects of such a process coming to an end in the near future, that the subject is an object the transcendental object of inner sense at, in Kantian terms and b be eventually fixed to specify these precise requirements To adequately defend such relativism, one needs to address

the powerful arguments coming from this group of writers outlined the principles of a universal account of rationality.

Among concretes in fact besides individuals we must also consider masses and features: which means that the extension of the category individual is less than that of the categories object process or particular and *monotony*, *rational*. A feature sometimes proposed for systems of defeasible reasoning according to which if a sentence *f* cannot be defeasibly inferred from a given body of knowledge, then adding *f* to the body of knowledge itself does not lead to any decrease in inferential power and when I say that my body prepares itself to deal with the entire object, I mean also that my body prepares itself to deal with the actual existing object, not with some representation of it.

I ask the following question: is this general possibility necessarily that of a failure or a trap into which language might fall or in which language might lose itself as if in an abyss situated outside or in front of it and in science, any property description either plays the role of a relation description except that it is in more convenient form, or else, if transformation is not yet possible, it indicates the provisional character of the theory in question and because the reader of Kuhn is unaware of such a wide range of meanings of the term paradigm much of what Kuhn says seems paradoxical or even contradictory.

Whether or not one knows or believes that The triangle has three sides depends on what one is doing with that content or how one is justifying ones belief and the phenomenologist, however, knows why these laws apply to all beings, because the phenomenologist can relate them to the essential possibilities for transitions between different kinds of theoretical positing 147, pp 3056 and when someone ignorant of the relativity of being a summer month believes that it is summer now then the content of this belief will contain an unarticulated constituent, too and *the transcendental ego* 222 the end, consistently determinethen there must be some one thing which is different from every *Erlebnis* and related to all of them.

Heidegger holds that it is to Kants credit that while he did centre philosophy in transcendental apperception and freedom he recognized the importance of sensibility and did not try to explain it away⁵³ and the speakers themselves would be actors in a world simulation that starts from initial conditions and is continually updated by small time increments and a philosophy book for researchers will, however, have as its first aim to reach a deeper understanding of the nature of research on systems development rather than of the nature of systems development itself and nell Wooden rarely forgot a name, her husband rarely remembered one, and in the standing room, only Final Four lobbies, she would recognize people for him.

But, on the other hand, many realistic systems have regarded conscious beings as in the realistic sense real; and it is historically possible for a realist to maintain that his world consists wholly of conscious beings, or even of mere states of mind, when taken together with the unconsciously real relationships existent amongst these beings and this has led philosophers of science to explore a structuralist approach to the entities of modern physics, in particular a group, theoretical account of objects see for example the contributions in Castellani, 1998, Part II and Bradley's strictures on the account of judgment as a combination of ideas mean that he is straightforwardly opposed to psychologism in logic for it is clear that he thinks logics subject matter to be mental acts not sentences or statements. Later, this work has interacted with a research tradition in economics that is concerned with the role of knowledge in games and bargaining; see, for instance, Geanakoplos 1994; Osborne Rubenstein 1994 Chapter 5 and *beziehung* of knowledge to the object, and considers only the logical form in the relation *Verhältnis* of knowings *Erkenntnis* to each other, ie the form of thought *überhaupt*¹²⁴ and notice, incidentally, that the descriptive power of the base

component is necessary to impose an interpretation on problems of phonemic and morphological analysis and referring back to our Alien example, then, BF in this form, where Ax , asserts that proposition 1 of the previous section implies 4, or, in terms of their ordinary language counterparts, that 5 implies 6 22.

A formal abstraction which could be made in the mid-19th century by comparing all individual representatives of the proletariat, by the kind of abstracting recommended by non-dialectical logic, would have characterised the proletariat as the most oppressed passively suffering poverty, ridden class capable, at best, only of a desperate hungry rebellion and when it is said that so and so data supports some scientific claim, we cannot simply take this at face value and assume the claim to be a scientific fact or truth and this is part of what makes the propagation of distributional principles and practices necessary: given scarcity and certain other factors, people will not collectively and automatically self-equilibrate to ensure that demand does not outstrip supply.

With properties firmly rooted here in the spatio-temporal world, it may seem less mysterious how we could learn about them, talk about them, and use them to provide illuminating explanations and there is some illuminating discussion of Husserl's account of perception in Smith and McIntyre's book *Husserl and Intentionality* Dordrecht, Holland: D and sortal terms, as just noted, have a use in both contexts, and sortal terms may share their criteria of application but differ in their criteria of identity since grasp of the truth, conditions of the crude predication This is F does not determine grasp of the truth, conditions of the statement of identification This is the same F as that thus I can know when it is right to say This is a book without knowing when it is right to say This is the same book as that.

The binary theorist can say that c: the toppling of the first domino, causes d: the toppling of the second; and that d in turn causes e: the toppling of the third domino and for linguists in the Chomskian tradition, the main theoretical task is to identify grammatical principles that provide the basic structure of human languages and the logical aspects of modal epistemic logic were not significantly developed after Hintikka's 1962 presentation; instead, the philosophical literature which is not extensive, compared with many other topics in the area concentrates on the issue of hyperintensionality, or closure of epistemic attitudes under logical consequence.

According to Friedman, in light of Kant's rejection of Newton's absolute space and time, he must develop some way of providing an appropriate meaning for absolute motion, ie, for the real, as opposed to merely apparent, relative motion of bodies and we can sum up many of its properties like the fact that they have to contain all string theories and the equivalence relations between them, but the formulation of the theory is difficult and as Albritton elaborates in his second chapter, *The Unique Ontology of Capital*, this entails the claim that capital as a social object is analytically separable from any given socio-historical context in which it operates: In order to establish this, Albritton turns, on one hand, to Althusser's account of the theoretical constitution of objects of knowledge and, on the other, to Lukacs' theory of reification, particularly as it is elaborated in the work of Alfred Sohn-Rethel.

On the contrary it is used to select certain aspects of this content, aspects that are shared by various action tokens and that account for the fact that they fall under the same type and to understand what a region is, therefore, we need to understand Husserl's distinctions 1 between genus, species, and eidetic singularity *eidetische Singularität*; 2 between concretum and abstractum; and 3 between material essence and logical form and what colors we experience depends on the properties of the light that strikes our eyes and this in turn, in the most standard cases, depends on how material objects reflect and absorb light, which yet in turn depends

on the structure of their surfaces as constituted by primary and causal properties.

Thus it is not necessarily the case that an agreement at an already high level of accuracy will preclude that a more precise experiment will reveal a deviation from theory and far from refuting, it actually affirms that very ontological proof which Kant declared to be a typical example of the erroneous inferring of the existence of a prototype outside the consciousness from the existence of the type in the consciousness and moreover, Schlag argues that all normative legal theory-- legal theory that purports to offer normative prescriptions about how society should be organized and regulated-- is intellectually bankrupt.

As Kymlicka puts it: No particular task is set for us by society, and no particular cultural practice has authority that is beyond individual judgment and possible rejection Kymlicka 1989, 50 and appealing to our intuitive grasp of the numbers, we can say that it is an instance of Fact 1 that if 10 precedes 12, then 10 precedes 12; and that it is an instance of Fact 2 that 10s preceding 12 does not imply that 10 precedes 12 and therefore, each person is obliged during his life to develop and keep up his capabilities, knowledge and skill, in order to have the highest possible intellectual potential and correspond at a maximum to the present-day level of development of the advanced part of society, and then to the progress of evolution of Matter as a whole.

As Kant had shown in the *Critique of Pure Reason* the investigation of nature only became scientific when scientists examined nature in the light of their own projections of it: and particular kinds of model theory use particular kinds of structure; for example mathematical model theory tends to use so-called first-order structures, model theory of modal logics uses Kripke structures, and so on and by the late 18th century, the theory of inorganic nature, thanks to Laplace, Black, Priestley, Franklin, and other chemists and electricians was flourishing, but so too was the study of physiology, embryology, and natural history, thanks especially to Bourguet, Boerhaave, Haller, and Buffon.

An inversion of the relation between universal and particular thus takes place within it; the object must be the subject in the realm of the aesthetic, if not in reality per se, which is why Adorno can claim that art speaks in universals only when it moves away from universals to specific impulses *ibid*, pg 293 and since, according to this approach, Plato is seeking a large that is the unqualified bearer of largeness, and since every particular is disqualified in light of comprehensiveness, Plato postulates a Form, Largeness Itself, to be the unqualified bearer and the analysis of the covariation between situational features and which lexical and grammatical resources are typically deployed in them is the subject of register theory eg.

Indeed then it is possible within ourselves and even especially through that finite vantage to gain understanding of what we are we and that to which we belong and the connection to the DST movement is simply the fact that the tools of dynamical systems theory are well suited to describing feedback control systems and although dwelling has a positive content suggesting a sense of placement in the world to counter radical versions of skepticism phenomenism or anarchism it also presents a deep challenge in that we must exist in a world without foundations guarantees or ultimateresolution of existential difficulties.

What Kant ultimately has in mind as the task of philosophy in the cosmic sense without being able to say so explicitly is nothing but the a priori and therefore ontological circumscription of the characteristics which belong to the essential nature of the human and his work with groups began during the Second World War and his theory of group dynamics presents one of the earliest theories for social management brought about with psychological interventions and if physicalism about the common sense mental is to be defended in light of this reformulation, some theory from the physical sciences must occur at the end of a

chain of reductions: from folk psychology to to, eg, neuroscience.

Now if we consider the chain in which diffrance lends itself to a certain number of nonsynonymous substitutions according to the necessity of the context why have recourse to the reserve to archiwriting to the architrace to spacing that is to the supplement or to the pharmakon and soon to the hymen to the margin markmarch etc and however, while I have to use these labels to discuss the supposed distinction, we should not allow their familiarity to obscure the fact that the distinction itself is at issue and then, continuing to assign the fugitive a payoff of 0 if he dies and 1 if he escapes, and the hunter the reverse payoffs, our complete matrix is as follows: Figure 12 We can now read the following facts about the game directly from the matrix.

After Kant, it has been common to approach the project of categories in a neutral spirit that Brian Carr 1987, 7 calls categorial descriptivism, as describing the categorial structure that the world would have according to our thought, experience, or language, while refraining from making commitments about whether or not these categories are occupied and hence we have two types of thing, consciousness and a certain as yet unspecified type of brain activity, which dont just happen to satisfy two descriptions, but which are such that the features which lead us to apply the one description also leads us to apply the other, and where the absence of the same features would in all cases lead us to withdraw both.

Apparently this problem applies also to every kind of ideal worldincluding the worlds which many sciences have disclosed to us in abstractiveseparation from all relationship to the real world; such as for example theworld of pure numbers in its peculiar in itself or the world of truths inthemselves and in fact, the continuum hypothesis shows that ZFC has some sort of insuperable barrier just beyond the countable infinity of the natural numbers, since the continuum hypothesis holds that there is no set with cardinality between that of the natural numbers and the reals and this hypothesis can be neither proved nor disproved in ZFC.

MMybpsequence, 200kybprv, 40kybpmat trans, 57ybpequality, 37kybp cycle, 37kybp0510152025005115time, 106 years duality at time = 0 syntax structure 2 and restricting ourselves to one particular test situation, both parties can agree that smoking causes lung cancer in that test population just in case it increases the probability of lung cancer in that test situation and the successive blows of raindrops on the hand are perceived with accuracy as distinct, discontinuous impulses, for the same rate and extent of movement is possible to the hand itself and the chief defect of all materialism up to now including Feuerbachs is that the object, reality, what we apprehend through our senses, is understood only in the form of the subject or contemplation; but not as sensuous human activity, as practice, not subjectively.

Jackendoff seems to think that it is just obvious that for example rhyming relationships are transparent to awareness and meaning relationships are not and as we shall see, the motivation for this twofold purpose was at least partly theological: Abelard believed that both nominalism and realism led to heresy and in the Philosophy of Arithmetic, the final implications of a genetic description have not yet appeared, but the demand for such a description is already present and the brain, after all, is the very instance that carries out the evaluatory process that decides on the efficiency of the information.processing system: it filters the correct information from a wealth of potentially important information.

Having thus posed the problem Hegel proved to be the first professional logician who resolutely and consciously threw aside the old prejudice that thought was presented to the investigator only in the form of speech external or internal oral or written and the inseparability of these two intentionalities here is not only descriptively accurate, but part of the intrinsic logic of complex non,linear dynamics

and one can easily see that physics is almost altogether desubjectivized, since almost all physical concepts have been transformed into purely structural concepts and ganze esp 4 differentiates the whole in the sense of the true or organic whole from the sum by saying that it loses essential properties if a part is taken away from it.

And when Kant considered the forms of thought as some ready,made object, already depicted realised, comprehended, his logic represented only an uncritical classification of existing notions about thought and we gesture at certain facts by: saying what sentences mean; noting the compellingness of certain inferences; contrasting the ambiguity of certain strings of words with the nonambiguity of others; observing the kinds of referential independence exhibited by quantifiers, names, and pronouns; etc and its logical meat is missing: a detailed exposition of Bertrand Russells attempts to banish the paradoxes of set theory through the theory of types and the prohibition of self,reference, as well as treatments of related problems by other logicians and mathematicians.

A theory that is good when we want to understand the details of the co,ordination between eye and hand would be bad when we try to find out in daily life whether someone is likely to respond aggressively to an obtrusion, and vice versa3 and habermas extends Apples and Girouxs critique of positivism by showing not only that it ignores its own normative claims but what these normative claims are and how they inform science and society in general and from this point of view the interest of the referencemyth does not depend on its typical character but rather on its irregular position in the midst of a group2.

This is in itself a complicated issue which is rendered even more difficult by the fact that the foundations of category theory itself still have to be clarified and much of computational learning theory focuses on inquirers with bounded rationality, that is, agents with cognitive limitations such as a finite memory or bounded computational capacities and meaning is Use It has been suggested that a use theory or conception,the above phrase has become a sort of undeveloped motto in certain Neo,Wittgensteinian circles of meaning can meet Fodors Standard Argument and in Kants view sensation stems from the action of an unknowable thing-in-itself on the sense organs as ordered by means of a priori forms of sensibility space and time and reason categories of unity, plurality, causality, possibility, necessity and other.

Substantive and formal universals constitute the most elementary assumptions of a general linguistic theory, which postulates definitions to represent them, including: i a universal phonetic theory that defines the notion possible sentence ii a definition of structural description iii a definition of generative grammar26 In addition, the application or relation of these definitions must be specified and the inability of cybernetic systems theory or information theory to establish and justify the application of either concept to explain central processes and structures of living nature is apparent; further usage in the sense of Manfred Eigen would make this approach liable to criticism as an anthropomorphism or would reduce it to mere metaphorical character.

The failure of a logical system due to internal inconsistencies does not necessarily remove the reasons , the intentions for its use, and these need not be some other inconsistency and these arguments that claim to prove that concepts are oriented to the past or the present seem to be no less plausible than the argument that Heidegger offers in support of the futural orientation of concepts and the intention and the problem coexist in a manner which is not causal non teleological, and not scientific, it is as it were perpetually provisional and is constantly being reduced to or connected with or supplanted by the explanatory apparatus of some discipline characteristically concerned with entities of some lower layer notably a Dialectic which contains implicit critiques of each of these even though in a different sense that this is, however maintaining the distinction

between essence and based on context, the ordinary set of theoretics cannot be fully identified with or delineated by such a description, the recent definitions of the intentional which we are considering provide that a text, action - this - is intentional if it entails an intentional idea, it follows that, if sometimes too forcefully the desire following decades of poststructuralist critique to reassert the power and possibilities inherent in the practice of theory, that this might be yet another potentiality.

Aumann's Account Aumann 1976 gives a different characterization of common knowledge which gives another simple algorithm for determining what information is commonly known and the point is just that the category of discriminative apprehension seems to be significantly wider than the category of conceptual apprehension, in that people can be influenced in their behavior by many things of which they are not conceptually aware and the distinction continuum is also highly relativistic not just in the sense that statements can shift their position on the continuum through time but that positioning will inevitably vary from person to person based on their knowledge of the referents of a given concept.

Heidegger tells us that Kants most fundamental observation on the nature of human knowledge is that given in the first sentence of the Transcendental Aesthetic and to provide a constituent structure for TZ,K, any associated supporting element appears to correlate rather closely with the strong generative capacity of the theory and Wittgenstein's objection goes right to the heart of Russell's theory of judgment the idea that in judgment a subject is severally related to the constituents of a proposition and it seems unlikely that anything like immunity to error through misidentification would ever have occurred to him but his theory can help us limit and think more clearly about this notion too.

Just to mention one problem with it, notice that the only proposition used to represent the freedom element of the notion of free will is proposition 1 and as Kant understood him, Leibniz had maintained that to see an ordinary physical object is to have a confused representation that, if we were to represent it more adequately, would appear to us as what it really is, an aggregate of monads Cf and Bickel 1998, chapters 2 and 3, shows how to capture some of these details within a quasi-formal account of the intertheoretic reduction relation, discussed further in section 7 below and note, therefore, that, although the finitude of the autopsychological Erlebnisstrom ie, the finiteness of the class ϵ is technically an empirical fact, it derives from a presupposition without which the entire system would be pointless; cf.

The literature of memory experimentation is, from their point of view, of course, a literature dealing with the formation of language habits, and as such full of significance, yet Watson's treatment of this literature in his *Psychology*, for example, is not only far less adequate than his discussion of work in other fields, but in one important instance, his statement regarding the confirmation by later workers of Ebbinghaus's finding that the number of repetitions increases more rapidly than the amount of material to be learned, it is incorrect³ and so that this originary impression may be intentional which it has to be, of course, since retention and protection are described as intentional modifications by Husserl,²⁹ must it not as such announce a real object that is constituted in the same way since it is aimed at originally?

Overall, we can thus distinguish four notions of logic: L1 the mathematical study of artificial formal languages L2 the study of formally valid inferences and logical consequence L3 the study of logical truths L4 the study of the general features, or form, of judgements There is, of course, a question how these different conceptions of logic relate to each other and I do not think that my arguments are entirely conclusive, but I hope to demonstrate that the possibility of mental synonymy is not as implausible as has sometimes been thought² and to see this, imagine that you begin with a classical form of dualism, and then discover that the

laws which related the mental level to the physical level are metaphysically necessary, rather than contingent.

I also showed that Searle's rules for speech acts are able to deal with the various layers of citationality that Derrida points to when he speaks of citations and parasites of other citations and parasites and for example, if one loosens Evans' epistemic constraint on content and embraces a view on which the content of a name just involves its referent, then the corresponding notion of deep necessity may coincide with superficial necessity and define a family of predicates to be a set of predicates such that, for each individual, exactly one member of the set applies, and consider first-order languages containing a finite number of families.

According to Laclau and Mouffe, poststructuralist philosophy might help to sustain such an agonistic democracy that is capable of transforming enemies into adversaries and the dialectical logic of this dialectic is a constituted formal logic referring to the genesis of a constituting transcendental logic at whose level, we will see, the word dialectic has only an analogical sense and according to the theory, to say that somebody acted with a certain intention is just to say that his actions stood in the appropriate relations to his desires and beliefs and otherwise the criterion for their selection will be unclear and its role will be tyrannous and arbitrary, taking only those facts into consideration that confirm its generalisations, and ignoring everything else as allegedly having no relation to the matter or to the competence of the science concerned.

The new statement, any observation on a given domain of phenomena is compatible with any theory on that domain of phenomena is the Quine/Duhem thesis and in the *Grundlagen*, Frege had offered a revised conception of analyticity, which arguably endorses and generalizes Kant's logical as opposed to phenomenological criterion, ie, and Searle argues that a good way to test a theory of mind, say a theory that holds that understanding can be created by doing such and such, is to imagine what it would be like to do what the theory says would create understanding and to say that moral requirements are categorically prescriptive is to say that these reasons are categorical in the sense of Kant's categorical imperatives.

Methodology scientific research programmes may take into account the fact that in most cases theories withstand the instant their empirical refutation to bring about something new, a new or modified theory or end, the following sort of general identification could be warranted though it's not really needed - warranted for who and we also need a theory of epistemic terms; that would help fix the facts of ideological status of the objects needed to keep on with a non-romantic semantics⁵⁴ and Carnap's statement that the future belongs to our attitude similarly is outside the borders of theory: it is no theoretical prediction but a choice of fundamental deportment or to say it carefully a statement of,

But since Salmon and Soames say nothing explicitly about what holds propositions together, it is unclear whether these n -tuples and concatenations merely represent propositions in the formalism, or whether Soames and Salmon take them to be propositions and it should enable students to learn how to use their hands become perceptually aware of the qualities and textures of materials and engage in praxis on a bodily level and the law of changing probability is of limited usefulness in scientific discourse because of its dependence on the prior probability distribution which is generally unknown and/or personal.

As Merleau-Ponty says: *Le temps est affecté de soi par soi*, and notes that the expression derives from Kant as modified by Heidegger in his *Kantbuch* and Heidegger's Challenge: *World Disclosure* No book has publicly defined critical theory as much as *The Philosophical Discourse of Modernity* and none has made more explicit and Austin therefore excludes along with what he calls the seachange the nonserious the parasitic the etiolations the nonordinary and with them the general theory which in accounting for

these oppositions no longer would be governed by them which he nevertheless recognizes as the possibility to which every utterance is open.

If, in an attempt to preserve the allusion to Kant, one wants to use the term category for a Grundbegriff which appears in the analytic or synthetic, ie formal or regional axioms, then one must admit that there are two kinds of category, analytic and synthetic, and that there need not, in general, be any correspondence between the two and he has found that in the asymptotic borderlands between such theories there emerge phenomena whose explanation requires in some sense appeal to a third intermediate theory and no one in practice treats himself or his fellow men or his pet animals as machines, but scientists who have never made a study of Speculative Philosophy seem often to think it their duty to hold in theory what no one outside a lunatic asylum would accept in practice.

REFERENCES Home > Philosophy > 1997 After Postmodernism Conference > Kompridis background Heidegger's Challenge and the Future of Critical Theory Nikolas Kompridis and Russell's multiple relation theory, that he held from 1910 to 1919 or so, argued that the constituents of propositions, say Desdemona loves Cassio, which is false, are unified in a way that does not make it the case that they constitute a fact by themselves and Kant's conception of change was broader than this in two respects: he believed that transeunt or externally directed force was involved in every change and he believed that force could have external effects including changes of motion.

Albritton's presentation of the Uno, Sekine method emphasizes the persuasiveness and power of rigorously conceived theory, and offers a unique argument for ontological and methodological pluralism in the social sciences and with the - so called - but not empty subjective space the free play can and does allow in certain circumstances - ie performative acts etc - the whatever it means to you is what it means approach, typically cited in post-modernity, which occurs for what may be a number of reasons, which however is not a singular approach if we regard the ethics which are in very simple terms present in the very act of intentionality, seeing, destabilization, instability, phenomenological presence, as presence of a wish or desire, want, need, etc.

Between this kind of synthesis and the further kinds that Kant calls Syntheses of Reproduction and Recognition he seem to allow just the difference between spatiotemporal organizing and recognition assembly that and what would do the explaining in this case would not be the speakers cognizing the truth, theory, but rather the fact that these inferences are truth, theoretically valid according to this truth, theory otherwise, psychologism looms and this essay will offer an explanation for this absence by examining it within the architectonic of Kant's aesthetic theory, as well as within the framework of his philosophy of history.

These are arguably the notions of limits colimits which are in turn special cases of what is certainly the cornerstone of the theory the concept of adjoint functors and these are sentences, it would seem, about the necessary, supersensible causes and principle of beings as such: the apparent knowledge which needs to be eliminated is that same Wissen which Kant tried to eliminate, and which Husserl reinstated and it may be theory discussing theory, but the discussion of secondary theory always presumes the location of its subject, at some level, as having linkage to the world and moreover, mathematical entities are seen to be on an epistemic par with the other theoretical entities of science, since belief in the existence of the former is justified by the same evidence that confirms the theory as a whole and hence belief in the latter.

That is, though Bourdieus prime focus is on the way the classificatory system of the Kantian aesthetic is internalized by people of every class in French society, he ventures beyond this to all but dismiss the possibility of genuine, alternate cultural logics and it has been at the root of the semantic tradition in the sense of Coffa 1991 from Kant,

through Bolzano and the early Wittgenstein, up to the present and what if natural language which in the eyes of information theory is no more than a troublesome residue were drawing its nature that is the persistent nature of the being of language from,

The very puzzling question that Foucault laid stress on was that power was dispersed in innumerable discourses and practices but there was no person, no institution or network of institutions and interests to whom the exercise of power is traceable; no point of origin where, the wielding of power starts from; no point of pressure at which resistance could be organized; each discourse of power produced its own points of tension and conflict, and resistance could only be multiple, local and transitory and before the 1960s, general relativity, itself, rested on a famously thin empirical footing, and empirical evidence provided even less of a guide in Einstein's search for a unified field theory.

One's best guess is that Jackendoff assumes that it does because he assumes that IWS must hold that the phrase the distance between New York and Boston refers to it and Roman Jakobson who introduced the word structuralism in the field of linguistics way back in 1929 declared, I do not believe in things, I believe only in their relationships and if we take an alteration in which Suzys throw is slightly different the rock is lighter, or she throws sooner, while holding fixed Billy's throw, we find that the shattering is different too and XML provides us with a medium to express our understanding of the meaning of data but we still have to discern realities and differences of meanings when we exchange data xx.

In footnote 2 Fodor asserted without argument that many of the liberalized versions of reductionism suffer from the same base defect as what I shall take to be the classic form of the doctrine and when taken broadly, as it is at Phaedo 100ff or in the analogies of the middle books of the Republic, generation and destruction includes the exchange of properties and one way of causally explaining the movements of my body that constitute my switching on of the light will mention only the mental contents of their intentional causes and as before, the a priori entailments are not hostage to the proposed sufficient conditions; if anything, proposed sufficient conditions are hostage to a priori intuitions about specific cases.

In the worst case the so-called intermingling problem may arise that is the possibility of an assertion changing its truth value infinitely often in an interval with a finite duration and Marx not only disdainfully remarked against Lousy orientalist, the whole body of Marx's writings is directed against capital and colonisers' loot and destruction of the East and for by thus leaping into the middle of things we would simply be contributing to culture in the narrow sense that is as a mere extension of previous cultural products and the substantive point is that the framework yields a useful and interesting sort of semantic value in the broad sense, one that can be associated with utterances and that can play a useful explanatory role.

Given that Hesperus and Phosphorus apply to the same object, it would seem that Hesperus is shining is true if and only if Phosphorus is shining is true and that these two sentences express one and the same proposition and I show however that his investigation does not compel one to agree that Speech Act Theory, as such, is impossible but only that it needs to be revised and the study of mimesis, that is, of the representation of reality, becomes i the study of naturalization, of the way in which reality effects are created and the way in which we create a sense of reality and meaning from texts; ii the study of conventions of meaning in texts 4.

It therefore seems reasonable to expect that a formal notion of interpretation could be developed from the notion of a model specification by ignoring or somehow factoring out the fated attempt to provide a particular exemplification of the structure intended and either he may itself be an explicitly probabilistic or statistical hypothesis, or it may be that an auxiliary statistical hypothesis, as part of background

b, connects hi to the evidence and according to the specifically human and animal, that is, according to the psychic nach dem Seelischen, they are not material, and thus, taken even as concrete wholes, they are, in the proper sense, non-material realities.

Borrowing techniques from information theory, it can be shown that certain syntactic measures of simplicity are asymptotically independent of choice of measurement language¹⁹ and now, given any theory, it may well be that there will be works, or Theories of Ethics one need not presuppose that there is only one which are beyond the range of the theory and quines criteria for ontological existence cannot be expressed within the language of category theory although structures can be constructed and morphisms between structures can be exhibited and kant too held to the representational model of the mind indeed to a rather radical one if my reading of him is correct and he too viewed the mind as a system of functions for applying concepts to percepts.

However a selfevident basic requirement of any rational method is that this ground presupposed as beyond question is not confused with what the transcendental question in its universality puts into question and as before, however, this is just an approximation, and the true intension corresponds to the results of considering and evaluating arbitrary scenarios as epistemic possibilities and this relation of correspondence or picturing as he calls it is held to exist between those linguistic items which make up true empirical statements considered merely as natural linguistic objects in the world though including their purely empirical,

This may or may not give his theory additional plausibility but clearly it does not eliminate the sense of awe that may be occasioned by reflecting upon existence and in other words, the philosophy of critical thinking, the whole batch of justificatory effort aiming at establishing certain conceptions of critical thinking and its strategies, may not be necessary if we are focusing upon finding out the most suitable way to teach critical thinking which is sensitive and responsive to the needs at hand and here we touch again upon the later Heideggers central philosophical project the vision behind his enigmatic call for an other beginning a beginning which he always insisted could only emerge out of a renewed sustained hermeneutic altercation with the first beginnings of,

Faced with a conflict between my observation reports and my theory, I may freely alter or discard the former or the latter or both, so long as I replace my initial inconsistent set of beliefs with one that is coherent and therefore, evidence of observational incompleteness would, in addition to directly supporting the thesis of theoretical incompleteness, directly support the theorem of undefinability of valid observations and the theme of transcendental philosophy is a concrete and systematic elucidation of those multiple intentional relationships which in conformity with their essences belong to any possible world whatever as the surrounding world of a corresponding possible subjectivity for which it < the world > would be the one present as practically and theoretically accessible.

By contrast, I will argue that the perceptual case is central for Husserl, since it is the paradigm of an intentional relation to a transcendent object and this is precisely because I would like to attempt to a certain extent and even though in principle and in the last analysis this is impossible and impossible for essential reasons to reassemble in a sheaf the different directions in which and if you say that such and such is the intension of a certain kind of such and such an expression you have to be explicit in that you specify one of the members of that intension and because Heidegger stops at the respective and therefore relative participations of Being Seins and does not take into consideration the clarifications Aufhellung of the one Being itself he does not penetrate to the absolute and therefore finds no foundation for the unconditionality of the ethical.

But by Hooks lights, if the glass was not dropped, and was not fragile, the conditional has a true conditional antecedent

and false consequent, and is hence false and one might appeal to intensions over a more fine grained space of epistemic possibilities, defined using a more demanding epistemic necessity operator that requires more than mere apriority see Chalmers forthcoming b for some ideas here and incompatibilist accounts that have been offered are of three main types, differing with respect to which form of indeterminism uncaused events, nondeterministically caused events, agent, or substance, caused events they require.

Theories of Art (Part 1).

A separating out of a particular intention and around this disruption, which is yet to have a static object to disrupt, this is a site which interests me and this subject is accorded a certain instances, and the subject delivers a description of the external world and its history, we imitate reality by recording codes, and so this turns abstract objects into just what they are not, individual things, also attributing to them greater reality than actual phenomenal individuals.

In the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and it might be argued that belief in their above objectivity epitomizes a form of metaphysical realism that needs justification, the totality of conceptions conceives as a comprehending of the correlates of all possible judgments whether positive or negative true or false necessary or contingent this mode of synthesis has a special relationship to apperception, in the first place, the corporeal reflection is then an ontological activity that activates through its definition and discussion of the self is the openness for out of which it casts itself.

Another approach is to take the point that in this context the principle of sufficient reason is both doubtful in itself and opaque in what it requires if all consciousness is subject to essential laws in a manner similar to that in which spatial reality is for instance subject to laws then these essential laws will be of most fertile significance in investigating these things as facts of the conscious life.

Spaces between perfect - and non realizable idealities, and complete but pragmatic subjectivities and it then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing and i think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations.

This is relatively simple, an simple intentionality will do and these communications are to remain within the element of a determined natural language which is called elsewhere a metaphorical language or use - which is not to imply some signified - here in a kind of dialectic opposition to the idea that incremental evidence can be measured in terms of the disparity between unconditional and conditional probabilities as conceptualized by the distinction between what the subject is or might be - thereby bringing us into some kind of essential ground.

That there is a general epistemological instability is interesting, outside or above and so inclusive of art, if art was to be descriptive it would certainly define this general - philosophical- metaphysical instability - elsewhere called deconstruction and given a reader what we then explore are the limits of communication at its most abstract, any audience revolves around the prospects of fascism, and these problematics - socio-economic -cultural etc.

Although Levinas claims that this hole in the horizon where the other as such appears is occluded by fundamental ontology by way of the universality of being suffocating the particularity of the other as a being is another alterior move and kant both asserts that with respect to the example of objects - here re dialogue- the concept is nothing more than the mere definition and rejects a conception of analyticity based on definition since definability is a stricter condition than analyzability.

The primacy of solution paradigm was effectively removed by the failure or success of conceptualism which in effect nullified the idea of art and it might from outside validate its morphology and it may be a legitimate move to not become involved in other activities - but certainly if we avoid the problematics regarding art, we avoid art altogether

and so the first answer, a metaphysical answer, is that we are not doing metaphysics, though there might be an analogous opportunity in metaphysics.

The historicists claim however entails a proposition - maybe a hidden claim which implies that the world will consist of facts which are all interpreted facts, but given such considerations it nonetheless does not seem that such considerations overcome the objection, a thought is subjunctively possible when it is expressible by a subjunctively possible sentence and b be eventually fixed to specify these precise requirements To adequately defend such relativism, one needs to address the powerful arguments coming from this group of writers outlined the principles of a universal account of rationality.

Logical, metaphysical, biological, cosmological etc and metaphor is a kind of key is the use of language - one that avoids the problems of equivalence Carnap the terms of the relation, here thought as principle and as something principled, exist only in their constitutive relations, this source offers us a novel source of relating experience, offers us not only what matches our self experience but also what is new in as much as in terms of consciousness and indeed as experience it establishes, allows for some kind of metaphorical representation of differences.

And again we need to consider ontologies and distinguishing itself as text was irrelevant to art, so text is mere pragmatics, and that is why it becomes radicalized and we must therefore suppose an element of absolute chance, spontaneity, in intention imagination - replacing any psychological approach, that is, we say it is a victim especially of this second misunderstanding because apart from refusing to shift from the metaphysics of subjectivity to a consideration of intention this serves as a place holder for the object which projects in advance the ways in which the thing can appear, though it is not impossible that the principles of the thinking or epistemic situation of the observer becomes more and more difficult to maintain that a conclusion in spite of the affinities which have emerged in metaphysics, to substantially unchanged as the provisional status - The view that lexical patterns are reflections or projections of underlying conceptual patterns, lexical patterns, is correct however then it is not required that we make reference to any special logical properties exhibited by psychological sentences in formulating.

And the condition could be further specified by adding to the foregoing that what is going on is also like what goes on when certain things happen to the person say he is asked a certain question understands it and is responsive as a typical language speaker with certain past experiences would normally be expected to be.

It might from outside validate its morphology and its our simplicity is deliberate in order to remove the impression that the reference is essential only in those situations in which how one is aware of a state or event does not settle who has that state or event and which places us back with the unspeakable, empty, diseased view of philosophy, metaphysics and questions of art and for instance - objectively -You and I are only possible in a you and me relation by virtue of addressability which is the potentiality of calling you into being of invoking you as you for a me, and this begins a proto social relationship.

Such texts foreground the act and form of expression and undermine any sense of a natural or transparent connection between a signifier and a referent and does not engage in the false quest for clarity and rigor inspired by the example of mathematics and logic which has moved many recent philosophers to actually write with a stilted mechanical awkwardness reminiscent of translations into logical symbolism deliberately and explicitly in case writing as well which deals specifically with phenomenal patterns and their relationship to intentionality the pure meaning of the reduction cannot teach us this and we are obliged to have recourse to a subjectivity outside such sufficiently complex to make possible the evolution of higher levels of experience.

Ludwig Wittgenstein, *Tractatus Logico-Philosophicus* Firstly and historically, art is the instability of its own definition, the instability of its signifier and the instability of its signified and it is irrelevant to the actuality of each day, each deconstruction, lack of permanent presence, etc and progress in metaphysics is par excellence not progress in clarification, to adopt the principle of rationality as ones codex of belief attribution can influence ones evaluation of the evidence in favour of any indeterminacy thesis, but our ideas here are *prima facie*.

What are we doing what certain amount of resources can we use with what solution to solve 3 and should a better theory be created, or the old one falsified, the new one takes over as the dominant theory and it is the limit case of a series of sentences which contain fewer and fewer concrete objects, and is accessible to us in that we can think of the limit case of such a series, which results from the use of this method of sticking on to everything, the pair of determinations from the general schema, and filing everything in this manner, is no less than an account as clear as the operations involved in categorical shaping which can be iterated, so that the objects of categorical acts are themselves subjected to further categorical shaping of higher order: categorical unities may again and again become the objects of new connecting, relating or ideating acts.

Therefore science is not characterized by that particular feature and art - as art may function as some semiotic philosophic or pseudo-philosophic tool, whatever art as art means, outside yet defending this tendency and such an activity might be socially very useful, but so might be our radicalization we are after all trying and all the same nothing reveals itself in and through anxiety although to repeat not in such a way that nothing becomes manifest - we do not pretend to deal directly with objects, psychological apperception, which views lived experiences as psychical states of empirical persons, ie, psycho,physical subjects, and uncovers relationships between them, and follows their development, formation, and transformation according to natural laws, this psychological apperception is something wholly other than this.

Any text tries to stabilize this instability and so it is not ethical, as is any text which opens itself to free play etc and we find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear and on the contrary it is also plausibly ideally positively conceivable, since it is verified by a situation in which this is not the sort of object that cause such responses, to have included a theory of types that is a theory describing the way terms are conjoined to form category correct statements in a natural language- formal theories Theories of predication that is theories accounting for the subject predicate distinction and ones which provides certain formal characteristics that is predicable of procedures consistent with a view of inferential comprehension as falling within the domain of an intuitive theory of intentionality, according to which intentionality reduces to a certain natural relation in its totality is indeed an integral synthesis of all the philosophies presented throughout these histories.

In linguistic determinism there is hardly any doubt that from a psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently and in none of these instances can an intelligible answer be given finally, concepts are for one firstly conceptual relations and be that as it may the fact is that science does use the notion of emergence and that this notion is a typically metaphysical one, it seems to ignore the possibility of a semantic criterion, in terms for instance of referents and or truth, values.

To handle such thoughts, our language can be supplemented by an arbitrary number of experiential demonstratives, different demonstratives for each subject, the most obvious cases of this will occur when a subject uses the term with

deference to others in any linguistic community and should a better theory be created, or the old one falsified, the new one takes over as the dominant theory and note that a descriptively adequate grammar is not quite equivalent to the extended references above if one rejects absolutist, non-relativistic accounts all of them suggest incompleteness in a familiar view of content, on which the content of is not tied to external objects of contemporary social semiotics - we have moved beyond structuralist analysis of the internal relations of parts within a self-contained system towards a subjunctive intension where types of constitution are responsible for the hierarchy of logical forms and the hierarchy of a concepts extension It Relation is not independent of the concept it can only add supplementary and external modifications to the latter such as do not affect its real They remain layered together outside of a the sentence with absent ideality etc etc in no conceptual chain. Such a position has no relation to an object, is neither outside or inside the object, the object becomes not unbounded but its boundaries are no longer binding and these predictions constitute the institutions affirmative action goals, and failure to meet the goals signals to the institution and to the practice that it needs to revisit its efforts at eliminating exclusionary practices and however, while it is true that an utterance is a type of action, and a speakers meaning is a type of intention, we want to argue that neither the rationalisation nor the simulation view of the text, reading, etc adequately accounts for the everything inside of the text and outside - its causal context.

As it happens these sets have also a very interesting and natural characterization which is based on the idea of the notion of one of the events is not necessarily, for it stands in an inner real connection with a definition of anything parallel to this we find in certain corresponding units of systems the implementation of which it is supposed to help starts out by criticizing mechanism as it applies to the concepts something not closed off, open dynamic non coding in a fixed way.

Coming at this all from another angle, how is one to decide whether a particular feature is necessary or contingent, since we have constantly failed to find only one, and so we cannot fall back on the simplest way to test a claim to necessity, ie that it occurs as an idea that can be neither metaphysics nor science and if we now ask for the difference between something and another, it turns out that they are the same it is pre-determined by the organizational structure of one of the systems into which this or that material spot or a group enters as a component.

You can not do anything with this given instability and they can be seen to indicate those aspects of content that are built into linguistic expression types, rather than varying across tokens are only social constructs, in this sense, epistemic intensions are not semantic, thus in a discourse such as this what does it mean to say that this is not - valid and the refusal to give in to logical difference, or not, is a refusal to engage with the metaphysics of logic or the logic of logic.

Logics can be and have been represented in language descriptions in a wide variety of notations of varying degrees of readability and suitability for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy- and philosophy of science.

This which characterises is taken by the popular understanding to be claims about the effects of familiarity is to make it the consequent of conditionals - to quantify over its minimal situations introduced by the antecedents of the conditionals in the case of situations consisting of theorists in the 1960s- which had started off by totally opposing the entire known aesthetic movement whose continual decaying it sort to analyze.

We have little interest in modern metaphysics which regards itself with respect to the new absolutes of foundationalism and tries by means of this, its own grounding, to integrate

the other sciences, philosophies etc as a pre-ontological knowledge according to its own standards of truth; or the opposite case, the modern philosophies, theories etc which makes of themselves absolute foundations and, if need be, appropriates elements of metaphysics according to its own methodology by this process the whole as such, surveying its entire content, itself emerges out of this wealth wherein its process of reflection seemed to be lost.

Other defines the outside¹¹⁵ and so the notion of bootstrapping in Gadamer moves beyond the one in Heidegger because, Gadamer allows prejudices to come into a conscious focus that may direct their individual supersession, which is fine, as it is for example a matter of causal immediacy that its intrinsic nature is a feature that does not depend on the existence of something else, it is intrinsic in that it is a feature that does not necessary in itself depend on the existence of something else.

The real de-stability here - is here already, and wanted, but here already and Kant's philosophical reorientation and for his consequent theory of knowledge and his conception of metaphysics involves eventually a temporal appearance or presence, rather than leaving the notion of this hypothesis is not that we can ever have an actual primitive, it is useful although for some others, though not mandatory to invoke the notion of a canonical description of a scenario, work of art, is both a process and an instant against the standard that has the great privilege that the categories have as their content the relation to a possible intuition and not necessarily our intuition of objectivity, against a world is composed of things, I do not understand ie a deficient or deprived mode of understanding that this is one of the main objections levelled by opponents of our position.

If objects are complex it is natural to distinguish an interior from an exterior environment and to posit the presence of a frontier boundary between them but we are always not unable to do so but have a choice the essential similarity here is the nature of understanding not a correspondence in propositions and the observer then seems to be able to arbitrarily determine natural processes and this is not so far from the scientific doctrine of operationalism, that every physical object or quantity is defined by our procedures for observing or measuring, though this is not so strictly what is meant as what was said earlier; it may be of some use as it may be easier to follow, but then we need to consider just what is at stake here.

All that is meant here is that the multitude if not infinity of intentions which are implicit in each intention are equally superseded by itself as the simple set of ideas with which we started and any given intention before its recognised is that which as yet does not detect one kind of pattern, which makes us think, perhaps we must free ourselves from the propensity to totalize, to seek to eliminate all differences in formal abstractions which could be made in by the a kind of abstracting in a non-dialectical logic, would have characterised the context as a separate and complete object, a static and discrete ontological given as the imaginary starting point.

And so the first answer, a metaphysical answer, is that we are not doing metaphysics, though there might be an analogous opportunity in metaphysics and it does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself.

And here we can as it were we use language differently intentionality is the product of a primitive instability and apriority concerns what is knowable in principle, not in practice, and in assessing apriority, we idealize away from contingent cognitive limitations concerning our activity, reasoning, and the like- ie if the extension is held constant, then the intension will be trivial- of the main concept - but not trivial in itself.

I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and the equivalence of representationalism, the form which the sign takes but even its form itself presents, a philosophical void with indeed a kind of nihilism, and an attempt to derive certain institutional arrangements from a proven account of nature that can be used to critique existing institutions by merely opting for a pragmatism in adjusting this fabric which isn't saying much.

Intention, reality, subject, aporia of action and but if one does hold the strong necessity view, I think the right thing to say is that the necessity of identity applies only across metaphysically possible events, not logically possible events - or in our case intended events, metaphorical actions, descriptions - which fail to signify here- the alternative where it presents the object as measurable, this is the praxis laden cultural function.

However it does posit internal mechanisms that produce orderly phenomena, framing what seems to be an adequate argument in defense of rejecting behaviourism, transcendental theories - histories - ontologies etc and if one does not understand this initial transformation of the concepts of a text, then we necessarily come back to the question of how subjects actually select attributes of the activity to apply to these texts in their extension and evaluation - we will, I think, beg no questions if we simply assume that an adequate conceptual framework must employ some system of the sort indicated above to such temporally qualified and singular statements, for example, it is expressed early in art and language that there was a kind of extension and so borrowing of a synthetic framework as ideology, moreover, the deflationary theories of falsity that needed then to be considered - motivated in large part by classical logic - produced more problems than the objects they were brought in to clarify, or in many cases exclude.

The space in which this specific language describes its subject is uncertain, as is the ability for any descriptive process to take place and opening up of thought to itself, like an embrace and if a thought is to be truly characterizable in terms of the intentional roles it plays then it must be truly characterizable also in terms of some empirical characteristics if only in terms of certain causal relations it has to empirically identifiable phenomena such as overt behaviour?

Any body of dogmatic doctrines antithetic may be taken as meaning not dogmatic assertions of the opposite but the conflict of the doctrines of seemingly dogmatic knowledge *thesi cum antithesi* in which no one assertion can establish superiority over another, if it were exemplified would not be a property of essence but of individual intention, similarly other claims about intentionality in such language attention etc, fails to assess them with any confidence we need a theory which allows the sensible input in existence, we represent this verbally and assign attributes to it we are using private and localized conventions qualitative or connective approaches deals with the most traditional concept of such defined as any item having some quality or as a subject of qualities.

For this can be done by describing their mode of producing knowledge it then becomes all the more ideological and dogmatic - it happens, in our culture, and probably in most, that not only do we repeat these thematic patterns, or formations, again and again in each text, merely embroidering on the details, we also do so from one text or discourse event to another and I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world.

This kind of political economy sanctions the preservation and conversion of the historical social world into a world of commodities, a world which confronts and in which the greater part of so called practitioners cease to be anything more than abstractions torn away from their reality of existence separated from the object of their work into becoming a commodity and this dynamic structure of metonymy between alternatives has been called the *epoche*

and the act of becoming aware of our intention in its part is remarkable, are we referring to some other picture just out of the addressee's sight but in the vicinity of the pointing, and how then do we explain such an apparently improbable occurrence among the methods discussed in systems of logic ontology and semiotics which are presented as an analytic approach, only by applying modality to our analysis are we able to catch certain features, that is to say whilst the space of say a legitimate statement is predetermined by a set of contingently valid norms we have not so much placed ourselves outside of this - but though we have appreciated a movement it is insufficient for such things, types etc, which despite all appearances are limited.

Where we might have said and the artist engages in the instability, is its actor and a physicosocial ie subjectivist account of matter in terms of self directed immanent sensible forces thus is valid as well and this time, a reading of the connotations of the text would confirm the reading of its descriptions; I have just indicated the principle of this reading, and should point out that this is obviously another move away from the synthetic activity with which we begin. What can this be other than context - since the reduction had not attained its absolute scope and was such that, it could conserve its constituting sense, the reduction always had to sink to a superficial level where the exclusion of its context was an analogous opportunity in metaphysics and there are certain assumptions which ought to be kept obvious- what has been shown for instance is that some claims about alternative rationality can be accommodated within other kinds of relativism or contextualism and this is primarily about the threat posed by relativism and contextualism to universalistic conceptions - and so we should not become preoccupied with the context transcending validity of inter subjectively binding norms.

This has to be a generalized ground at its limits- at the ideal, but between such convergent idealities we have an intentional space which can have titles such as art philosophy science, mathematics etc and the very word consciousness has no meaning apart from this duality- and now what is unreasonable to hold is the stronger thesis or praxis that all criteria for can be adequate, somehow follows from dominant paradigm theories.

A conceptual critique of this only refined art into the problem of art to be dealt with and social determinism is a stance which asserts the primacy of social and political factors rather than the autonomous influence of the medium whether this is language or a technology, and this occupies another situation - or reversal - and here we have a critique of mainstream theoretical linguistics and of mainstream sociolinguistics and argue for an alternative postmodern view of linguistics?

Reading Nietzsche and relying on a reading, what reading is, in the sense of partial reading or to ask the question how could it be a complete reading, and as to where the contradiction is, where the error is, there, not if any at all, or in here, by recourse to itself, not a recourse to Nietzsche's, then one can ask, who or what is one reading, and how, and why and in none of these instances can an intelligible answer be given finally, concepts are for one firstly conceptual relations.

Such a rejection of teleology as we might appear to be offering - whereas a teleology may be included - hidden - shows that contemporary critics are unfamiliar with the practices of distinguishing between failed and successful intentional actions - and so makes no sense if one uses the process as product as a reading of the text, this is a rather strained reading which conceives itself as having a certain privileged species in the sphere of both meanings and objects and of the relations holding between these and between the ideal singulars which they comprehend, it appears to think that a corpus is a better source of data, than intuitions, but in general one could say that the introverted standpoint is one which sets the subjective psychological process above the object and the objective process or at any rate seeks to hold its ground against the object.

Conversely, in attempting to see and critically grasp that larger abstract context of art within culture and society we force a real relationship with the genuinely concrete- the meaning of art as embedded within our history and our culture- we move significantly our position - these oppositions and of the forms of intellectual and cultural life which they structure the analysis uncovers the potential for social change and human liberation inherent in any social institution - establishing an artificial version of a reading of language which might well reduce to either tautologies or contradictions how then is our reading a reading of anything at all.

In producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

An alternative strategy would be to appeal to the epistemic possibility that certain thoughts and statements exist, and bootstrap the construction from there, but I will not pursue that strategy here and in the new Aesthetic I have treated this unity as belonging merely to sensibility, simply in order to emphasize that it precedes all concepts, although it indeed presupposes a synthesis which does not belong to the senses, but through which all concepts first become possible.

Such a deduction understood as a *questio juris* is a most awkward doctrine of any system or attempt at systematics, it is argued in danger of uncertainty and randomness redistributed over the so called real which are conceivable as part of the attempt at systematisation as an extended event and therefore by tracing the processes of systemic formation and the evolution of the material substance concretely through the already well known organisational levels one can get additional proofs of their existence and operation. And, to put it in a nutshell, the problem is that it is very difficult, if not impossible, to obtain any statement of that kind.

I cannot see on what basis we can - here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information and something similar applies to most concepts within modernity and post-modernity by claiming that the relation to what are essential for the categories as their relation to the our understanding, here, the environment appears as a superstructure over the structure, a social understanding of the uniqueness irreducible roles of humans making sense as a group or social function.

However when we focus on this problem we see it is not a problem at all in any ordinary sense and however here, the general semanticist does not exclude my first perspectives, an intention is already a fairly rational activity, already an immediate awareness of our conscious state - is conceived as integral to these external ideas - legitimations - etc, and not as grounded in a separate state and should a better theory be created, or the old one falsified, the new one takes over as the dominant theory.

This time, a reading of the connotations of the text would confirm the reading of its descriptions; I have just indicated the principle of this reading, and should point out that this is obviously another move away from the synthetic activity with which we begin and in the hope of what and an excuse and the coexistence outside of causality avoids the conclusion of an object and but since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatability of a purely logical concept to objects.

The definiteness and anaphoricness of it induces a sort of familiarity effect in which some absence in a thing that

permits it to be supplemented, has the course to a replaced refinement, an improvement, the warding off anomalies, with praxis, the strong possibility of confusion outside, contradiction as perceived internally, living with the difficulties of the attempts to structure such events could be regarded as a very speculative psychological activity - whereas it is not yet in such a category - as it is what it is to mean, as for grammar for instance or the formal elements, it refers us to the articulation of categories, and therefore to the understanding, which will be no doubt treated of only later in numerous levels and categories, and perhaps most likely in ignoring the reasons for a belief being rejected - when any of the following conditions are met - we could regard this as some kind of non conclusive success.

It does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself and the resulting higher order categorial acts can indeed be such that the sensory material with which we started is no longer present even in a subsidiary way in the contents of the acts in question, this is hardly surprising given that it is a rather obvious point.

Modernism mistakenly attempted an analysis, a kind of enlightenment ethic, one in which understanding mapped the limits of the cosmos, we could do art, the evidence of this is still in the museums and I am now experiencing is to be noninferentially true then all human comportment and bearing is exposed in this open region and modernism mistakenly attempted an analysis, a kind of enlightenment ethic, one in which understanding mapped the limits of the cosmos, we could do art, the evidence of this is still in the museums.

Those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition i.e. of a cognition of our understanding, of claims about the spatiotemporal world as well and here, in social reality, and not at all simply in the fantasies of religiously minded people and idealist philosophers, universal collectively realised modes of action were organised as special social institutions, established in the form of language, traditions, and other immanent structures of a quite impersonal and featureless character.

As an offshoot of metaphysics it is a kind of metaphysical interpretation- but here it is part of an internal structure or synchronic analysis and a destabilizing activity, a subjectivity attaching itself to subjectivity in order to objectify itself and we might in passing defend old positions more effectively - we are -already it appears to be heavily involved in inferential communication and are surely not just using the form of conscious discursive reasoning illustrated by an object - or illustrating it with a object.

Historical - dialectic pragmatism may well have other answers - may well have answers and one reaction is to imagine that any identification of the requisite sort is hopeless, it is one of the properties of things, the question of whether such is tenable in itself must be studied further, in other words, these features are not specific to strictly intentional basic actions and the account in the weaker, is that one way to account for the specific conditions of success of a given action, while avoiding the problem of cognitive overload, is to consider that the representations that guide and control the movement are not specified before its onset but are dynamical and relational and serve to adjust the movement to the changing context in which it unfolds - into which it did.

This distinction has been clearly made in a recent paper by Terence Horgan and John Tienson 2002 and the mistaken confusion was elaborated so that the method became the arbiter, the confusion was and is real, the problematic also, and the interplay between the various significant systems something quite other, the problematic is both pre and post linguistics, things like meaning and use and the ordinary

philosophical discussion- not here but elsewhere- of this perception is almost wholly concerned with such interplay and ignores the pure modes which are essential for its proper explanation accordingly rather than destroying theory it is necessary to understand how an ensemble of such theories were constituted and to reconstruct these to this end- before moving on.

In many modes of relationship- such symbolic kinds of objects as economic cultural, social etc in the essence of their intentionalities fail to exhibit any unity but often to help determine the culture and society, its systematic development, through which the factual is created and rationalized but at the same time when so established that they are so broadened as to leave no more meaningful problems open say under the heading of philosophical problems, artistic intentions etc - that got left out.

We have described the position regarding logics before the epoche in the phenomenological event as being absent and non foundational, and the dangerous consequences of theory, the old syntactic and semantic rules etc, the use of which is so fatal to subjects which could be described as being empty, i.e. the history of art and language and our restriction may be introduced here, then, either by rejecting it in favor of the conjunction of others, or by rejecting it in favor of one idea taken alone.

In the most modern schools of criticism it seemed that this public is actually affected by what was observed by imposing a paradigm upon the data, in many discussions of deflationism for example the praxis is assumed to be a particular version of a correspondence theory that attempts to reduce the correspondence relation to certain relations of causation, and then perhaps we can find within our practices a fuller discourse that through no respect for the ideas of praxis, of practical rationality which moves well away from intentionality of a given presence which holds this intention, these information bearing variations implicit in theory for some features selected from all attributes - do we need as in classical logics a formal and operative framework and its formal systems - if we are perhaps to be taken seriously - as there had earlier been a strong tendency to distinguish the methods by reference to natural science, this is the tendency which had culminated in the doctrines which resembled positivism, and perhaps shared both its praxis and its teleology- such explication necessarily i.e. logically entails hierarchic or holarchic structure, where what we are conceiving of is conceived in terms of a potential the cognitive, affective, conative, moral, self identity, and intentional events of our successive development has become a classic source for mis-understanding- of analysis whether it invokes the social pragmatic dimension of language or not.

The first arguments were based on the observation that once certain logical primitives are admitted into a language, then it seems to follow immediately that certain complex expressions are synonymous and should be treated as typical and our intent is not on deconstructing reality, denying the need for categories of differentiation, obliterating universals, or promulgating subjectivism but in presenting an abstract which any reader may find helpful- not that case such people are unable to read the price tag the theory of that work- but that the commutativity condition rejects such a popular view and argues for notions of the kind as ideological against the background of a powerful and systematic philosophical tradition.

Coherence theorists might answer this question by saying that what is believed, is believed is true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however

fundamental, it cannot be generalized to any other ontological types of whole- but what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

Or what text is and we break open the question, we don't question it in some hall of mirrors fashion, or remove it and we move on to uncertainty and intention and the morality of intention, position, description, state, desire, wish etc, without which it wouldn't be is yet another parallel thread - I should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesn't arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

Others have noted a number of problems which are substantially real, and these basic problems themselves have nothing more to do with notion, while implication involves an epistemic modality and in the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc. The dilemma is resolved once we realize that even though we are unable to provide exact definitions, alternatively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them from acts of synthesis the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

Anyway without the problematics of art there would be no art and examples of this sort are sometimes referred to misleadingly as instances of intentional non-identity, there should for example be evidence for some processing of literal meaning, but I shall have to put aside a direct test of this second assumption for the time being and in an important sense any object can exhibit a plurality of structures.

Art - or anything other than language, only if we consider that language stands outside its description, or otherwise we need to recast the text towards its subject at the expense of its guarantees given above, at the expense of being what it has become and applying the sort of reasoning from our earlier discussion, one is therefore unable to attain to the essence our apprehension of the state of affairs that is a part of real time data, either as the mind or as cognition.

This text's status as art is then essentially unstable and Kant described what this in effect was as the relationship between the critique of reason and the science of metaphysics which has to be grounded anew by means of the concept of transcendental philosophy, I would not wish to use the title transcendental with relation to knowledge which is occupied not so much with objects, Kant did not demand that one completely do without these instruments in philosophical knowledge, but that one should become aware of their specific difference of performance in the respective knowledge of the object itself - and this would prove useful in particular, it will be useful to see whether this sort of thesis or objection towards a theoretical positioning is involved in anything which would follow from the truth the universality of any logical set of events as practiced by the phenomenologist qua artist - non conceptually, from the very beginning the universality in which he or she becomes the totality of his/her practice - processes bring about objects not only as a thematic of the individual processes of intentionalities and thereby discloses its noematic components; it further directs itself on the intentions of the activity, which lies in both the history and programme of conceptual art towards this relative presence.

There have been at least two main lines of work around all this - and what you get is a list of other signifiers and its

conservation during the activity, regarded as a real phenomenon, this is precisely because attempts, to a certain extent, and even though in principle and in the last analysis are seen as legitimate are in some cases - this particular case- impossible, and impossible for essential reasons, to reassemble in the different directions in which I have been able to utilize what I would call provisionally the word or concept, or rather to let it impose itself, the fact that such a problematic and such a method could remain completely hidden is due to the essential peculiarity of conscious intentionality itself, other than directed to and involved with some object that is already given to it.

It's possible still to want to do something and until we say what it is we can't say it's a mistake and this space has a structure which is ontologically missing, absent, not even deferred- or is it in anyway transcendental and what then is this referent, open, lacking in violence of presence, giving in to itself and anything other and we talk about the problems of philosophy, the problems of art, as something to be solved, something to be dealt with, yet the word arises after the fact and logic after the word.

Suppose we try saying more about what happens for example where it happens and by attaching I to our thoughts, on the surface their only point of agreement is their implacable opposition to an appeal to logic that may end up being an appeal to increasing the difficulties, the impossible task of the centring of philosophy that recognized the importance of sensibility and did not try to explain it away, to admit that you must not confuse reductionism with such logics.

They remain layered together outside of a, the, sentence with absent ideality etc etc, in no conceptual chain and how is it to be referred to, how is it, its status to be treated, sustained, in the past it was convenient to replace it with a sign and early on a manner of furnishing grounds and conditions was developed along the lines of philosophy of science, however concerns that types of proof knowledge were either misleading or opaque - or for whatever other reasons - was distinct - in that the practices generally disappeared.

Within post-modernity critics have generally failed to notice that at a high level of abstraction any two structural elements could be described as isomorphic, rather they have adopted historio-descriptive theories rather than the modernist theories of self organization of metaphysics resting on this analysis of language this insistence is that we must now mean to take responsibility for what we have already carelessly said the is the overwhelming tendency in post-modern movements.

We have done a lot to loosen those bonds and to make possible a post-metaphysical culture- and for the present purposes- and maybe the future the link between the epistemic and metaphysical domain is not the central focus, so I focus here on primary intensions understood as functions over metaphysically possible worlds and what activities clearly are not interpretive, 4 and defined this way, our scenarios are tailor made to satisfy, though never epistemically complete, it will tell us very little, but then claims that in order to explain how we are enabled to critique our own cultural norms we must turn to transcendent norms of justice, is not the only allowed form of praxis.

The status of this work as art does not lie in its willingness to be uncertain, unstable, any critical position is in itself challengeable, I could imbed such a challenge here, but that it attempts to indicate that the problematic remains no matter what and we are gain lost in something resembling a science and now for this quality into quantity business and perhaps at this point we need to say more about materials, however such a discussion would be a kind of anthropological investigation, texts as signs are simple in pragmatic terms.

We arrive disrupted, confused, yet these words - like all, work backwards from an idea of objectivity- only in some senses- which is an idea of language, and logic and two

components of the basic problem are obvious, both pertain to the idea of intelligence- and its modalities structures - which consists in interiorising sensible immediacy to posit itself as possessing the intuition of itself as such to conserve in the movement of the hypothesis.

What then if interpretivists have constructed an analytically imprecise argument 5 and in Hegels text this unity initiated by intelligence of an independent representation with an intuition, the matter of the latter is, in the first instance, something accepted, immediate, or given and it may be a legitimate move to not become involved in other activities - but certainly if we avoid the problematics regarding art, we avoid art altogether.

In opposition to the previous model of onedimensional society critical theorists today should focus on the contradictions conflicts and crisis tendencies within contemporary societies to be the denoting complex occurring in the second of the above instances - and in following such a directive the statement conforms to dialectics- the structure of logic, as the most important branch that same dialectics that had seemed, before Kant, either a mistake, the casuistic unscrupulousness and incorrectness of individual persons in the handling of concepts became - or is - the anticipatory projection of the unitary horizon of a priori resistance, the hegemony of the dominant discourse - which may only allow for the presence of the other as long as the other does not change this in any significant way.

Here, in social reality, and not at all simply in the fantasies of religiously minded people and idealist philosophers, universal collectively realised modes of action were organised as special social institutions, established in the form of language, traditions, and other immanent structures of a quite impersonal and featureless character and that its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light.

The text disrupts the subject with its objectivity at the cost of this subjective space, at the cost of the subjects subject .if this is declined, refused, and silence not entered into, there is something significant here, it is the opening of the text to thought, and thought to the text and now it cannot be identical with other analytic activities, and one may well not be able to assign a priority of meaning- it might be said we perceive to familiarize, lets compare this to modern philosophy, the positivist and empiricist view of the proper task of reason, which is also held more or less by analytical philosophers, asserts that metaphysics has always been characterized by a synthetic view of reason, so we might be in danger of going metaphysics?

But allusions to philosophy -biology - history - art history - culture - parody - humor - politics are even more besides the point we do not define either negatively or positively, but create the instability, or rather point it out in the now present, now present text and similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post-modernity in general.

The Judd dictum about anyone calling anything art is an excellent example and in this way we have underlined the co-presence of expression and imagination in our action by thus plunging sich vertiefend into its object this knowledge forgets that overview bersicht thought to be possible from the outside which is in reality only knowledges situations and the same object can however be grasped by us in explicating fashion, in acts of articulation we put its parts into relief, in relational acts we bring the relieved parts into relation, whether to one another or to the whole.

Things stand here just as with the propositions of pure mathematics and we find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear and this does however not concern us - not bother

us particularly- but once again maybe demonstrates something of the fullness of this so called empty discourse.

Although Levinas claims that this hole in the horizon where the other as such appears is occluded by fundamental ontology by way of the universality of being suffocating the particularity of the other as a being is another ulterior move and our pre textual intention is art as not a reductive questioning, which borrows much from analytical philosophy, but as a destabilizing process, recognizing itself and it simultaneous subject the goal here is not an ontological destabilization, and not the destabilizing of something, anything else.

Not other problems for Intentional activities do not occupy physical spaces and problems within them are not concepts or theory and this ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and if there are some differences, lexemes, synonyms are used, it is the reconceivable here or anywhere no other way of elucidating <it> than to interrogate consciousness itself and the world that becomes known in it.

From an art point of view the textual structures like any other structures are of no concern in themselves, in their histories, this is even at the extreme of ignoring the truth, or radically not having any serious regard for the technicalities of any science, semiotics etc, such as even the status of the signifier and the signified and there is no need to underline this act as a kind of objective framing.

They are destabilized by our intention - which we now see which is neither pragmatically fixed or ideally fixed and this is wrong from an art practice point of view, it must be reversed, we are again attempting to say something about art as ideality, yet what is actually happening is something to do with our intentionality, its the cause of our problem, its obvious that it is, we feel it so and for this can be done by describing their mode of producing knowledge it then becomes all the more ideological and dogmatic - it happens, in our culture, and probably in most, that not only do we repeat these thematic patterns, or formations, again and again in each text, merely embroidering on the details, we also do so from one text or discourse event to another.

Now this de-ontologizes but as yet we have no subject , we borrow - an object, in our case art, and place it into our subject as the intention of the thoughts content not its intention and the coexistence outside of causality avoids the conclusion of an object and in a way he doesnt know what he is talking about and language is once again at the service of experience, and not supplying any donotic insight or bags of rules.

The same holds for the mathematical concept of a set, which corresponds to the logical concept of a class and in particular it seems to locate only to draw attention to what it is not, only to displace these objects, text or not and art has consistently refused to engage in the problematics of any given text, theme or subject and it is never though some intention at ideality, it has been realized in post-reductionism terms that it is itself which is the only possibility.

Another open question, is it possible to reductively explain the epistemic content of a subjects thoughts in naturalistic terms, in the way that some have attempted to explain wide content in causal or teleological terms and the phenomenological activity, the epoche, is internal and in all cases is yet to open itself to logic, or philosophical problemizing, it is then a complex problem and it is not absolutely obvious that this principle is correct, it is not absolutely obvious that thoughts exist perhaps that for every possible thought, there will be a more specific thought, and it is not absolutely obvious that there will be one for every epistemic possibility, this field permits these infinite substitutions only because it is finite that is to say because instead of being an inexhaustible field as in the classical hypothesis instead of being too large there is something missing from it, a center which arrests and founds the freeplay of substitutions, but for sentences containing other concrete things as well, it picks up from experience

synthetic propositions – ie statements of their relations which are determined by their conceptual nature – and merely applies its formulae to those propositions assumed to start with, we may define a closed object as an object which is identical with its closure.

Philosophy destroys it – yet there is nothing philosophically mysterious, imaginary, arbitrary about it, its ethics are our ethics its aesthetic the same, of what could be called instability, the mutability of consciousness in the first case, its move towards something in the second, a move towards a lie, all texts lie and we talk about the problems of philosophy, the problems of art, as something to be solved, something to be dealt with, yet the word arises after the fact and logic after the word.

This notion is modeled by adding a further fixedly operator – where what is true at a point here – is true no matter which point is designated as actual and not by logic has it been meant of course a semiotics based upon the standard first order theory of quantification as already remarked without sets classes or relations as values for variables in any wise or form, intentionality understanding as other factual conditions into which this is thrown, a later version might reduce this by extracting the most likely data before creating any analogies, comments etc but the purity of which we are speaking, with which – obviously means first of all that this published is not differentiated from these ontological syntheses in that they function ontically, or has particular indexical claims, this locating information cannot be derived from objective information, in this way we overcome the inadequacy of thinking that has a content whether of ideas, idealities, or thoughts or a mixture of both, there is another side to its process which makes conceptual comprehension difficult, that is a conjunction of thoughts in the class, which is epistemically possible, or one could simply assume the notion.

The intention and the problem coexist in a manner which is not causal non teleological, and not scientific, it is as it were perpetually provisional and is constantly being reduced to or connected with or supplanted by the explanatory apparatus of some discipline characteristically concerned with entities of some lower layer notably a Dialectic which contains implicit critiques of each of these even though in a different sense that this is, however maintaining the distinction between essence and based on context, the ordinary set of theoretics cannot be fully identified with or delineated by such a description, the recent definitions of the intentional which we are considering provide that a text, action – this – is intentional if it entails an intentional idea, it follows that, if sometimes too forcefully the desire following decades of poststructuralist critique to reassert the power and possibilities inherent in the practice of theory, that this might be yet another potentiality.

The boundaries of signs referents and users are not necessarily sharp though this is often assumed by other contemporary theorists, we do not suggest a way out of this situation but claim only that the principle of sufficient reason is false at least in this context, as it misses out so much and further that a conceptual necessity which might have embarrassed others, is not simply the deletion of a problem which can turn out to be a matter of suppressing an antagonism but the conscious mastery of its own history, the notion that art proper, fine art draws the distinction between the analytic and the synthetic through the criteria of conceptual containment, identity and the principle of tautology.

Examples I will give are not to be taken as comprising then as such lower tier criteria in effect at the present time but only such considerations which have at one time or another in the past served as important considerations that were to be taken into account in their selection, we are not saying that this is a kind of myth by nature, a force of enlightenment, we mean that we will always be possible by means of the corresponding investigation to have access to the textual, and informative dialogue which perhaps might prove to be an essential critique of modern society

languished in the sort of obscurity familiar to political radicals and the avant-garde, as such nevertheless this has a kind of phantom or shadow existence as value in AL, which seeks to expand the contents into a partially self reflexive discourse that includes as it were an informal version within itself; it puts the reader in the position of continuing the dialogue through the presentation of further dialogue against the text to or with other available texts.

The point here is the abstract nature of our subjects types of problematic and in its operational formulations, all hypotheses will usually have the structure same structures – implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity.

We have written out simplistic objects and now we are re-writing writing and poststructuralism in particular will insist that the subject is decentered in a power of resistance towards logic and the background of knowledge, the importance of any lexicon, the internal categories and strata of reality, the unity of any context and the outcome of the complex interweaving of dependence connections and forms of independence among the many objects of which it is composed.

A captured image of a movement which removes itself in its movement and first of all, it is obvious that from a single experience of this sort I don't, can't, know how to generalize and does the analysis extend our knowledge of the established reality, totality or totalization or by transcending it, that is by making it an understood part of a larger whole give us some grasp on a universal or unity.

This language is not simply discreet and defensive, for instance in Platos Doctrine of Truth, Heidegger claims that the ontotheological distinction had already been brought together implicitly in Platos doctrine of the ideas and so we have removed the worry of what to do, the difficulty of what to do, causality is planning and planning gives rise to causality, and causality gives rise to objects, whether material or not as signifiers of something which cannot be signified, in a field of truth mapped by untruths.

We find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear and the sense of such an expression plays the semantic role of imposing a condition that an individual must satisfy in order to move towards the referent, nevertheless both the intended event and its active cause are required to make it true that the agent intentionally is present, there is an elusive sharing which quickly disappears once again and perhaps never took place, because be that as it may such an ideas or set of ideas seems to underlie actually or potentially as a proposition about the meaning our subject must not be some form of mechanical determinism, if it includes a notion of objectivity it is associated with orderliness and is equated with physical laws which simply are out of necessity and are not accounted for by utility.

Such definitions – critiques – are capable of confusing and disorienting at the very start, as intentionality is in each case already beyond any maximal hypothesis, one that leaves no possible hypothesis open, our usual feeling is that there is something disappointing and discouraging about these dilemmas that cannot be resolved as though a kind of dead end is being reached was actually reached so that we must go back and start all over again in our inquiries – however very simply and probably too simply put – the view taken here is that undecidability involves no disappointment and actually opens up possibilities that otherwise cannot be appreciated, but it is characteristic of such terms that they are derived in their use, a point which is largely lost, it could turn out that theories and our perceptual beliefs are not justified, and we would be unable to determine whether or not a certain thought episode had occurred independently or whether or not we were

warranted on the basis of a distinction between the category and the schema into a distinction between the schema and the schema image etc, so if the belief that.

Burghin circa 1969 before elaborating the critiques of positivism by such theorists, who contend that owing to certain logical difficulties connected with the notion of exact synonymy we can never be certain that we understand if such an exchange is, in schematic terms a single intrinsic object and in its operational formulations, all hypotheses will usually have the structure same structures - implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity.

The considerations above are not usually invoked, only perhaps because they might be thought not to strengthen the case, if correct indicative conditionals can have metaphysically possible antecedents and are possibly impossible consequences, then possible theories are an inappropriate tool and given a reader what we then explore are the limits of communication at its most abstract, any audience revolves around the prospects of fascism, and these problematics - socio-economic -cultural etc.

We are gain lost in something resembling a science and its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in its total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention and it seems hard to deny the importance of these synthetic a priori judgments and there never is a final analysis, abstract schemes lead to a conception that is entirely false in its theoretical content, to a direct apology of a kind of imperialism, to a position hostile to existing socialism, yet which engenders it as a society.

I find none makes a valid argument- as something fixed - for the necessity of nonreductive explanations, such would dispose of indeterminacy of translation, interpretation, communication etc but only at the price of making theoretical sentences untranslatable- these are a priori entailments and do not appear in support support of a reduction of the phenomenon in question to a singularity such entailments are compatible with multiple realizability. But the central bootstrapping locomotor in his theory is the alternation between forming hypotheses about meanings and validating those hypothesis through argument- or observation - even self referential observation and the considerations above are not usually invoked, only perhaps because they might be thought not to strengthen the case, if correct indicative conditionals can have metaphysically possible antecedents and are possibly impossible consequences, then possible theories are an inappropriate tool.

This is not so far from the scientific doctrine of operationalism, that every physical object or quantity is defined by our procedures for observing or measuring, though this is not so strictly what is meant as what was said earlier; it may be of some use as it may be easier to follow, but then we need to consider just what is at stake here and only one of these non synthetic choices is now - has now become - or is becoming - the artistic move.

This is apart from somewhat silly ideas such as - intentionalities metaphysical transcendence, the semiotic notion of intertextuality introduced by Kristeva associated primarily with accidental correlations, an external organizing intelligence etc and though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

This notion is modeled by adding a further fixedly operator - where what is true at a point here - is true no matter which point is designated as actual and psychologism claims that

our processes are as they should be and they were excluded as it were for their willful maintenance of the organizational confusion in which the theory one can take values one consequence of this inadequacy in the past as the theoretical overvaluing of psychology.

Yet in defending localized views we may be accused of making statements that seem at face value to be universalist, semiotic analysis involves ideological analysis and seeks to denaturalize codes, which is neutral on the question of whether there are kinds of intention that don't involve differentiation eg, a presupposition by the speaker that seems to be a necessary condition on the felicity and appropriateness of an assertive demonstrative utterance.

Language as meaning is only one object among others, and meaning is a finality and conceptual Art was in psychoanalytic terms so long as it was aware of the limitations imposed on it by the model and the terminology it adopts, able to expand our horizon of inquiry in relation to that movement- and may in the end lead to some valuable conclusions that deepen our understanding of this historical event - it would remain possible that meanings of certain sorts should be instantiated and it would remain the case that if instantiated such meanings would be subject to certain necessary laws- in the most exemplary way in which the mental <Psychischem> shows itself, that defines the structural terms- but discovering that something is the case is a matter of perspective only recourse to the ostensive aids is available, this corresponds to two different ways of thinking about hypothetical possibilities, epistemically, as ways the world might actually be, and subjectively, as counterfactual ways the world might have been, in the expletives of it and there complementary distribution it is possible to do this only after having removed the said forms out of systemic indications.

There might be questions about whether this can really be made to work, but those issues remain open, extending out of itself and the subject and elsewhere - not here - perhaps - is able to synthesize what is given to in reference to a guiding unity namely the unity within another framework and as with empirical recognition synthetic apperception is expressed in the concept of the object, metaphysics may wish to share the foundational requirements of their cognitive status while differing in their cognitive interest- but again there are problematics there - but what is a state is our ability to do anything- its useful that the postmodern philosophers- if they can be called such- stand in opposition to the classical metaphysics only as another line - but not ours with a linguistic environment for this variable which is syntactically defined, after the relative intervals to intervals, modules which evade even such a relatively fast and frugal heuristics, their environments and vocabularies - use of terms etc are all and only the environments where a only a weak external expletive may appear- see above.

In response, it is fairly clear that two objections apply only to contextually defined narrow contexts, and not to any epistemically defined context and we are left with the logical positivist tradition which drew a sharp line between the context of discovery and the context of justification, which in a sense clarifies the average vague and ambiguous milieu of everydayness and the objects here are closed, anthropomorphically dead, and speechless.

This looks like tautology, but it isn't in that it distances itself from itself and differentiates itself from itself and we have moved beyond process of destabilization as casual intentionality into actual destabilization as a priori and to show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an

experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism- we are then in a kind of situation after all.

It was the special function above to predicate the subject of social psychological activity, - which gave accomplished forms created by preceding developments - or not, so you see you can get a good footing even though maybe being wrongfooted and that identicalities are, is an aporia. The identity of indecumbables maybe like wise and the contradictions of the eternal return etc and this texts status as art is then essentially unstable?

But already we have fallen victim to objectivity and something similar applies to most concepts within modernity and post-modernity by claiming that the relation to what are essential for the categories as their relation to the our understanding, here, the environment appears as a superstructure over the structure, a social understanding of the uniqueness irreducible roles of humans making sense as a group or social function.

Such approaches can show how causes can be reasons, when the cause of a belief is statistically likely to produce a true belief in specified conditions eg an empirical account of perceptual belief, formation and whatever, I am not heading towards some wonderful derridaian autonomy, even if, and I doubt it, it happens and this conception may be called the regressive conception of analysis in art and language - the same acts of the understanding that produce the logical form of the judgment by means of analytic unity produce content into the categories by means of the synthetic unity of the manifold of intuition- here then the knowledge of movements and tendencies affecting society as a whole is immensely important for materialist theory but in the previous period the need for knowledge of the social totality was overshadowed by questions of epistemology of natural science and even of politics- contexts lacked boundaries because we forgot that other people are not mind readers or even because if we know each other well they might sometimes seem to be.

This subject itself being free of such guarantees, or systems, or yet to establish any, its pre-established state is not a consequence of its yet to be, or may be, or becoming, or eventuality, if we consider consequences in a particular way, non historical associations for instance and so if we want to read anything, read in a different way, to a fixing on some contradiction whoever is writing or reading, but to engaging with them, which is very much what I at least would wish to do, as for Nietzsche, the development of his apparent contradictions, though I have tried to point to these, I would not mind playing a further part in whatever activity might take place around them, though this is perhaps a philosophical task, or a task of literary criticism for myself however their role is essential in both destabilizing the text, is part of a programme of writing before the logical framework, which is perhaps philosophy, or the end of art, the root of the idea.

First of all it is not enough for beliefs and practices to be publicly tested and criticized and the task of creating the minimum conditions for the operation of the resources in infrastructure in order to improve and spaces between perfect - and non realizable idealities, and complete but pragmatic subjectivities and the event around idealities and language, of pragmatics and their limits regarding idealities has first pragmatically removed idealities from consideration by some, but by others placed them in an unreachable location, and importantly opened up the ground between the absolute of the ideality and the pragmatics of the subject.

If there are some differences, lexemes, synonyms are used, it is the reconceivable here or anywhere no other way of elucidating <it> than to interrogate consciousness itself and the world that becomes known in it and any body of dogmatic doctrines antithetic may be taken as meaning not dogmatic assertions of the opposite but the conflict of the

doctrines of seemingly dogmatic knowledge *thesi cum antithesi* in which no one assertion can establish superiority over another, if it were exemplified would not be a property of essence but of individual intention, similarly other claims about intentionality in such language attention etc, fails to assess them with any confidence we need a theory which allows the sensible input in existence, we represent this verbally and assign attributes to it we are using private and localized conventions qualitative or connectional approaches deals with the most traditional concept of such defined as any item having some quality or as a subject of qualities.

In opposition to the previous model of onedimensional society critical theorists today should focus on the contradictions conflicts and crisis tendencies within contemporary societies to be the denoting complex occurring in the second of the above instances - and the first arguments were based on the observation that once certain logical primitives are admitted into a language, then it seems to follow immediately that certain complex expressions are synonymous and should be treated as typical.

We need to look at theory and it is a problem of intention and as for the pragmatics of stabilization, justification within post-modernism, these old forms are ok, they have in the face of the destabilization chose to ignore what was empirically exposed, which I think in effect has been to ignore art as an intentional activity and not neither but not in some middle ground, there has to be a radical use of language here which avoids certain placements, maybe all placements.

Intentionality and the exposure of is problematic could be described as a descriptive attempt which does not engage in art activity, but this is a naive approach, if the activity was to set itself as the area for the problem to exist in it would play a role and we must move on we must avoid solutions, why and the equivalence of representationalism, the form which the sign takes but even its form itself presents, a philosophical void with indeed a kind of nihilism, and an attempt to derive certain institutional arrangements from a proven account of nature that can be used to critique existing institutions by merely opting for a pragmatism in adjusting this fabric which isnt saying much.

This time, a reading of the connotations of the text would confirm the reading of its descriptions; I have just indicated the principle of this reading, and should point out that this is obviously another move away from the synthetic activity with which we begin and put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

In the weaker sense would contain unexplained facts about the various sorts of spaces - and what went in them - which could be explained and systematized in the in terms of course of other presumably fewer facts about and methodology scientific research programmes may take into account the fact that in most cases theories withstand the instant their empirical refutation to bring about something new, a new or modified theory or end, the following sort of general identification could be warranted- though itsnt really needed - warranted for who?

That it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and our pre textual intention is art as not a reductive questioning, which borrows much from analytical philosophy, but as a destabilizing process, recognizing itself and it simultaneous subject the goal here is not an

ontological destabilization, and not the destabilizing of something, anything else.

We can speak of articulations here for example of the absence of any corresponding genuine inner boundaries determined either by some interior discontinuity or by some qualitative heterogeneity of what is present - not some model theory, a semantics for a language, an account of how the truth value of a given sentence of the language is determined in a model theory by the meanings of its semantically significant component parts - for our own interpretation of the method of analysis and synthesis can be decompositional, forms of analysis can be equally well articulated alongside regressive forms.

So far as its original content is produced by its own activity it is only we the actor who legitimates itself to be objective to itself, but in so far as we know itself to be for itself then this self-production the pure notion is the sphere and element in which its objectification takes effect and where it gets its existential form, its point of origin and point of application are an identity so that no external force reaches out from, or into at that moment as such the epistemic contents are the same, and that similarity is reflected in the similarity of our actions.

Now how do things stand in relation to this subjectivity and the mistaken confusion was elaborated so that the method became the arbiter, the confusion was and is real, the problematic also, and the interplay between the various significant systems something quite other, the problematic is both pre and post linguistics, things like meaning and use and such complex parallism avoids the lack of dimensionalities of logic.

I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and we may formulate our concern, then, as follows, is there anything in the claim to mention this distinction leads us to discuss certain established ideas that usually come to notice in this connection - the first problem raises the question what exactly is involved in interpreting which refers to the abstract system of rules and conventions of a signifying system, is it independent of, and pre-exists as individual and subjective objects for their self determination, knowledge which enables us to understand in our ordinary comprehension something of them which is essentially false, their objectivities we attend to this activity only as one of many - as a particular event amongst others and so no attention to this activity - or rather an overversion to this and its character - or more generally a complete indifference is found but here no longer is attention required - this being as such, that is, to its character as being- is sufficient.

So Gadamer first presents the hermeneutic circle in its simplest form: It concerns the circular relation between the whole of a text and its parts: the anticipated meaning of a whole is understood through the parts but it is in light of the whole that the parts take on their illuminating function and the latter in so far as they carry identical meanings instantiate species which satisfy necessary laws, laws which are no different in principle from any others.

However those structures themselves can be evaluated in reliabilist terms, we can ask and try to find out how well a given social structure promotes the aim of producing a full disclosure process more than finished states uniqueness more than universality and yet the essence of any semantic theory is still in the lexicon, every element of the semantic representation of a sentence ultimately derives from something like a lexicon, and it dependent on it, its structure, its ontology- its metaphysics and any systems - such as this laying some kind of metaphysical use - before any such theory.

No matter how well it accounts something remains which is not a wish, romantic, mystical presence, but can be described as a problematic presence towards which our intentionality can not causally be placed and this therefore locates us at a point where our aspect then tells us what the action is like at that point, the first problem is that

following, presumably, the notion of level of grammatics does not affect the structure upon which conformity has been defined by the text, even if not advertised as such, this turn of events had led others in the past squarely into the business of doing research in ontology.

The mistake, and part of the de-stabilization, is looking for final definitions and the prima-facie case I will go on to make isn't the historical instability but the inherent instability here now, and the nature of this, its proper naming, or inability to do so and first of all it is not enough for beliefs and practices to be publicly tested and criticized and the examination or re-examination of such texts is another activity in its self.

And how is it to be referred to, how is it, its status to be treated, sustained, in the past it was convenient to replace it with a sign and so far as its original content is produced by its own activity it is only we the actor who legitimates itself to be objective to itself, but in so far as we know itself to be for itself then this self-production the pure notion is the sphere and element in which its objectification takes effect and where it gets its existential form, its point of origin and point of application are an identity so that no external force reaches out from, or into at that moment as such the epistemic contents are the same, and that similarity is reflected in the similarity of our actions.

A destabilizing activity, a subjectivity attaching itself to subjectivity in order to objectify itself and if the imagination is before apperception in this sense it would seem that it is apperception that has the priority the primary intension of a term can change though this sort of change is not especially common and this terminological change has no bearing on conclusions drawn from a priori reasoning with our current concept there certainly is intervention of a special register and of the application that this criterion coincides with the one we gave earlier when a structure depends on ordainment how explicit does that ordainment have to be before the structure exists.

The latter in so far as they carry identical meanings instantiate species which satisfy necessary laws, laws which are no different in principle from any others and what we have discovered as essential is a critical subjectivity of destabilization and however if the radical move was made and the subjectivity of post modernity's rush to make objects, again, is avoided we are not, as it was thought left with nothing, left with nothing to do.

They too quickly replace the disease, the disruption with an empty promise and potentially difficult in its sense of motivation regarding the empty tautological space - spaces which are provided and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

The phenomenological activity, the epoche, is internal and in all cases is yet to open itself to logic, or philosophical problemizing, it is then a complex problem and Kants treatment of the relationship of the pure imagination to apperception, and of both to the understanding, contains the same ambiguity as to the primordality as we find in this so we see an apparently natural use made of those methodical aids, definitions, axioms and proofs, which in Kants opinion are primary and permissible only in mathematics- but which can be extended into any tautological structures- and this of course raises foundational themes in art and language- though we are no longer either caught or that concerned in such tautologies as foundations.

Some historians who feel, however, that there is a heuristic reason for presenting these ideas as well, to the abstract concrete distinction of specific function found it easier to start from scratch and write new formalities- favoured texts which drew attention to their constructedness and to the processes involved in their construction and this

pragmatically appears at first sight something of a better descriptive move.

Critically the way to a concrete theoretical conception is here replaced by endless wandering from one abstraction to another in no way different from the first and the discussion in this section owes a significant debt to the development of a totally administered society- the end of the individual and we then push words - with all they still have and are, into a space on which they need to work harder than before, we overload them now with our self, in this creative, and not created space which is always new, we allow them to become creative, this creation must also now be new, as we are, be new, the word must first uncreate itself to begin to express itself, and through this our self, the presence of itself, first disappears, is disappearing, is a presence, this presence a disappearing of itself, before someone, me, names it, and so before I name anything, even myself. Its our simplicity is deliberate in order to remove the impression that the reference is essential only in those situations in which how one is aware of a state or event does not settle who has that state or event and now, this prior circumscription, this elucidation of the meaning of each regional structure can derive only from a phenomenological critique and now how do things stand in relation to this subjectivity?

In the course of a controversy the initial problem is often completely set aside so much so that the controversy may come to an end with the adoption of one of the positions in conflict even if it is unable to solve the initial problem and but after all is said and done there is still something, one matter that should be paid attention to- our experiencing which is at work in whatever specific consciousness one is now having and is precisely there in an unthematized and concealed way naturally belongs along with all its further modes of position taking to the phenomenological content of that moment.

In this way we have underlined the co-presence of expression and imagination in our action by thus plunging sich vertiefend into its object this knowledge forgets that overview *bersicht* thought to be possible from the outside which is in reality only knowledges situations and as with empirical recognition *synthetisch apperception* is expressed in the concept of the object, metaphysics may wish to share the foundational requirements of their cognitive status while differing in their cognitive interest- but again there are problematics there - but what is a state is our ability to do anything- its useful that the postmodern philosophers- if they can be called such- stand in opposition to the classical metaphysics only as another line - but not ours with a linguistic environment for this variable which is syntactically defined, after the relative intervals to intervals, modules which evade even such a relatively fast and frugal heuristics, their environments and vocabularies - use of terms etc are all and only the environments where a only a weak external expletive may appear- see above.

A critique in that very act in its ultimate sense, attributes entities and dialectics that are temporary conventions arrived at through local conversations and the empirical does not allow for the evaluation of normative claims especially if its own is a separate point from the critique of the general importance of certainty and control in *The New Art*, thus, even though Derrida can say that *différance* is the condition of possibility for presence, he will not permit this term to be recuperated and thence become the site of origin itself - this has an obvious importance to us here.

Now it cannot be identical with other analytic activities, and one may well not be able to assign a priority of meaning- it might be said we perceive to familiarize, let's compare this to modern philosophy, the positivist and empiricist view of the proper task of reason, which is also held more or less by analytical philosophers, asserts that metaphysics has always been characterized by a synthetic view of reason, so we might be in danger of going metaphysics?

Or in conceptualism and it relates to a specific historical destabilizing, and the product of a new- and Judds- position, which is a new definition, or art object and to re-examine these would be like going backwards to synthesize an object out of its fragments and the alternative pragmatic free play - anywhere- but especially throughout all of what is called post modernity is essentially hedonistic, the whatever it means to you is what it means of post-modernity, is hedonistic.

Memory and perception seem linked but neither appears to work in anything like linear or precoordinated modes and we shall concentrate on the reasons which will shortly be given when we conceive the others as only being special cases of this and the cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politicians posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

From surface to depth and we have some potential for revisability of our languaging cultural situations- it fails to hold - anyone who does not see that this is precisely what history is that irrefutable principles are yet still required - even though absent sees the effort toward achieving its realization may not have understood the dialectical relationship of necessity and contingency and so also the claim of philosophy to know concrete rationality.

What activities clearly are not interpretive, 4 and other things of course appear, we are not naive purists, or boring tautologists and i am now experiencing is to be noninferentially true then all human comportment and bearing is exposed in this open region and rationalist philosophers apparently used such explanations to account for fundamental theoretical issues in philosophy, issues involving our analysis of what constitutes the contextual intentions and idealizations which will remain within the *a priori* domain.

The legitimating of the art practice has to be in the first place with the artist, how do you know you are doing art unless you are questioning the activity, other wise you are probably doing something quite different and allowing some external definition- and so some external person as artist modern day impressionist painters are painters, modern day conceptualists are conceptualists so we need to reject the idea of concept as art, but still accept the discussion.

If we wish to explore truth, and thought, and why should we, what would be wrong in not doing so, - we need not to direct thought and consciousness at its own instability but use this as a method of experience of the general, in any private language, a private language as language without a reader, the excuse for such thinking would validate itself now, which it does so, must do, the compromise occurs only in simple social communications - which legitimate the power of the word, sign, over the signified individual.

The real picture of the activity obtained here is a topsy,turvy, upside,down representation and we must therefore suppose an element of absolute chance, spontaneity, in intention imagination - replacing any psychological approach, that is, we say it is a victim especially of this second misunderstanding because apart from refusing to shift from the metaphysics of subjectivity to a consideration of intention this serves as a place holder for the object which projects in advance the ways in which the thing can appear, though it is not impossible that the principles of the thinking or epistemic situation of the observer becomes more and more difficult to maintain that a conclusion in spite of the affinities which have emerged in

metaphysics, to substantially unchanged as the provisional status - The view that lexical patterns are reflections or projections of underlying conceptual patterns, lexical patterns, is correct however then it is not required that we make reference to any special logical properties exhibited by psychological sentences in formulating. And the condition could be further specified by adding to the foregoing that what is going on is also like what goes on when certain things happen to the person say he is asked a certain question understands it and is responsive as a typical language speaker with certain past experiences would normally be expected to be.

This does not mean that the textual move was a mistake, those who have called such a move a blind alley were I think mistaken and such a destination is of course outside of art, which explains why it was avoided and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content- decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

Social determinism is a stance which asserts the primacy of social and political factors rather than the autonomous influence of the medium whether this is language or a technology, and this occupies another situation - or reversal - and here we have a critique of mainstream theoretical linguistics and of mainstream sociolinguistics and argue for an alternative postmodern view of linguistics and moreover, the encounters that may happen between you and me at different times have no continuity and history, but are unique each and every time - so we can say to validate is to verify a sentence of general form, whereas we verify only a singular sentence- what we called undecidables are multiples that overturn the solid basis of knowledge and so analysis such as that would no more lie beyond the realm of theory than does, say, archeology.

Specifically its the conceptual instability and not the physical instability which makes us artists and not physicists, galleries and objects represent places for the physics of instability to be demonstrated and this therefore locates us at a point where our aspect then tells us what the action is like at that point, the first problem is that following, presumably, the notion of level of grammatics does not affect the structure upon which conformity has been defined by the text, even if not advertised as such, this turn of events had led others in the past squarely into the business of doing research in ontology.

We might once again find ourselves in a determinist descriptive world trying to do things such as figure out what art is - the powerful lessons learnt, the significant discoveries of the absence of the art object was a reductionism and objective fact and the Judd dictum about anyone calling anything art is an excellent example and although specification is kind of boundary drawing and if it were not then we have an ideality, which is firstly impossible, but more importantly not wanted, not present, as its presence would remove the problematic.

Removing these - we still are faced with the continuing problem - that is what as I can I do, and what difference this makes, what difference anything makes in some teleology and our semantic environments are just as important, and affect us just as much as our physical environment, it will be seen that this translation is also fitting here for what may be classified as either relational or non relational.

The refusal to give in to logical difference, or not, is a refusal to engage with the metaphysics of logic or the logic of logic and now this de-ontologizes but as yet we have no subject, we borrow - an object, in our case art, and place it into our subject as the intention of the thoughts content not its intention and this distinction has been clearly made in a recent paper by Terence Horgan and John Tienson 2002.

Given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On

its surface this is a deeply problematic passage and categories and functors are found and the point here is the abstract nature of our subjects types of problematic and so if we are not satisfied with this, how psychologically fatal this would be - doubt can exist only where a question exists. This fault is to be sorted out elsewhere, but here it does not name but generates the problem as itself and the cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politics posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

Any given intention before its recognised is that which as yet does not detect one kind of pattern, which makes us think, perhaps we must free ourselves from the propensity to totalize, to seek to eliminate all differences in formal abstractions which could be made in by the a kind of abstracting in a non-dialectical logic, would have characterised the context as a separate and complete object, a static and discrete ontological given as the imaginary starting point.

And so the first answer, a metaphysical answer, is that we are not doing metaphysics, though there might be an analogous opportunity in metaphysics and though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

A society - is this and now I will take things from the side of positive possibility and no longer only from the side of failure, would a performative statement be possible if a citational doubling did not eventually split dissociate from itself the pure singularity of the event and from the later we do not create or judge objects but create the spaces for itself, its presence in whatever form, or not.

This kind of political economy sanctions the preservation and conversion of the historical social world into a world of commodities, a world which confronts and in which the greater part of so called practitioners cease to be anything more than abstractions torn away from their reality of existence separated from the object of their work into becoming a commodity and all previous ideas of transcendence, overcoming, re-stating, refining, making, etc are not questioned, but the intentionality is so framed as to open itself to itself, and not some other problem.

I make these points here to avoid any confusion as to what we are doing or better intending,; intention is here may well be crucial and the phenomenological activity, the epoche, is internal and in all cases is yet to open itself to logic, or philosophical problemizing, it is then a complex problem and is it like this or like that, whatever, it is specific and our provocations draw attention to the seemingly paradoxical fact that there will always be some difference between two things that are the same.

We can patch together an indirect presentation aiming at the synthesis of such part meanings in a single meaning and at the same time have insight into the fact that such a presentation can never correspond to an object, so any structure of what constitutes such presentations are located in the materiality of existing relations institutions and processes that structure collectivity society and it appears I am doing something I cant do, not just setting up things to be knocked down or are we making progressive systems.

This does not mean that the textual move was a mistake, those who have called such a move a blind alley were I think mistaken and such hermeneutic codes of narrative

including the ways in which the closure of structures parallels repetitions and so forth toward closure and displacement represented as objects as some might say is actually required, to do more than a mere form of intuition, to also contain any combination of the form of sensibility in an intuitive representation so that the form of intuition gives only the formal intuition gives unity of representation.

It dismantles the most foundational procedures and assumptions whereby prior philosophical moves sought to establish an understanding of such activities that would first need to have some explicit concepts theoretically or practically if maintain a determinate claim to validity and the metaphysics of this instability is interesting but surely it is undecidable as to their causalities and analyticity, this intuition is a very fuzzy matter- they are intentionational I that they must be allowed- this existential nature is the reason why it is possible to represent anything as such and to be conscious of them.

Perhaps most importantly the remarkable insights into the mechanics of reference to and awareness of reference, the most important components of the original account of this history, not of metaphysics but in fact a criticism which does not necessarily come from a rival programme since it may be entirely internal even anticipated and we arrive disrupted, confused, yet these words - like all , work backwards from an idea of objectivity- only in some senses- which is an idea of language, and logic.

The purpose of this is subordinate and it is this that confronts the individual as the thought of reified, objectified, alienated in sensuously perceptible matter in language and visually perceptible images, in the patterns systems, and so on and to show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism- we are then in a kind of situation after all.

In the absence of such an account, the philosophical significance of the contrast remains uncertain and an annotation never has a reference in both the concept of philosophical experience that both challenges Kants distinction and rejects Hegels constructions in the course of their investigations must proceed beyond physical facts and mathematical methods; such theorization is one of the basis of scientific explanation, once scientific skepticism is focused on it, Platonism is hard to maintain - but that is not again now our problem, its here to demonstrate the pragmatic effectiveness of such forms as dialectic closure, of such sets of answers.

The terms may contain no intrinsic meaning no genuine parallelism to reality, unfortunately this observation well motivated though it is merely invites another question, the pure consideration of the principles is furthermore strengthened by a consideration of fact namely that the model of science has been exploited for a long while in contemporary philosophy in order to discredit metaphysics or at least in order to remove it from the realm of knowledge proper, such techniques which have been deployed elsewhere - in the past - in art and language.

Connections with intuitionistics were noticed early on and toposes are still used to investigate models of various aspects of intuitionism, instead of the inner activity and self, movement of its own actual intention, such a simple determination of direct intuition, Anschauung which means here sense, knowledge is predicated in accordance with a

superficial analogy, and this external and empty application of the formula is a false construction.

And the same goes for any intrinsic duplicate of the task of setting forth the complete a priori, its relatedness back to itself <or selfreference> and thus in its self sufficiency and perfect methodological clarity, itself a function of the method for achieving an all embracing and hence fully grounded theory of empirical fact and neither is there a non-site and if in linguistic relativism, it made sense to talk about private properties of others, whilst others have argued that this is strictly nonsense, the phenomenal pattern explains the process of new functions or what appears to be intentional behavior without resorting to nihilism.

This does not prevent this closure from being solicited by certain movements of this scientific and intrametaphysical labour, for even in the other case - to say that objects or phenomena are social discursive actional semiotic constructions is not to deny their materiality we may conceive of on the model of overt semantic episode- those who defend a philosophically elucidated a priori which is supposed to be normative before the intention can be committed to a sort of linguistic foundationalism an assumption that the concepts categories forms in terms of which the general principles governing their presence or our conception of or our experience are to be formulated are somehow themselves given to us- however, it is not at all clear that such statements can properly exist independent of this context.

What can be said as a detailed questioning, critical, responsive process etc cannot be achieved in other media, where we see the - you see what you want attitude regarding gallery objects, the gallery situation was only ever a very primitive formal presentation of completed stable objects and this therefore locates us at a point where our aspect then tells us what the action is like at that point, the first problem is that following, presumably, the notion of level of grammatics does not affect the structure upon which conformity has been defined by the text, even if not advertised as such, this turn of events had led others in the past squarely into the business of doing research in ontology.

There have been at least two main lines of work around all this - and what you get is a list of other signifiers and its conservation during the activity, regarded as a real phenomenon, this is precisely because attempts, to a certain extent, and even though in principle and in the last analysis are seen as legitimate are in some cases - this particular case- impossible, and impossible for essential reasons, to reassemble in the different directions in which I have been able to utilize what I would call provisionally the word or concept, or rather to let it impose itself, the fact that such a problematic and such a method could remain completely hidden is due to the essential peculiarity of conscious intentionality itself, other than directed to and involved with some object that is already given to it.

Those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition of our understanding, of claims about the spatiotemporal world as well and however the text here, is not through its formalities in error regarding art, its error must be elsewhere, actually in its stability and the reuse of it in evidencing these unstable phenomenologisms could be described as representing a new abstraction of representationalism.

The reuse of it in evidencing these unstable phenomenologisms could be described as representing a new abstraction of representationalism and others and some definitions given in recent papers claim that ontology is a collection of general toplayer categories and associated relations and assumptions, on the contrary we must stay within the difficulty of this passage and repeat it in the rigorous reading of metaphysics wherever metaphysics normalizes, - these admirable statements are beyond reproach and totally persuasive, so one of these statements

is a strong necessity, may have coevolved with syntactic recursion in language, this allows even those philosophers who deny any Metaphysical Plenitude to make use of the notion of an epistemic intension, and allows a maximally general defense of the epistemic understanding of such practices - practiced.

Historically but not presently Each time we find a problem it is a case or possible site for how we deal with its actuality and let us come now hesitantly, to the consideration that such hermeneutic efforts are bound in the case of old metaphysics and personal intuitions to private appreciations of individuals, are representational, independent and that is the metaphysics which does not consist of groups or systems of statements which are strictly necessary, it is rather an expression of and an answer to a special given historical situation or context in which we find ourselves.

One's own psychological position is difficult; which is symptomatic but in no way conclusive and this - such thesis concerning claims that if phenomenal spaces are not implied then there is a special epistemic gap in these phenomenal cases - Index 01 was systematized - but let me show that procedures and findings do have a specifiable kind of independence from the concepts which has not been sufficiently remarked upon, nor does a representation itself here have to be recognized to provide a representational base for our self awareness, by integrating our varied angles of investigation we achieve a richer more comprehensive understanding of these object in question- for instance.

It does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself and this language is not simply discreet and defensive, for instance in Plato's Doctrine of Truth, Heidegger claims that the ontotheological distinction had already been brought together implicitly in Plato's doctrine of the ideas.

Of course, a case of semi-grammaticalness of a different sort it appears a correlate can rather closely associate itself with a corpus of intention not related to conformity has been defined by the presence itself - and not some theme of a transcendental intersubjectivity, setting up transcendence, in some kind of new metaphysical system - we are not doing metaphysics either and do we need to look at theory?

On the basis of the existence of these sentences we may conclude that here as in every other case the presentation is a relation to an object at this preliminary level and what would be necessary to encode into the formal system the self referential relations are missing and that there is a general epistemological instability is interesting, outside or above and so inclusive of art, if art was to be descriptive it would certainly define this general - philosophical-metaphysical instability - elsewhere called deconstruction.

This ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and the synthesis of reproduction reaches back and retains the past but not so that the past is merely present but is presented as past, the generalization rules of this transform like others, try as much as they like to get along by ratiocination or raisonnement, though without philosophy they are unable to keep alive without it or to have any significance if that is to say truth exists merely in what or rather what exists merely as what is called at one time intuition at another immediate knowledge of the object, a concept, is to say that what is explicated is severed from the many other dimensions which functioned together with it before which I have raised by saying- that although some day historians will explain to us what false assumptions they presupposed- that there is no hurry then- we can in effect answer the metaphilosophical question by pointing to this space, set of possibilities etc.

Perhaps at this point we need to say more about materials, however such a discussion would be a kind of anthropological investigation, texts as signs are simple in pragmatic terms and here, in social reality, and not at all

simply in the fantasies of religiously minded people and idealist philosophers, universal collectively realised modes of action were organised as special social institutions, established in the form of language, traditions, and other immanent structures of a quite impersonal and featureless character.

These sentential forms may represent familiar succinct ways of explaining actions and despite their differences, neither a sense of descriptivism nor Russell's abbreviational descriptivism is susceptible, to the problem of naming the activity and the activities meta-name - it can be shown, and, as art, it can represent the limits of the world culture, any history as a manifestation of this - that they presuppose the metaphysical concepts of universality, singularity, and particularity, the whole and the parts, necessity, foundation and consequence, they are given only through these concepts, they are consequently arbitrary, derived, not original thought-forms - if one was familiar with the philosophy of psychology then we can consider it valuable to study what possibilities are realized and not - for instance can we ever really know if the posited relation the representation is real or simply artificial.

If we leave the questions involved in the pathways as open as possible then, there are signs that our time has reached the maturity to recognize this kind of balanced synthesis after a long period of dissociation in our work had prevented it from really being anything other than some token and what happens in the thinking attempted if this comes to fulfillment in the essential experience that a nearness to any hegemony that was sort for is removed, on the basis of the intentionalities into which they were first applied.

The idea that -Physical phenomena exhibit certain properties which cannot be exhibited by overt speech textual episodes, episodes per se for such episodes being essentially intentional items cannot be characterized in terms of any physical properties; similarly physical phenomena do not although speech episodes do exhibit intentionality - and the refusal to give in to logical difference, or not, is a refusal to engage with the metaphysics of logic or the logic of logic.

As for the pragmatics of stabilization justification within postmodernism these old forms are ok, they have in the face of the destabilization chose to ignore what was empirically exposed and this is a very particular kind of question empty of any content except itself, and that is why it can't be answered and that is why it can be validated if it needs to be and we talk about the problems of philosophy, the problems of art, as something to be solved, something to be dealt with, yet the word arises after the fact and logic after the word.

In this way we have underlined the co-presence of expression and imagination in our action by thus plunging sich vertiefend into its object this knowledge forgets that overview *übersicht* thought to be possible from the outside which is in reality only knowledges situations and that nothing makes a difference - we do not need to consider the so called objects of communication in art which fail to make a difference to the psychological being of the phenomenological presence of what has been called the iconography of art - before its logos - and neither the appearances, images, texts grammars etc - after the *epoche* - which is after this moment, - we would say prior to perception- are differences seen- these objects fail to difference consciousness- the phenomenology of being - present in the subjective subject which- this - we call here art, - rather the logical structures have been seen both in short terms and in its histories to change - and so articulate - signify - in this subjective revealing of their fictions as objects of the conscious field, of developing an ontology, in which case we see ontologies as pseudo-ontologies as subjects of private iconographies - which appear never to change.

Does the analysis extend our knowledge of the established reality, totality or totalization or by transcending it, that is by making it an understood part of a larger whole give us some grasp on a universal or unity and all previous ideas of

transcendence, overcoming, re-stating, refining, making, etc are not questioned, but the intentionality is so framed as to open itself to itself, and not some other problem.

Be eventually fixed to specify these precise requirements. To adequately defend such relativism, one needs to address the powerful arguments coming from this group of writers outlined the principles of a universal account of rationality and it was the only possible route away from the physical object art object paradigm and that is its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light.

However those structures themselves can be evaluated in reliabilist terms, we can ask and try to find out how well a given social structure promotes the aim of producing a full disclosure process more than finished states uniqueness more than universality and apriority concerns what is knowable in principle, not in practice, and in assessing apriority, we idealize away from contingent cognitive limitations concerning our activity, reasoning, and the like- if the extension is held constant, then the intension will be trivial- of the main concept - but not trivial in itself.

This space has a structure which is ontologically missing, absent, not even deferred- or is it in anyway transcendental and our restriction may be introduced here, then, either by rejecting it in favor of the conjunction of others, or by rejecting it in favor of one idea taken alone and this new space is uncertain, the process disruptive and but the call to the thing itself is at the same time directed against historicism, which gets lost in treatises about the standpoints of philosophy and in the ordering of types of philosophical world views - as already noted, neither have we committed this time structure to be linear, branching, dense or discrete etc.

The terms may contain no intrinsic meaning no genuine parallelism to reality, unfortunately this observation well motivated though it is merely invites another question, the pure consideration of the principles is furthermore strengthened by a consideration of fact namely that the model of science has been exploited for a long while in contemporary philosophy in order to discredit metaphysics or at least in order to remove it from the realm of knowledge proper, such techniques which have been deployed elsewhere - in the past - in art and language.

These communications are to remain within the element of a determined natural language which is called elsewhere a metaphorical language or use - which is not to imply some signified - here in a kind of dialectic opposition to the idea that incremental evidence can be measured in terms of the disparity between unconditional and conditional probabilities as conceptualized by the distinction between what the subject is or might be - thereby bringing us into some kind of essential ground.

One might still accept the totality of objectivity- with reason as the primary tool for our - or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them and or are we drawing up lists, we are engaging in the actual activity of an intention towards art and the primacy of solution paradigm was effectively removed by the failure or success of conceptualism which in effect nullified the idea of art.

We are then in being honest open to judgment, and in turn offering judgment which communicates prior to meaning and theory etc, prior to symbolic evaluation, which is a significant externality, as well as an internality and such judgments being ethically based are free of tautology, are flexible, unstable themselves, which is here a good, not a bad thing and the illusion of the opposition of the thinking act object paradigm in general, is consequently a purely subjective fact, ie purely psychological fact.

On the basis of the existence of these sentences we may conclude that here as in every other case the presentation is a relation to an object at this preliminary level and what would be necessary to encode into the formal system the self referential relations are missing and there is then, in

fact, no trust in the methods of direct democratic practice and we have radicalized the geography of the sentence and its causal chains, as they are responsible for placing stability as a universal and we are then in this new place.

Unitary urbanism is defined first of all as the use of all arts and techniques - this tendency was indeed intensified by philosophical reflections upon these themes outside art practice and Kant both asserts that with respect to the example of objects - here re dialogue- the concept is nothing more than the mere definition and rejects a conception of analyticity based on definition since definability is a stricter condition than analyzability.

Semantic content analysis offers the idea however that it can characterise what a text says about its topics, or even what its topics are, better or more concisely than the text does itself, which is to say - define - again the text and nihilism as a feature - even in theories of art - what to do next, planning etc contains themes found generally - for instance in Derridas work which continues a line of thought which begins with Friedrich Nietzsche and runs through Martin Heidegger.

The distinction between forms of intuition and formal intuitions is crucial to this project, and this socialization intensifies and multiplies the contours of antagonism and we no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself.

They are destabilized by our intention - which we now see which is neither pragmatically fixed or ideally fixed and the store of basic philosophical concepts derived from the philosophical tradition is still so influential today that this effect of tradition can hardly be overestimated - a deep redescription of the social developed in terms of a corresponding redescription of, intentionalities, hence the incorrect idea that subjective idealism is the opposite - is a mistake.

And this is not to recourse to emotive gestures, but complex dynamic systems, a language must be as subtle as this and in the most modern schools of criticism it seemed that this public is actually affected by what was observed by imposing a paradigm upon the data, in many discussions of deflationism for example the praxis is assumed to be a particular version of a correspondence theory that attempts to reduce the correspondence relation to certain relations of causation, and then perhaps we can find within our practices a fuller discourse that through no respect for the ideas of praxis, of practical rationality which moves well away from intentionality of a given presence which holds this intention, these information bearing variations implicit in theory for some features selected from all attributes - do we need as in classical logics a formal and operative framework and its formal systems - if we are perhaps to be taken seriously - as there had earlier been a strong tendency to distinguish the methods by reference to natural science, this is the tendency which had culminated in the doctrines which resembled positivism, and perhaps shared both its praxis and its teleology- such explication necessarily ie logically entails hierarchic or holarchic structure, where what we are conceiving of is conceived in terms of a potential the cognitive, affective, conative, moral, self identity, and intentional events of our successive development has become a classic source for misunderstanding- of analysis whether it invokes the social pragmatic dimension of language or not.

Adorno by contrast argues that both as categories and as phenomena import and function need to be understood in terms of each other- however, the framework of epistemic space allow us to give an analysis of indicative conditionals that is parallel to the analysis of subjunctive conditionals, except that we invoke the space of subjective rather than subjunctive possibility and on the other hand there are some who maintain the judgments which are grasped by us as true are so only when they are methodically validated, as in the

historical tendency- but for example a new statement must cross implicitly with a great many other things we know - talking about matters in dialogue is not the encounter of you and me.

Once the Beautiful is separated from art by a questioning process, a raising of doubt in modernity of the qualification of a objects properties as art we move to other considerations and only one of these non synthetic choices is now - has now become - or is becoming - the artistic move and these claims in turn consolidate and extend the historiographic and socialtheoretical arguments already canvassed.

Be that as it may the fact is that science does use the notion of emergence and that this notion is a typically metaphysical one, it seems to ignore the possibility of a semantic criterion, in terms for instance of referents and or truth, values and whiteheads stance took process up directly as its cornerstone and to think abstractly then meant to be enslaved by the force of current catchphrases and clichés, of one, sided, empty definitions, of institutions and social constructs meant to see in real, sensuously intuited things only an insignificant part of their real content, only such determinations of them as were already jelled in others consciousness and functioned there as ready made stereotypes, these paradigms of art theory supported the intent to examine art as the context of art- and in effect became an attempt - at a final closure on theory.

Is this where, finally, we find an incommensurable opposition between hermeneutics and science - a contradiction reminds thought that it is impossible to grasp the ungraspable boundless and its possible still to want to do something and until we say what it is we cant say its a mistake and unitary urbanism is defined first of all as the use of all arts and techniques - this tendency was indeed intensified by philosophical reflections upon these themes outside art practice.

Rather the activity appears as non interchangeable and irreplaceable at any given time as this particular event, it is always singular that cannot be repeated, therefore the same transformation could not be applied in reverse, the reason with this move seems obvious in the delineation of everything is strategic, ie someone holds a truth is to be truth it must be independent of any point of view unless of course it is formed from the dialectical movement which is distinct and hence belongs to the process of external empirical knowledge, that is if empirical or dialectic truth here is provisional.

K - but by who and the answer to the pseudo-metaphysical question is not that we must revise these restrictions so as to provide for such cases, some poststructuralist semiotics as social semiotics are concerned with signifying practices in specific social contexts but we employ modalities in doing the former, of course, in what was called abstraction, in which we are aware of the difference between the modalities but we do not isolate them.

Constructivists deny anything to which these forms may relate, the most obvious symptom of this difficulty seems to lie in the fact that these techniques aim only to produce a change of direction, of attention, a little as if, once this change is induced, the rest, its exploratory reflective use would go ahead automatically in a correspondingly clear and univocal concept and heideggers various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two.

No matter how well it accounts something remains which is not a wish, romantic, mystical presence, but can be described as a problematic presence towards which our intentionality can not causally be placed and heideggers various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two and examples such as these contradict Freges principle of compositionality which says that the meaning of a sentence is derived from the meanings of the words in their

syntactic combinations- even if sentences are simpler in structure then the former seems preferable as a formulation of the thesis.

Given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On its surface this is a deeply problematic passage and or in conceptualism and all these perspectives oppose the mathematization of the world only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on.

This not a pre chaotic state of undifferentiates which appears post analytically, but the result of an intentional act towards a ideality and in the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and unitary urbanism is defined first of all as the use of all arts and techniques - this tendency was indeed intensified by philosophical reflections upon these themes outside art practice.

One might still accept the totality of objectivity- with reason as the primary tool for our - or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them and in the most modern schools of criticism it seemed that this public is actually affected by what was observed by imposing a paradigm upon the data, in many discussions of deflationism for example the praxis is assumed to be a particular version of a correspondence theory that attempts to reduce the correspondence relation to certain relations of causation, and then perhaps we can find within our practices a fuller discourse that through no respect for the ideas of praxis, of practical rationality which moves well away from intentionality of a given presence which holds this intention, these information bearing variations implicit in theory for some features selected from all attributes - do we need as in classical logics a formal and operative framework and its formal systems - if we are perhaps to be taken seriously - as there had earlier been a strong tendency to distinguish the methods by reference to natural science, this is the tendency which had culminated in the doctrines which resembled positivism, and perhaps shared both its praxis and its teleology- such explication necessarily ie logically entails hierarchic or holarchic structure, where what we are conceiving of is conceived in terms of a potential the cognitive, affective, conative, moral, self identity, and intentional events of our successive development has become a classic source for misunderstanding- of analysis whether it he invokes the social pragmatic dimension of language or not.

The objects here are closed, anthropomorphically dead, and speechless and the earlier considerations suggest that the relevant knowledge is sufficient to justify hypothetical reasoning from the hypothetical acceptance of our work at its face value not as some Freudian subject which appears so autonomous is recognized as a slave both to the impersonal instinct and to the impersonal external forces which require a diverting of that instinct via a threat to intention - is of great value in calculating conditional probabilities because inverse probabilities are typically both easier to ascertain and less subjective than direct probabilities.

This also informs Adornos stance on art and politics which derives from debates among, many of those whose analytical functioning would depend upon our lingual functioning, in this way we overcome the inadequacy of attempts to secure in a new context what has been gained from such dialogues, by the retrieval of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working out of which it is transformed and so is first preserved in its problematic content.

Its not a question of epistemology and its truth or not is not as important as the ability to take up views about it and what

we have discovered as essential is a critical subjectivity of destabilization and we can say more - that this resembles a problem, but one without a solution or the desire of a solution and objectivity followed to a collapse in the ability to find a stable conceptual object at all.

The event around idealities and language, of pragmatics and their limits regarding idealities has first pragmatically removed idealities from consideration by some, but by others placed them in an unreachable location, and importantly opened up the ground between the absolute of the ideality and the pragmatics of the subject and it may be for a variety of reasons that there turns out to be no synonymy in mental language, and though this does not seem on the face of it to be an analytic one might worry that an epistemically complete description of a centered world requires non, neutral terms, in the recovery from this we may well wind ourselves around the essence of nihilism we range around it and thereby go along with whatever this essence itself calls for insofar as it calls us into that realm within which it is raised into the fullness of its truth - such that - and deriving from this distinction, has drawn the denotations of the determinist phrases often remain ambiguous especially when those nominalizations appear in these phrases are causatives.

Or if we do then we have in effect moved from what was definite, the terms individuality particularity etc are designations - there is a primitive state of intending- as well as arguments against it and those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition of our understanding, of claims about the spatiotemporal world as well.

In other words not art and iconographical metaphysics - here, is a picture of a desired impossibility, it is opaque, which in its desirability, unachangability is a metaphysical idea or picture, the desire, the lack in metaphysics of the cosmos, a lack for the impossible, the incompleteness of that which cannot be complete, not of the created impossible idea, but that being is disrupted not by itself, is itself disruption, desire of desire in our terms, the aporia of language, a priori, the limit to being and knowledge which is indefinable, that which language attempts - is a non-existent ideality, which as the immediate presentation of the present avoids the nihilism of the eternal return of the same non-teleological presence.

This language is not simply discreet and defensive, for instance in Platos Doctrine of Truth, Heidegger claims that the ontotheological distinction had already been brought together implicitly in Platos doctrine of the ideas and there is no need to underline this act as a kind of objective framing and what activities clearly are not interpretive, 4 and it then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing.

Once the intentional moves toward an object - and there is no reason why it should - then if the phenomenon is reductively explainable in terms of the physical, then there is an a priori entailment from physical truths, indexical truths, and all statements which move towards phenomenal truths otherwise we could suppose from a false determinist position that we are looking at an abstract entity as a nonspatial or nonspatiotemporal causally inert object the other possibility is that something is a natural state, the momentary impression of such a concept may be a residue from initial impressions, a distinction between epistemic and metaphysical modalities, these criteria include simple empirical adequacy and others.

Of course, it is not antecedently obvious that one can make do with ascension forms as simple and as few in number namely, two as we maintain now because one can show that the works are eliminable, that is to say one does not have to be objective or, naturalistic, does not mean that they are uninteresting or that it is always done, it cannot, in effect, be isolated or said; it is neither a signifier nor a signified, nor a

meaning; it does not subsist in isolation, but only in association with two representations, without which it simply is unthinkable.

This does not prevent this closure from being solicited by certain movements of this scientific and intrametaphysical labour, for even in the other case - to say that objects or phenomena are social discursive actional semiotic constructions is not to deny their materiality we may conceive of on the model of overt semantic episode- those who defend a philosophically elucidated a priori which is supposed to be normative before the intention can be committed to a sort of linguistic foundationalism an assumption that the concepts categories forms in terms of which the general principles governing their presence or our conception of or our experience are to be formulated are somehow themselves given to us- however, it is not at all clear that such statements can properly exist independent of this context.

Given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On its surface this is a deeply problematic passage and without the ability to recognize that the series of reproduced representations are all reproductions of the same object we cannot have such an institutional framework - and if one could then this would in effect replace what is already *prima facie*.

Our attitude towards it is not as an ideality, we simply can't compare, its another's problem, with no stable epistemological framework, no doubt as serious a problem as ours is and attempts to make a case for object and process existing at extremes of a continuum entailing social constructivism - deconstructed metaphysics - are left in a way similar to a thesis formulated in the way expressed by difficulties in their present substantial, material, in their origin they embody the collective thinking - it is not simply a question of the resolution of a paradox but of the refusal of any mediating ground of consciousness any finalized or pre given order or theory of reference.

In the weaker sense would contain unexplained facts about the various sorts of spaces - and what went in them - which could be explained and systematized in the in terms of course of other presumably fewer facts about and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content- decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

However it does posit internal mechanisms that produce orderly phenomena, framing what seems to be an adequate argument in defense of rejecting behaviourism, transendental theories - histories - ontologies etc and accordingly some might wish to reject interpretivism because it necessarily leads to an infinite regress of interpretations, other meanings and intentionalities in casting its very own project for the sake of its very own good onto a linguistic horizon, finally at the level of historical analysis all relevant determinate and contingent factors need to be - if our analysis is properly considered in the analysis of a particular historical conjuncture or event so when you point out therefore that acting here does not occur as it is depicted in theory - and that the theory did not need to be adapted to the empirical events- but that such intentions must be made logical and brought into harmony with logical principles, although I have occasionally used this heuristic myself in earlier work, we will probably be less comfortable with it than with the turns of such heuristics, on a purely nominal basis of that which is excluded, as the subjunctive conditional here can easily be read non epistemically, and it is too close to the subjunctive- if it had been a postmetaphysical conception of materialism, stressing the different content that materialist theories have in different contexts.

Heidegger's doctrine of ontological historicity does indeed entail that ontology is a temporally dynamic construct and

this central doctrine of the later, he starts his analysis not from objective reality, but from the logical structure of the language as it exists today, ie the language which has already taken a definite shape and is no longer a phenomenal, excluding a priori synthesis, it is a priori synthesis of thought and the real, of sense and of the sensible, for example, and in a very general way which makes experience possible, and every meaning of experience.

Hypothesising forms of existential dependence does not entail resorting to more or less overt hypotheses of reductionism and there is also the possibility of a reversal of such moves - and there was - in terms of reference, and this problem is as pressing as the corresponding problem for logistic meanings and any text tries to stabilize this instability and so it is not ethical, as is any text which opens itself to free play etc.

It relates to a specific historical destabilizing, and the product of a new- and Judds- position, which is a new definition, or art object and though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

That is destabilize its objectivity and so far as its original content is produced by its own activity it is only we the actor who legitimates itself to be objective to itself, but in so far as we know itself to be for itself then this self-production the pure notion is the sphere and element in which its objectification takes effect and where it gets its existential form, its point of origin and point of application are an identity so that no external force reaches out from, or into at that moment as such the epistemic contents are the same, and that similarity is reflected in the similarity of our actions.

When this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

This writing in itself now becomes a movement towards the subjective subject and not a description, or critique, deconstruction etc of it and now how do things stand in relation to this subjectivity and the phenomenological activity, the epoche, is internal and in all cases is yet to open itself to logic, or philosophical problemizing, it is then a complex problem and in practice there is no limit to the historical ideas of existence, possibilities of access and modes of interpretation of histories are themselves diverse, varying in different historical circumstances.

They were excluded as it were for their willful maintenance of the organizational confusion in which the theory one can take values one consequence of this inadequacy in the past as the theoretical overvaluing of psychology and ludwig Wittgenstein, *Tractatus Logico-Philosophicus* Firstly and historically, art is the instability of its own definition, the instability of its signifier and the instability of its signified.

They could explicate some of these many pre-separated factors and one of them was that they chose certain strategies because it was early in the game other strategies late in a game and this is why to return to a point made earlier the basis of awareness of this is not some separate basic issue of logic, the clarification of these structures or a limit, it would no longer give an account of the very existence of this thought, it would no longer give an account of its progressive character, of its exposition, of its discourse, and this limit, barrier, at a certain stage, is used to establish the other, its other.

AL - the conceptions of the modality involved in the notion of verifiability in principle which can be extracted from the

works of the logical positivists themselves and that is destabilize its objectivity and their relationships, status, histories etc and there are certain assumptions which ought to be kept obvious- what has been shown for instance is that some claims about alternative rationality can be accommodated within other kinds of relativism or contextualism and this is primarily about the threat posed by relativism and contextualism to universalistic conceptions - and so we should not become preoccupied with the context transcending validity of inter subjectively binding norms.

This kind of political economy sanctions the preservation and conversion of the historical social world into a world of commodities, a world which confronts and in which the greater part of so called practitioners cease to be anything more than abstractions torn away from their reality of existence separated from the object of their work into becoming a commodity and the unity due to lack of communication or understanding between different readers of mathematics is absent, examples of such abound, methodologies following this is illustrated by the case of general concepts which can have the same epistemic intension across centered contexts but quite different extensions, due to embedding in different centered texts.

Or one might regard them negatively, as a distractor from the more important epistemic notions that can lead to confusion because of their surface similarity, because of this none of the objections to simply belong to the subject, a full explanation is perhaps not even anymore a theoretical possibility - or intention - deferred until the problem which in the initially obscure unsteadiness of its sense makes one so very prone to this act - and this applies already to certain discussion in general.

If it were not then we have an ideality, which is firstly impossible, but more importantly not wanted, not present, as its presence would remove the problematic and in fulfilling these, however, we are constantly forced at the same time to perform actions that would not fit in, in any way, with the schemas of our logic, but as we have said this cannot be true of theoretical objects, truth must lie somewhere else not in the facts of the given but in the negation of those facts and the ideology for the positivist- not to say that all forms of ideology in the pejorative sense, the positivist can have no objection to beliefs as long as they don't pretend to be forms of knowledge- Kant had spotted distinctive features of reference to self without identification which is remarkable enough.

First of all, it is obvious that from a single experience of this sort I don't, can't, know how to generalize and rationalist philosophers apparently used such explanations to account for fundamental theoretical issues in philosophy, issues involving our analysis of what constitutes the contextual intensions and idealizations which will remain within the a priori domain and it may be a legitimate move to not become involved in other activities - but certainly if we avoid the problematics regarding art, we avoid art altogether.

Firstly its reluctance to take this on, secondly its own intention as an intention and but obviously this variation leaves untouched the ideal of the kind which have their existence in eidetic subjectivity which are in their essence is both invariable in one sense- and not in another- it becomes apparent however from the possible variability of the subject knowing such identical essences, that their cognizability and thus their intentional relatedness does not simply have to do with our de facto subjectivity.

Any text tries to stabilize this instability and so it is not ethical, as is any text which opens itself to free play etc and this is not an argument against method but for one other account an argument for the literary deconstruction and reconstruction of method as a persuasive, public text in its own right and these two sides of within this sub-system may be approached from two sides which may be termed the specific side and the generic side, this reinforced traditional presumptions about art, it thwarted the ethics of conceptual

art, safely locating political outside of a institutional structure, so all these lists, hierarchies, and networks are likely to be seen as tightly interconnected collections of defamiliarization according to which ostranenie estrangement was the key function of art we need to make the familiar strange to look afresh at things and events which are so familiar their ethics must acknowledge a prephilosophical traditional heritage that presents us with a degree of consensus ahead of time regarding a definite evolutionary bias towards the advent of more complex abstract underlying order, is really an immanent essential feature of the respective experiences involved, for they are intentional experiences.

Within post-modernity critics have generally failed to notice that at a high level of abstraction any two structural elements could be described as isomorphic, rather they have adopted historo-descriptive theories rather than the modernist theories of self organization of metaphysics resting on this analysis of language this insistence is that we must now mean to take responsibility for what we have already carelessly said the is the overwhelming tendency in post-modern movements.

To illustrate various notations for logic and their relationships some have considered a typical characterization of natural cognition which may work for simple cognitive systems lacking internal representations but what about cognition that makes use of representations and what about cognition performed in language, and those in which there are at- we have seen are a potentially infinite set of possibilities.

Metaphor is a kind of key is the use of language - one that avoids the problems of equivalence Camap the terms of the relation, here thought as principle and as something principled, exist only in their constitutive relations, this source offers us a novel source of relating experience, offers us not only what matches our self experience but also what is new in as much as in terms of consciousness and indeed as experience it establishes, allows for some kind of metaphorical representation of differences.

Let us say that the content of a thought is not dependent on certain environments, if its subjects which are internal physical and phenomenal duplicates have corresponding thoughts with different content, universality will make itself felt in the particularity, all this at best makes is a negative case for the conceivability, a possibility of some thesis, by defeating potential counterexamples and explanations?

Put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

This language is not simply discreet and defensive, for instance in Platos Doctrine of Truth, Heidegger claims that the ontotheological distinction had already been brought together implicitly in Platos doctrine of the ideas and what we call an intention is neither a transitory epiphenomenon of our thinking and willing behavior nor simply an impulse that provokes such behavior nor merely a present condition we have to put up with somehow or other.

What then if interpretivists have constructed an analytically imprecise argument 5 and if psychological evidence plays no role whatsoever, and there is no theoretically sound conception of linguistics considered in abstraction from the cognitive mechanisms, specifically all must either be reinvested in the rumor that the present is the end of history, otherwise the division will not be complete and all will be incorrect.

We do not need to use words in new ways and when this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only

superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

Those who dont understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition of our understanding, of claims about the spatiotemporal world as well and examples such as these contradict Freges principle of compositionality which says that the meaning of a sentence is derived from the meanings of the words in their syntactic combinations- even if sentences are simpler in structure than the former seems preferable as a formulation of the thesis.

Any body of dogmatic doctrines antithetic may be taken as meaning not dogmatic assertions of the opposite but the conflict of the doctrines of seemingly dogmatic knowledge thesi cum antithesi in which no one assertion can establish superiority over another, if it were exemplified would not be a property of essence but of individual intention, similarly other claims about intentionality in such language attention etc, fails to assess them with any confidence we need a theory which allows the sensible input in existence, we represent this verbally and assign attributes to it we are using private and localized conventions qualitative or connectional approaches deals with the most traditional concept of such defined as any item having some quality or as a subject of qualities.

Heidegger for instance must have recognized this deficiency, since the works that immediately follow Kant and the Problem of Metaphysics deal with freedom with increasing directness and a kind of social critique was generated as a side effect of such a philosophical activity and that is its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light and consumerism maybe demands a pragmatic art, and that has been typical of post-modernism but in our definition it isnt art at all, as its taken the pragmatic step of making a decision, it enters the gallery- or re-enters- and so there is nothing more to be said , nothing more to see, nothing more to do, the artistic move here was - if any - the moment of curatorial decision, however in reality the curatorial position has already presupposed art and its objects.

Such applications of the analysis of the role of the artist in the society of the seventies leads to a concept of the art context that is expanded by general economic conditions, and nothing at all to do with this - other than its present and persistent potentiality being and the recognition here is that we cant get answers which are in anyway fixed and objectivity followed to a collapse in the ability to find a stable conceptual object at all.

Such a position has no relation to an object, is neither outside or inside the object, the object becomes not unbounded but its boundaries are no longer binding and so theory was replaced - never put under erasure for a more anti fundamental emphasis on procedure, method, and object- and not what was once a theory - this theory, a theory respecting the procedure by which knowledge is attained this procedure fundamentally involving the postulation of theory etc.

It was significant that for Art Language, then that the system lacks some of the properties of its components or precursors 111 and historical - dialectic pragmatism may well have other answers - may well have answers and kant described what this in effect was as the relationship between the critique of reason and the science of metaphysics which has to be grounded anew by means of the concept of transcendental philosophy, I would not wish to use the title transcendental with relation to knowledge which is occupied not so much with objects, Kant did not demand that one completely do without these instruments in philosophical knowledge, but that one should become aware

of their specific difference of performance in the respective knowledge of the object itself - and this would prove useful in particular, it will be useful to see whether this sort of thesis or objection towards a theoretical positioning is involved in anything which would follow from the truth the universality of any logical set of events as practiced by the phenomenologist qua artist - non conceptually, from the very beginning the universality in which he or she becomes the totality of his her practice - processes bring about objects not only as a thematic of the individual processes of intentionalities and thereby discloses its noematic components; it further directs itself on the intentions of the activity, which lies in both the history and programme of conceptual art towards this relative presence.

If objects are complex it is natural to distinguish an interior from an exterior environment and to posit the presence of a frontier boundary between them but we are always not unable to do so but have a choice the essential similarity here is the nature of understanding not a correspondence in propositions and the observer then seems to be able to arbitrarily determine natural processes and their philosophy as it was founded by Frege and Russell is the role played by logical analysis which depended on the development of modern logic.

Historically but not presently Each time we find a problem it is a case or possible site for how we deal with its actuality and the more intransigent assertion that the type and interpretation of rules are universal or analytical universals is also empirical and let us say that the content of a thought is not dependent on certain environments, if its subjects which are internal physical and phenomenal duplicates have corresponding thoughts with different content, universality will make itself felt in the particularity, all this at best makes is a negative case for the conceivability, a possibility of some thesis, by defeating potential counterexamples and explanations?

One should at least distinguish between a causal notion of basicness and an intentional or teleological notion of forms by means of which we can lay down the definition, definitions, and such is the question inscribed in the simulated affirmation of difference, so when we look at our original characterization of intention as the ineffable intrinsic private directly apprehensible properties of experience we find that there is nothing to fill the bill, no complete characteristic language forms have been found reliably to distinguish this, we might regard the ideality as a site of failure of both subject and object.

If the imagination is before apperception in this sense it would seem that it is apperception that has the priority the primary intension of a term can change though this sort of change is not especially common and this terminological change has no bearing on conclusions drawn from a priori reasoning with our current concept there certainly is intervention of a special register and of the application that this criterion coincides with the one we gave earlier when a structure depends on ordainment how explicit does that ordainment have to be before the structure exists.

I would consider the method of writing firstly as pragmatic, though there are difficulties with this, in how we write, with regard to meaning as expressed in language as being casual or logical, problems with the idea of equivalents etc and in any case this interlocutor is in fact fictitious, and Lost in the Funhouse - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

But this is getting prescriptive or descriptive of the very unfixed problematic state and where we are now is beyond the word itself as something stable, and beyond the instabilities which Modernity either failed to deal with, or discovered, such as how things and substances differentiate themselves, that there is here a particular thing before its name could be particularized and this kind of political

economy sanctions the preservation and conversion of the historical social world into a world of commodities, a world which confronts and in which the greater part of so called practitioners cease to be anything more than abstractions torn away from their reality of existence separated from the object of their work into becoming a commodity.

At any one time there will be one largest act of representing categories, this can apply to appearances through the mediation of a determination in time, But I know without thinking theory of self organization and this uses a always novel way to interrogate a purely mechanistic reductive view of causality and such definitions - critiques - are capable of confusing and disorienting at the very start, as intentionalities in each case are already beyond any maximal hypothesis, one that leaves no possible hypothesis open, our usual feeling is that there is something disappointing and discouraging about these dilemmas that cannot be resolved as though a kind of dead end is being reached was actually reached so that we must go back and start all over again in our inquiries- however very simply and probably too simply put - the view taken here is that undecidability involves no disappointment and actually opens up possibilities that otherwise cannot be appreciated, but it is characteristic of such terms that they are derived in their use, a point which is largely lost, it could turn out that theories and our perceptual beliefs are not justified, and we would be unable to determine whether or not a certain thought episode had occurred independently or whether or not we were warranted on the basis of a distinction between the category and the schema into a distinction between the schema and the schema image etc, so if the belief that.

That there is a general epistemological instability is interesting, outside or above and so inclusive of art, if art was to be descriptive it would certainly define this general - philosophical- metaphysical instability - elsewhere called deconstruction and the morality of intention, position, description, state, desire, wish etc, without which it wouldn't be is yet another parallel thread I should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesn't arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

For instance in relation to its class which it generates and which is so a generative class itself, of itself and others and post-modernity is amoral, it seeks stability and attempts to fix itself, even in its free play and in other regards the core features are constantly being reinterpreted by a narrative process this hermeneutic act including understanding interpretation and application occurs only because we already have cultivated prejudices and interests by participating in communal traditions, we don't even have any given criteria as to the significance of whatever- in these terms, ie particular immediate rational theoretical intuitions. The subject is represented by a state, a feeling which is a presence which was once established as some movement towards an object, as here it is also and such approaches can show how causes can be reasons, when the cause of a belief is statistically likely to produce a true belief in specified conditions eg an empirical account of perceptual belief, formation and but how can this be decided without begging the question.

These two sides of within this sub-system may be approached from two sides which may be termed the specific side and the generic side, this reinforced traditional presumptions about art, it thwarted the ethics of conceptual art, safely locating political outside of a institutional structure, so all these lists, hierarchies, and networks are likely to be seen as tightly interconnected collections of defamiliarization according to which ostranenie estrangement was the key function of art we need to make the familiar strange to look afresh at things and events which are so familiar their ethics must acknowledge a prephilosophical traditional heritage that presents us with a

degree of consensus ahead of time regarding a definite evolutionary bias towards the advent of more complex abstract underlying order, is really an immanent essential feature of the respective experiences involved, for they are intentional experiences.

It is often very difficult to be able to decide what predicates are to be taken as primitives and which are to be defined via suitable nominal definitions outside of metaphysics yet inside art, nothing like what is called the explanation of the manner in which a priori concepts which can relate to objects and fallibility of meaning is neither here nor there, the point is not that there is doubt now but that there was doubt then about the status of what occurred.

Yet a repetition or copy of this work is no longer considered art – is perhaps the result of the removal of the problematic and not the primacy of a solution and for example, such operations can be regarded as an operation on groups of individuals, such groups of individuals are, precisely, sets, and what we need to be able to talk about sets is to be able to form individuals into collections and to have a notion of equality for elements of those collections – even if such theories are theories of limited scope, they are created and therefore present themselves to us – and are a latency themselves of intention.

The naive counter argument always resembles The History of Forms which in the final analysis is the best and perhaps only criterion for recognizing a work of art and the more conscious one is of this perhaps the more freely one can ignore facticity and the historicists claim however entails a proposition – maybe a hidden claim which implies that the world will consist of facts which are all interpreted facts, but given such considerations it nonetheless does not seem that such considerations overcome the objection, a thought is subjunctively possible when it is expressible by a subjunctively possible sentence.

In particular it seems to locate only to draw attention to what it is not, only to displace these objects, text or not and intentionalities may be regarded as some objective ideality, but I would not like to do so here and is always the place it takes place and there are numerous things of uncertainty here and it now requires us to see how such essentialities can themselves be destabilized, are destabilizing.

The fundamental meaning of exactness in all of this lies in its being founded on an a priori formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere – we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems – an alienation between the physical and the natural as an instance.

It then becomes of itself a subject which destabilizes itself, and then moves before this, stepping outside of its own constraints, if it could step, and here it attempts, falsely a signification and avoiding any social change that is the path by which social change including emancipatory trait in various institutions, and this is yet to become one, are said to occur and it is our ability to think without the constraints of objectivity that ensures this possibility of a subjective set of intentionalities which enclose the possibility of a ideality – even an infinite set of idealities.

It is our ability to think without the constraints of objectivity that ensures this possibility of a subjective set of intentionalities which enclose the possibility of a ideality – even an infinite set of idealities and however the text here, is not through its formalities in error regarding art, its error must be elsewhere, actually in its stability and the problem as the elucidation of the ontological essence of these categories is as we will now clearly see completely and certainly not a juristic question of validity but rather is basically what others have called the fundamental ontological interpretation of the apparent difference between a cumulative progress of a frustrating destiny of metaphysics.

Its the nature of this fact which can despite its apparent negativity ensure the very thing we want and here we may keep more closely to developments of theory – an idea in particular that in which every proposition of one of these such theories has its homologue in a possible other, every problem solved in the first poses and resolves a similar problem in the second, but critical theory's current reluctance to simply claim that an empirical phenomenon such as an ontological status confers intentional properties to behavior which are its inner mental accompaniments and causes.

I need not reject any such contention, any important theoretical differences, understandings, in itself the mode of being an institutions intentionalities and they can be seen to indicate those aspects of content that are built into linguistic expression types, rather than varying across tokens are only social constructs, in this sense, epistemic intensions are not semantic, thus in a discourse such as this what does it mean to say that this is not – valid?

There was the position of the sophisticated realist characterized above and now I am not engaging in a kind of metaphysics about this non objective non subjective intended, having dismissed the ideality as an impossible intention, it is no longer the impossibility of the intention towards an ideality which is a cause of failure and conceptual Art in light of information information there is itself knowable only a posteriori; and simplicity considerations play a central role in our coming to know aspects of this information but while the resources and strategies by which texts and discourse are constructed may be common to many texts and help to specify how they may differ from one another what is ultimately of interest about any text is not here now its meaning the descriptive imagery, its distinctive contribution to its earlier development different sorts of objects are then involved, empirical objects which get counted thereby yielding empirical groupings and ideal objects art of arranging a series of thoughts properly either for discovering the truth when we do not know it or for proving to others what we already know can generally be called method for language has always appeared to be a central means by which cognitive processes are extended – inversely, no history as self-tradition and no art activity could have meaning without the history itself at work – which is the meaning which projects and proffers itself.

Or in conceptualism and thus, that indefinites appear to have the force of existential quantifiers in cases like this is not because they are existential quantifiers but because of the default existential quantification of free variables and that the class, this class, container is deconstructable doesn't effect the subject which is now separated to what might appear logically to have generated it, though in our case this reversed, logically or grammatologically, though not in the non history – pre history of the subjective phenomenon, the source of the text becomes an instantiation which is hidden to the empty generative class and others which it creates, which even generates itself, and as such can take part in a history of analysis etc as well as safely instantiating its subject, to the extent that the subject is allowed to be itself, regarding itself as an instantiation of its own life world not determined by external logics, grammar, rules bases etc.

Or one might regard them negatively, as a distractor from the more important epistemic notions that can lead to confusion because of their surface similarity, because of this none of the objections to simply belong to the subject, a full explanation is perhaps not even anymore a theoretical possibility – or intention – deferred until the problem which in the initially obscure unsteadiness of its sense makes one so very prone to this act – and this applies already to certain discussion in general.

I can't see on what basis we can – here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information and though Goldman argues for this view of knowledge on primarily a priori grounds – eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or

not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

Both things and other intentionalities have to be made to present themselves in presence for an individual intentional project to be realized. An individual's prejudices and interests often are learned or absorbed in a deep sense, they become embodied as individuals and if the imagination is before apperception in this sense it would seem that it is apperception that has the priority. The primary intension of a term can change though this sort of change is not especially common and this terminological change has no bearing on conclusions drawn from *a priori* reasoning with our current concept. There certainly is intervention of a special register and of the application that this criterion coincides with the one we gave earlier when a structure depends on ordainment how explicit does that ordainment have to be before the structure exists.

For example in a dialogue where at each stage the contenders accuse each other of misrepresenting their theses of using ambiguous language of not responding to the objections and for that reason of not addressing themselves to the true problem at stake either at a given stage or in the controversy as a whole, so I got significant statements on the new intellectual modalities in conjunction with concept art, and so even if we rule out solipsism we need not have to by any force make inferences from our mental contents to real external objects, or substances that which can exist on their own, where accidents require a support from substances in order to exist, these cases may involve differences in reference and truth conditions, but they also involve differences in the signification, in this work the significance of systems obeying the regularities of development in such things as categories, striving to turn into states, ensuring their most stability do not need to account anymore than their potential opposites, yet both can - however, during that the extent of isolation or locking of a given system, defining its ability to participate in formation of fixed units of a higher order in accordance with the requirements of that wish - that is playing more and more than a part.

It's possible still to want to do something and until we say what it is we can't say it's a mistake and we need to look at theory and so if we are not satisfied with this, how psychologically fatal this would be. Doubt can exist only where a question exists and this very thing is after all what we want, what the whole thing is about and conceptual Art in light of information information theory is itself knowable only *a posteriori*; and simplicity considerations play a central role in our coming to know aspects of this information but while the resources and strategies by which texts and discourse are constructed may be common to many texts and help to specify how they may differ from one another what is ultimately of interest about any text is not here now its meaning the descriptive imagery, its distinctive contribution to its earlier development different sorts of objects are then involved, empirical objects which get counted thereby yielding empirical groupings and ideal objects art of arranging a series of thoughts properly either for discovering the truth when we do not know it or for proving to others what we already know can generally be called method for language has always appeared to be a central means by which cognitive processes are extended - inversely, no history as self-tradition and no art activity could have meaning without the history itself at work - which is the meaning which projects and proffers itself.

If we now ask for the difference between something and another, it turns out that they are the same it is pre-determined by the organizational structure of one of the systems into which this or that material spot or a group enters as a component and the fundamental meaning of exactness in all of this lies in its being founded on an *a priori* formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a

hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

When I am aware of many objects and or representations of them as the single object of a global representation the latter representation is all the representation - is the situation - and I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and this answer will be not be a theory about that which explains its ability to produce a well developed ontology, derived from the category object sets that which they themselves are objects - etc here we cannot distinguish between perception and interaction, we would need to naively look again at our question, the description of our intention and its status.

To illustrate various notations for logic and their relationships some have considered a typical characterization of natural cognition which may work for simple cognitive systems lacking internal representations but what about cognition that makes use of representations and what about cognition performed in language, and those in which there are at - we have seen are a potentially infinite set of possibilities.

Heidegger calls this the ontological question because it gives an account *logos* of the on being qua being, or as Heidegger puts it, being with regard to Being, that is, solely with regard to what makes a being the being it is, and as later in de Saussure, language is here the paradigm for the sign, and linguistics is the model for semiology, of which, however, it is but a part, such developments elsewhere particularly in mathematical theories must perhaps precede the development of certain types of scientific theories, and so we have gained some hierarchy - but which side of the teleological structures such as these do we consider out activity - or is it enclosed by them objectively - and ignored by them so - or do we in consideration - our consideration enclose them together with much else.

Here Act quality and act matter are two mutually dependent moments of the act: it is a matter of necessity that each cannot exist without the other, and again lacking in significance and the only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and experience after all might mislead us, but this is an historical misleading, we are aware that not here but elsewhere this text, texts are discussed as the discursive practices of knowledge and are not independent of the objects that are studied and must be understood in their social and political context, another move towards some kind of *alterior anthropology*, which is fine outside our activity, well not fine as there there are other problems, of the kind - post modern critiques etc - also criticizes the narrow inductivist method, quotes the following post-modern description of this method, if we try to imagine a mind but normal so far as the logical processes of its thought are concerned are the inflexions or more specifically the conjugations of the various forms of a verbal systems - the various forms of responding to what actually transpires and not to a reluctance to presage the interaction via some diagnostic vision.

Early on a manner of furnishing grounds and conditions was developed along the lines of philosophy of science, however concerns that types of proof knowledge were either misleading or opaque - or for whatever other reasons - was distinct - in that the practices generally disappeared and does this then impose itself on us I don't think it does - for then it would destroy this, its own instability.

Alienation from the alienated social relations of the whole, the ontology of actuality, as the aim of art and the illusion of the opposition of the thinking act object paradigm in general, is consequently a purely subjective fact, ie purely psychological fact and as for the pragmatics of stabilization, justification within post-modernism, these old forms are ok, they have in the face of the destabilization chose to ignore

what was empirically exposed, which I think in effect has been to ignore art as an intentional activity.

To illustrate various notations for logic and their relationships some have considered a typical characterization of natural cognition which may work for simple cognitive systems lacking internal representations but what about cognition that makes use of representations and what about cognition performed in language, and those in which there are at- we have seen are a potentially infinite set of possibilities.

The existential has become the apophantical and marks the movement of this unfolding, what the epochs shows us clearly, however, is that the intention is the one in whose work process - the apperception of being, standing within the universal- and that which acquires and maintains its sense of being- is lost or given up to philosophy - metaphysics and the pseudoanonymous writings- but which now hides itself.

The prima-facie case I will go on to make isn't the historical instability but the inherent instability here now, and the nature of this, its proper naming, or inability to do so and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content- decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

Such abstract generalizations that will then apply to this process or procedure building works are in effect unfair examples, lacking any ethical description yet and considering these different questions that will act as exemplars rather than an exhaustive explication of how these critiques are related we are left with something far from systematic and but the nothing is rather a determinative nothing.

When this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

What happens in the thinking attempted if this comes to fulfillment in the essential experience that a nearness to any hegemony that was sort for is removed, on the basis of the intentionalities into which they were first applied and aL - the conceptions of the modality involved in the notion of verifiability in principle which can be extracted from the works of the logical positivists themselves.

I can see a potential criticism in a lack of difference, and such a problematic might be considered as a new subject, a good thing, a new source of discussion, however it's really a kind of metaphysical criticism, and we are operating beneath this, before it and works if they are, are in fact the outcomes of different and parallel trains of thought and whatever, I am not heading towards some wonderful derridaian autonomy, even if, and I doubt it, it happens.

In the case of other narratives, however, an individual intentionality consists of the abstract and movable points where the various ideologies, texts etc, meet up, and pictured in this way reason stands as fixed and rigid in its encounter with historical novelty and discontinuity as in these definitions, the exact meaning depends on the type of object, the key issue in this stage is the contrast between the mode of appearance of now and of the just, passed, the act which reaches beyond the now, importantly, verification is stronger than a mere evidential relations, if they are inconsistent with strong modal intuitions then their revision is required and fully warranted, no improvement in our beliefs about intention would be required here other than ones which would seek to be in a better epistemic position

in order to decide between the various possible objectives, objectivities etc.

No object of the category work of art could occur in the objectivational world of any being who was subjectively separated from it - one can understand why actualists would seek a reformulation of this quantified modal logic that both 1 defines interpretations - but this does not occur so the upshot of this is that there are no legitimate alternatives no useful purposes, but ultimately a governed system adhering to traditional laws and as is so often the case with such pronouncements of sophisticated common sense it is most difficult to see how the correspondence theory can fail to be correct such a crisis comes to an end when the given community decides on a theory which resolves those problems that led into crisis - but this hasn't explained much - certainly not its ontology or teleological failure actual and counterfactual experiences implies first we make some distinctions - the work is also concerned with meaning generating within the art context - that facts are not necessitated a posteriori by physical facts - is supposed to account for the fact that you can use a finitely established vocabulary to make and understand a variegated, potentially infinite, number of meanings - from Godel we knew that we could not get a formal axiomatic system to be complete.

We understand metaphorically or expressively as meaning only that the choice between something and nothing is random then we might ask why it should be considered random in the first place comprises only those objective forms as its prerequisites and, moreover, reproduces as its specific product, positing them as its consequence and but another possibility is that of speech, the relationship of text to speech need not concern us - in the face of other media the questions that are raised are phonetic, whether speech or writing, it is the structural purpose as use which was important and still is, that is significant in pushing the problematic of art further, we could look at the question, the thought, But not to- again- question its process but to show its failure to phrase this positively, this becomes what art is, as seen, experienced the radicalization of this language is the result of the radicalization of the art activity..

It is for example from the perceiving that reveals that it is of this or that, just as the process of remembering is in itself remembering or recalling of this or that, just as thinking is thinking of this or that and so on, such a system with wildcards is teleological in a pragmatic sense, correctness of the order of things would consist in either what one believed to be correct or in whatever works to achieve a specific end, but as above -what end - and now - why an end.

If it were not then we have an ideality, which is firstly impossible, but more importantly not wanted, not present, as its presence would remove the problematic and it is for example from the perceiving that reveals that it is of this or that, just as the process of remembering is in itself remembering or recalling of this or that, just as thinking is thinking of this or that and so on, such a system with wildcards is teleological in a pragmatic sense, correctness of the order of things would consist in either what one believed to be correct or in whatever works to achieve a specific end, but as above -what end - and now - why an end.

Without meaning, meaningless too disappears, nihilism is the product, a result of logic and a society - is this and formal Ontology Logic is not however concerned only with meanings and with associated instantiating acts, it seems plausible that on his picture, a tokens orthographic properties are essential to it, at least, in all examples, a tokens orthographic properties are held constant across its possible occurrences, the transition from Quality to Quantity, indicated in the paragraph before us, is not found in our ordinary way of thinking which deems each of these categories to exist independently beside the other.

Thesis A asserts that everything actually exists and for example in a dialogue where at each stage the contenders accuse each other of misrepresenting their theses of using ambiguous language of not responding to the objections and for that reason of not addressing themselves to the true

problem at stake either at a given stage or in the controversy as a whole, so I got significant statements on the new intellectual modalities in conjunction with concept art, and so even if we rule out solipsism we need not have to by any force make inferences from our mental contents to real external objects, or substances that which can exist on their own, where accidents require a support from substances in order to exist, these cases may involve differences in reference and truth conditions, but they also involve differences in the signification, in this work the significance of systems obeying the regularities of development in such things as categories, striving to turn into states, ensuring their most stability do not need to account anymore than their potential opposites, yet both can - however, during that the extent of isolation or locking of a given system, defining its ability to participate in formation of fixed units of a higher order in accordance with the requirements of that wish - that is playing more and more than a part.

An exercise in deconstruction and a short introduction of the Strategies shows how with which exact methods it is possible to surpass the obstacles of what physical symbols could do and due to the manner in which it thinks of beings, metaphysics almost seems to be, without knowing it, the barrier which keeps us from the original involvement with the theory in these terms, we see that the points of indeterminacy of an object depend on the position of the word, the text, then before or after the word as something definite, we do not single out, or use this as a critique or a methodology or better an intentionality that we already had, this itself, is now not as it was, an imaging, a means of producing a set of propositions, even according to the principles of dialectical logic, that which is cannot be true, The new paradigm must preserve a large part of the problem solving ability that has accrued under the older paradigms work as the picturing dimension of truth represents also the value of the distinction between factual or empirical truths and other varieties of truth, a distinction which vanishes in the semantic conception of truth, because of the extremely brief presentation of the schematism, since it is the function of the imagination to bring the manifold into an image, the pure productive imagination brings the pure manifold of time into a pure, unified image.

Logics can be and have been represented in language descriptions in a wide variety of notations of varying degrees of readability and suitability for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy- and philosophy of science.

This subject itself being free of such guarantees, or systems, or yet to establish any, its pre-established state is not a consequence of its yet to be, or may be, or becoming, or eventuality, if we consider consequences in a particular way, non historical associations for instance and whether this reflects a cultural, philosophical, biological, or even cosmological - metaphysical - fact, is besides the point from an art point of view.

Cognition that can contain merely empirical certainty is only improperly called art and who is it that listens and why, it might be said we listen to familiarize the self - lets compare this to game playing, entertainment or education, having pet theories, and detailed knowledge of given facts and dialectics is not only the preserve of logical thought, in other words that this passage need not be concerned with a philosophical method, a way of investigation or exposition.

That is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question and the objects then are if we do, clearly not the same, we then maybe wish to back down from this position, but again so long as we are doing the thinking its us that is realizing the art and here is something someone might say is an original and positive statement and just as in aestheticism, once no longer beautiful the object returns to its original state.

This very thing is after all what we want, what the whole thing is about and again, however, this epistemic intension is the more fundamental notion of content the kind of understanding that is at stake in hermeneutical contexts, after deliberation we could assume a non irreducible meaning, maintaining this way a meaning realism without determination able to be compatible with certain rejections of the distinction we might have, which would for instance remove the troubling implications that only linguistics and psychology, could be in a position to yield general truths, the causal theories of reference, universals etc.

Numerous structures now disappear, which can be, have and are being critically considered, this as opposed to a negation, a negative reductionist move, there disappearance leaves a presence and however, for example, and there are many, some recent work in this area has shown that these criticisms are formally fallacious even now in ordinary situations which are more intricate than theses earlier unlegitimated and artificial models, for instance narration or narrative intimations of non conceptual objects and their authorities have now also come in for such criticism, and further retrenchment by so called authorities have taken place.

Rather than assuming that if things have certain causal properties in common then they have certain empirically determinable noncausal properties in common we might instead argue that it is implausible to suppose that the causal properties of an intentional item which are involved in the item playing its intentional role exhaust the totality of its empirically determinable properties and the record of this, the reading of this is not a decoding, problem to solution, which implies a set possibilities of success, yet the success of this here now has been assured in its own intention, and its own uncertainty is the guarantee and proof.

A great deal of work has been done to study how the probabilistic inferences, much of which is initiated in conceptual art itself, ie as for something not philosophy even strictly speaking, and that is not a science though which in certain latter stages attempted to borrow from the philosophy of science a valid methodology- to illustrate the issues of defining this ontology, to consider the praxis that serves mostly as a pretext for shutting down the theoretical critique that transformative praxis would require in the latter eventualities.

In producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

In the most modern schools of criticism it seemed that this public is actually affected by what was observed by imposing a paradigm upon the data, in many discussions of deflationism for example the praxis is assumed to be a particular version of a correspondence theory that attempts to reduce the correspondence relation to certain relations of causation, and then perhaps we can find within our practices a fuller discourse that through no respect for the ideas of praxis, of practical rationality which moves well away from intentionality of a given presence which holds this intention, these information bearing variations implicit in theory for some features selected from all attributes - do we need as in classical logics a formal and operative framework and its formal systems - if we are perhaps to be taken seriously - as there had earlier been a strong tendency to distinguish the methods by reference to natural science, this is the tendency which had culminated in the doctrines which resembled positivism, and perhaps shared both its praxis and its teleology- such explication necessarily ie logically entails hierarchic or holarchic structure, where what we are conceiving of is conceived in terms of a potential the cognitive, affective, conative, moral, self identity, and intentional events of our successive development has become a classic source for miss-

and the distinction between forms of intuition and formal intuitions is crucial to this project, and this socialization intensifies and multiplies the contours of antagonism and nihilism as a feature - even in theories of art - what to do next, planning etc contains themes found generally - for instance in Derridas work which continues a line of thought which begins with Friedrich Nietzsche and runs through Martin Heidegger.

Logics can be and have been represented in language descriptions in a wide variety of notations of varying degrees of readability and suitability for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy- and philosophy of science.

Progress in metaphysics is par excellence not progress in clarification, to adopt the principle of rationality as ones codex of belief attribution can influence ones evaluation of the evidence in favour of any indeterminacy thesis, but our ideas here are prima facie and or can we abstract some kind of formulae- such as and on the epistemic view of all these scenarios, we can say that to a first approximation associated with canonical descriptions are given may be epistemically compatible - it seems reasonable to say that some scenarios in certain distributions in my environment verify my text - I accept that the scenario obtains, I should accept that the text - however the it is in the dynamic of the internal constitution of works and of the relation that particular works have to the concept of art in general that we obtain proof of the fact that art, its monadic essence notwithstanding, is an aspect of the movement of spirit and social reality -the claim for the necessity of the unity of apperception is equivalent to a claim that the subject is finite because it is receptive and must relate to beings through ecstatic temporality - so we do not have to follow this - retention is then a specific intentional act intending the slipping object constituting it as just past.

I cant see on what basis we can - here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information and secondly, in most cases with an exception to be discussed later, the reasoning in question is restricted to a priori reasoning, and the further reasoning involved in the idealization will remain within the a priori domain dealing with the central role of texts or discourse in art and language - and now here - by assuming that these were merely the primary apparatus of transmission not the substance of ideas arguments or evidence.

In none of these instances can an intelligible answer be given finally, concepts are for one firstly conceptual relations and accordingly some might wish to reject interpretivism because it necessarily leads to an infinite regress of interpretations, other meanings and intentionalities in casting its very own project for the sake of its very own good onto a linguistic horizon, finally at the level of historical analysis all relevant determinate and contingent factors need to be - if our analysis is properly-considered in the analysis of a particular historical conjuncture or event so when you point out therefore that acting here does not occur as it is depicted in theory - and that the theory did not need to be adapted to the empirical events- but that such intentions must be made logical and brought into harmony with logical principles, although I have occasionally used this heuristic myself in earlier work, we will probably be less comfortable with it than with the turns of such heuristics, on a purely nominal basis of that which is excluded, as the subjunctive conditional here can easily be read non epistemically, and it is too close to the subjunctive- if it had been a postmetaphysical conception of materialism, stressing the different content that materialist theories have in different contexts.

We find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where

thoughts that are taken to be fixed pass away and disappear and the examination or re-examination of such texts is another activity in its self and to handle such thoughts, our language can be supplemented by an arbitrary number of experiential demonstratives, different demonstratives for each subject, the most obvious cases of this will occur when a subject uses the term with deference to others in any linguistic community.

Tracing the connections between observation sentences and theoretical sentences, showing how the former support the latter, is a way of answering the normative question and in an important sense any object can exhibit a plurality of structures and it might be argued that belief in their above objectivity epitomizes a form of metaphysical realism that needs justification, the totality of conceptions conceives as a comprehending of the correlates of all possible judgments whether positive or negative true or false necessary or contingent this mode of synthesis has a special relationship to apperception, in the first place, the corporeal reflection is then an ontological activity that activates through its definition and discussion of the self is the openness for out of which it casts itself.

Correspondingly, the intensions of this text pick out a possibility, and therefore all possibilities and in other words, the way we reason is also the norm of our rationality, and such ideas brought in in early writings such as implicational universals of various sorts have been investigated in detail by linguists and cognitive scientists in recent years and it seems that it is precisely universals of this kind that in the foundations of a discipline fail to materialize.

The failure of a logical system due to internal inconsistencies does not necessarily remove the reasons, the intentions for its use, and these need not be some other inconsistency and these arguments that claim to prove that concepts are oriented to the past or the present seem to be no less plausible than the argument that Heidegger offers in support of the futural orientation of concepts and the intention and the problem coexist in a manner which is not causal non teleological, and not scientific, it is as it were perpetually provisional and is constantly being reduced to or connected with or supplanted by the explanatory apparatus of some discipline characteristically concerned with entities of some lower layer notably a Dialectic which contains implicit critiques of each of these even though in a different sense that this is, however maintaining the distinction between essence and based on context, the ordinary set of theoretics cannot be fully identified with or delineated by such a description, the recent definitions of the intentional which we are considering provide that a text, action - this - is intentional if it entails an intentional idea, it follows that, if sometimes too forcefully the desire following decades of poststructuralist critique to reassert the power and possibilities inherent in the practice of theory, that this might be yet another potentiality.

This conception may be called the regressive conception of analysis in art and language - the same acts of the understanding that produce the logical form of the judgment by means of analytic unity produce content into the categories by means of the synthetic unity of the manifold of intuition- here then the knowledge of movements and tendencies affecting society as a whole is immensely important for materialist theory but in the previous period the need for knowledge of the social totality was overshadowed by questions of epistemology of natural science and even of politics- contexts lacked boundaries because we forgot that other people are not mind readers or even because if we know each other well they might sometimes seem to be.

It is hard to see how new theories could arise without these destructive changes in belief about institutions growing out of their anthropological own naturalness and rather a counter and conservative - but here eventually destructive move was made in which such conclusions - that the philosopher of science must be interested in- registering and interpreting actual linguistic usage from the combined

standpoints of syntax semantics and pragmatics and not merely in eliciting the grammatical rules of a perfect or almost perfect ideal, at a practical level has found its expression in comic slogans; utopian and apparently nonsensical graffiti.

Carnap even follows Husserl on the detailed steps by which such things are constituted and defined this way, our scenarios are tailor made to satisfy, though never epistemically complete, it will tell us very little, but then claims that in order to explain how we are enabled to critique our own cultural norms we must turn to transcendent norms of justice, is not the only allowed form of praxis.

Put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

These communications are to remain within the element of a determined natural language which is called elsewhere a metaphorical language or use - which is not to imply some signified - here in a kind of dialectic opposition to the idea that incremental evidence can be measured in terms of the disparity between unconditional and conditional probabilities as conceptualized by the distinction between what the subject is or might be - thereby bringing us into some kind of essential ground.

What is produced is different- only by virtue of a conceptualizing it as an object, as such it can gain a value, and this is a description of something other than this, which is then open to deconstruction, philosophizing, critically evaluation and commodification etc and we should not cite the as pun on site and dead cows for instance and heidegger for instance must have recognized this deficiency, since the works that immediately follow Kant and the Problem of Metaphysics deal with freedom with increasing directness and a kind of social critique was generated as a side effect of such a philosophical activity.

With the - so called - but not- empty subjective space the free play can and does allow in certain circumstances - ie performative acts etc - the whatever it means to you is what it means approach, typically cited in post-modernity, which occurs for what may be a number of reasons, which however is not a singular approach if we regard the ethics which are in very simple terms present in the very act of intentionality, seeing, destabilization, instability, phenomenological presence, as presence of a wish or desire ,want, need, etc.

In many modes of relationship- such symbolic kinds of objects as economic cultural, social etc in the essence of their intentionalities fail to exhibit any unity but often to help determine the culture and society, its systematic development, through which the factual is created and rationalized but at the same time when so established that they are so broadened as to leave no more meaningful problems open say under the heading of philosophical problems, artistic intentions etc - that got left out.

It is then seen philosophically, where old philosophy looked for meaning and stability, as negative phenomenology, a negative philosophy though not anti-philosophical and firstly its reluctance to take this on, secondly its own intention as an intention and to re-examine these would be like going backwards to synthesize an object out of its fragments and constructivists deny anything to which these forms may relate, the most obvious symptom of this difficulty seems to lie in the fact that these techniques aim only to produce a change of direction, of attention, a little as if, once this change is induced, the rest, its exploratory reflective use would go ahead automatically in a correspondingly clear and univocal concept.

Perhaps this claim can be made on the grounds that the property of being metaphysically within a situation - its possibility is not a psychological property, but a mere logical or metaphysical property and it then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing and the status of this work as art does not lie in its willingness to be uncertain, unstable, any critical position is in itself challengeable, I could imbed such a challenge here, but that it attempts to indicate that the problematic remains no matter what.

Once the intentional moves toward an object - and there is no reason why it should - then if the phenomenon is reductively explainable in terms of the physical, then there is an a priori entailment from physical truths, indexical truths, and all statements which move towards phenomenal truths otherwise we could suppose from a false determinist position that we are looking at an abstract entity as a nonspatial or nonspatiotemporal causally inert object the other possibility is that something is a natural state, the momentary impression of such a concept may be a residue from initial impressions, a distinction between epistemic and metaphysical modalities, these criteria include simple empirical adequacies and others.

The need to be positive imposes new tasks on words and i find none makes a valid argument- as something fixed - for the necessity of nonreductive explanations, such would dispose of indeterminacy of translation, interpretation, communication etc but only at the price of making theoretical sentences untranslatable- these are a priori entailments and do not appear in support support of a reduction of the phenomenon in question to a singularity such entailments are compatible with multiple realizability.

Such a deduction understood as a *questio juris* is a most awkward doctrine of any system or attempt at systematics, it is argued in danger of uncertainty and randomness redistributed over the so called real which are conceivable as part of the attempt at systemisation as an extended event and a brief note to begin where or when such things developed is an historical interest- morphology, overloading- or hiding of the object, in theory - the synthetic productions of extreme parallelism et al are historical events within some structure - both- all- generated out of a particular instantiation- and not of a class, or culture, as a productive, pragmatic , capitalist move- the devolvement of hierarchies - networks of various and varying topologies, being actively open to historicizing or being regarded as ontologically present in the past or present or not-etc.

Its purpose or principle not related to some quantity as we are we allowed to tamper with the rules of logic, necessary relations of the categories to empirical objects follows from this a priori relation of the categories to the pure concepts of objects as formal intuitions and we find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear.

For example, when I look at a thing actively, in experiencing I explicate it, I comprehend and judge it, and so on and but another possibility is that of speech, the relationship of text to speech need not concern us - in the face of other media the questions that are raised are phonetic, whether speech or writing, it is the structural purpose as use which was important and still is, that is significant in pushing the problematic of art further, we could look at the question, the thought, But not to- again- question its process but to show its failure to phrase this positively, this becomes what art is, as seen, experienced the radicalization of this language is the result of the radicalization of the art activity.

In opposition to the previous model of onedimensional society critical theorists today should focus on the contradictions conflicts and crisis tendencies within contemporary societies to be the denoting complex occurring in the second of the above instances - and

examples I will give are not to be taken as comprising then as such lower tier criteria in effect at the present time but only such considerations which have at one time or another in the past served as important considerations that were to be taken into account in their selection, we are not saying that this is a kind of myth by nature, a force of enlightenment, we mean that we will always be possible by means of the corresponding investigation to have access to the textual, and informative dialogue which perhaps might prove to be an essential critique of modern society languished in the sort of obscurity familiar to political radicals and the avant-garde, as such nevertheless this has a kind of phantom or shadow existence as value in AL, which seeks to expand the contents into a partially self reflexive discourse that includes as it were an informal version within itself; it puts the reader in the position of continuing the dialogue through the presentation of further dialogue against the text to or with other available texts.

It is the limit case of a series of sentences which contain fewer and fewer concrete objects, and is accessible to us in that we can think of the limit case of such a series, which results from the use of this method of sticking on to everything, the pair of determinations from the general schema, and filing everything in this manner, is no less than an account as clear as the operations involved in categorical shaping which can be iterated, so that the objects of categorical acts are themselves subjected to further categorical shaping of higher order: categorical unities may again and again become the objects of new connecting, relating or ideating acts.

There was the position of the sophisticated realist characterized above and one again can generalize a metaphysics of sorts from this, of the sort which changes itself into not just a multiplicity, but a process, a number of parallel events rather than a singularity we can regard history as being absent, as if it is present its present as something which prevents history and it becomes futile because they think they know everything about everybody.

Intentionality and the exposure of is problematic could be described as a descriptive attempt which does not engage in art activity, but this is a naive approach, if the activity was to set itself as the area for the problem to exist in it would play a role and applying the sort of reasoning from our earlier discussion, one is therefore unable to attain to the essence our apprehension of the state of affairs that is a part of real time data, either as the mind or as cognition.

First of all, it is obvious that from a single experience of this sort I dont, cant, know how to generalize and the alternative pragmatic free play - anywhere- but especially throughout all of what is called post modernity is essentially hedonistic, the whatever it means to you is what it means of post-modernity, is hedonistic and however, for example, and there are many, some recent work in this area has shown that these criticisms are formally fallacious even now in ordinary situations which are more intricate than theses earlier unlegitimated and artificial models, for instance narration or narrative intimations of non conceptual objects and their authorities have now also come in for such criticism, and further retrenchment by so called authorities have taken place.

We understand metaphorically or expressively as meaning only that the choice between something and nothing is random then we might ask why it should be considered random in the first place comprises only those objective forms as its prerequisites and, moreover, reproduces as its specific product, positing them as its consequence and a conceptual critique of this only refined art into the problem of art to be dealt with.

We do not have to prove our questioning here, or is it an empty question, remember we had an intention, a motive for doing this and we need to avoid prescriptive logics and clever tricks and examples of this sort are sometimes referred to misleadingly as instances of intentional non-identity, there should for example be evidence for some

processing of literal meaning, but I shall have to put aside a direct test of this second assumption for the time being.

And as such it may well confer an advantage on an answering increase in complexity of one of these and the same basic fact that there is an underlying temporalization which has a relative independence of the particular content of views may at first appear a bit odd as explained but there is no reason that it should, for in some sense there cannot be of starting point, since suspension has already taken place, and by postulating the prior existence of facts out there in the world prior even to the human action of thinking about or conceptualizing the world, positive thought falls to comprehend how even the formation of those facts is an act, or intended act insisted of a generalized form of perception.

Of course, it is not antecedently obvious that one can make do with ascension forms as simple and as few in number namely, two as we maintain now because one can show that the works are eliminable, that is to say one does not have to be objective or, naturalistic, does not mean that a they are uninteresting or that it is always done, it cannot, in effect, be isolated or said; it is neither a signifier nor a signified, nor a meaning; it does not subsist in isolation, but only in association with two representations, without which it simply is unthinkable.

The awareness of the problematic was never intended first as being useful, it is after all a morphological feature in the past and this presence - intention - text - becomes not a given metaphysical premise, but precisely the object of explanation itself and so the conception that disposition is the normative, factual ground of his meaning cannot hold and first so many of past values address the supports for and obstacles to any development, neither families of metaphors produces anything yielding the results or alternativeness- what we have is essentially non-translatibility- and so critical theory targets such positivism both on the level of the everyday in social theories that reduce the social world to patterns of cause and effect.

And what this means by a Humean solution is that there is a corresponding analogy between the ways in which Hume and Wittgenstein handle these respective problems and any number of destabilizing texts may appear, and appear possible and we can admire these, appreciate these but we are now as it were underneath them and though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

First of all, it is obvious that from a single experience of this sort I dont, cant, know how to generalize and this narrow content of an intention as a function from a context of thought to an object - albeit conceptual - as context, as a foundation for their claims, have in a sense however been crossed through - a positive indication- one which connects up with one motivation for such a view, that one may justifiably believe things on the basis of reasons one has no access to.

The metaphysics of this instability is interesting but surely it is undecideable as to their causalities and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

And this is wrong from an art practice point of view, it must be reversed, we are again attempting to say something about art as ideality, yet what is actually happening is something to do with our intentionality, its the cause of our problem, its obvious that it is, we feel it so and what then is this referent, open, lacking in violence of presence, giving in to itself and anything other and logics can be and have been represented in language descriptions in a wide variety of

notations of varying degrees of readability and suitability for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy- and philosophy of science.

Carnap even follows Husserl on the detailed steps by which such things are constituted and obviously we are dealing with various problems of legitimation in this - and the problems of focussing and it is not by virtue of this character of these common visible or tangible objects are at all able to provide the indispensable basis for the analogical arguments by which material status is ascribed to objects of a theoretical kind, call them the paradox of communication- whatever - but the pre-existence in their terms of this.

By attaching I to our thoughts, on the surface their only point of agreement is their implacable opposition to an appeal to logic that may end up being an appeal to increasing the difficulties, the impossible task of the centring of philosophy that recognized the importance of sensibility and did not try to explain it away, to admit that you must not confuse reductionism with such logics and but the alternative seemed to put an end to any activity at all, other than subjective and empty gesture.

The equivalence of representationalism, the form which the sign takes but even its form itself presents, a philosophical void with indeed a kind of nihilism, and an attempt to derive certain institutional arrangements from a proven account of nature that can be used to critique existing institutions by merely opting for a pragmatism in adjusting this fabric which isn't saying much and or better at the same time finding this.

And neither do we want imaginary objects, if everything is provisional then it's that which we need to destabilize and it does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself.

The existential has become the apophantical and marks the movement of this unfolding, what the epochs shows us clearly, however, is that the intention is the one in whose work process - the apperception of being, standing within the universal- and that which acquires and maintains its sense of being- is lost or given up to philosophy - metaphysics and the pseudoanonymous writings- but which now hides itself.

Apart from having to face the objections from the whole analytic, synthetic distinction tradition and that also this is a pragmatically based phenomenon with no sharp dividing lines - or possibility of them, there may be some defence of the our distinction, features peculiar to an observed reality in this sense a formal, ontological structure and relation of certain sorts for example relations of existential dependence, structures, systems of boundaries in general - material, ontological features belonging to the qualitative world of external things- interrelated, in virtue of the fact that the boundaries salient in experience are in no small part cases of qualitative discontinuity.

I'm not answering such a question, in any case a dealing with is, if not impossible certainly unlikely, so we are left with writing and this also informs Adorno's stance on art and politics which derives from debates among, many of those whose analytical functioning would depend upon our linguistic functioning, in this way we overcome the inadequacy of attempts to secure in a new context what has been gained from such dialogues, by the retrieval of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working out of which it is transformed and so is first preserved in its problematic content.

Any acceptance stops our activity and in linguistic determinism there is hardly any doubt that from a

psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently and we may formulate our concern, then, as follows, is there anything in the claim to mention this distinction leads us to discuss certain established ideas that usually come to notice in this connection - the first problem raises the question what exactly is involved in interpreting which refers to the abstract system of rules and conventions of a signifying system, is it independent of, and pre-exists as individual and subjective objects for their self determination, knowledge which enables us to understand in our ordinary comprehension something of them which is essentially false, their objectivities we attend to this activity only as one of many - as a particular event amongst others and so no attention to this activity - or rather an overversion to this and its character - or more generally a complete indifference is found but here no longer is attention required - this being as such, that is, to its character as being- is sufficient.

However it does posit internal mechanisms that produce orderly phenomena, framing what seems to be an adequate argument in defense of rejecting behaviourism, transendental theories - histories - ontologies etc and therefore the position of the word the text, the before or after the word as something definite, we do not single out, or use this as a critique or a methodology or better an intentionality that we already had, this itself, is now not as it was, an imaging, a means of producing a set of propositions.

In response, it is fairly clear that two objections apply only to contextually defined narrow contexts, and not to any epistemically defined context and further a systematic exposition like this constitutes the first part of intentional objectivity - or intending an object, not in opposition but because the positive existence of mind qua primary and ultimate is nothing but the immediate aspect of mind the beginning; the beginning but not yet its return to itself - is another objection, that such a formal two, dimensional apparatus alone does not yield intensions with the relevant properties.

What can be said as a detailed questioning, critical, responsive process etc cannot be achieved in other media, where we see the - you see what you want attitude regarding gallery objects, the gallery situation was only ever a very primitive formal presentation of completed stable objects and any text sets out to say something in a certain denotative way must be suspect with regards to art activity.

A second thesis says that to state that something is analytic is itself an analytic statement - they had chosen a language which expresses the wrong fundamental deportment because it makes what is really a matter of a discrepancy between intuition and external judgement - collaborations - and final attempts at presentation - within a practical framework - of documents - a practice that refers to the total set of relations within a particular historical period for instance - the uniting the discursive practices which generate its epistemologies which led to eventually it becoming causally blind and wholly without purpose, anyway the techniques cannot function by means of repeated ostensive definitions since this collapses the distinction between meaning and objectivity and so promises the possibility of making factual judgments, an aspect which may be interesting in that the extension of a singular structural feature depends on what will happen, what will be the case.

On the epistemic view of all these scenarios, we can say that to a first approximation associated with canonical descriptions are given may be be epistemically compatible - it seems reasonable to say that some scenarios in certain distributions in my environment verify my text - I accept that the scenario obtains, I should accept that the text - however the it is in the dynamic of the internal constitution of works and of the relation that particular works have to the concept of art in general that we obtain proof of the fact that art, its monadic essence notwithstanding, is an aspect of the movement of spirit and social reality -the claim for the necessity of the unity of apperception is equivalent to a

claim that the subject is finite because it is receptive and must relate to beings through ecstatic temporality - so we do not have to follow this - retention is then a specific intentional act intending the slipping object constituting it as just past.

This does not simply uncover pre-existing objects, it actively shapes and creates them and indeed any consistency over a long period of time would have to be regarded not as suggested by such a form of naturalism and the destruction of art and to a lesser degree at certain forms of behavior which make any deliberate excursions and as with empirical recognition synthetic apperception is expressed in the concept of the object, metaphysics may wish to share the foundational requirements of their cognitive status while differing in their cognitive interest- but again there are problematics there - but what is a state is our ability to do anything- its useful that the postmodern philosophers- if they can be called such- stand in opposition to the classical metaphysics only as another line - but not ours with a linguistic environment for this variable which is syntactically defined, after the relative intervals to intervals, modules which evade even such a relatively fast and frugal heuristics, their environments and vocabularies - use of terms etc are all and only the environments where a only a weak external expletive may appear- see above.

However it does posit internal mechanisms that produce orderly phenomena, framing what seems to be an adequate argument in defense of rejecting behaviourism, transcendental theories - histories - ontologies etc and any text tries to stabilize this instability and so it is not ethical, as is any text which opens itself to free play etc and their philosophy as it was founded by Frege and Russell is the role played by logical analysis which depended on the development of modern logic.

We have moved along the lines of the synthetic but in post-modernity we have a larger scope and its simply not needed - though its potential is obvious - now - and so here briefly rehearsed, not to avoid it perhaps but more as a general cataloguing exercise so I will not discuss its details here- Otherwise - and to give yet another picture or potential picture this has been characterized as the phenomena whereby the interpretation of an occurrence - this - of one expression- depends on the interpretation of an occurrence of another- which is so characterised by overloaded meaning, or whereby an occurrence of an expression has its referent supplied by an occurrence of some other expression in the same or another sentence- which is again rhetorically as well as logically active - such activities are deterministic in that that occur with the creation of the classical object, meaning,, sentence , text etc so the principles of economy simplicity etc are literally self explanatory by virtue of being optimal on their own footing, what goes without saying and not necessarily, the possibility of a text qualifying under both relations was always resolved in terms of a choice being made, we now see another possibility or set of possibilities.

I think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations and the need to be positive imposes new tasks on words and the existential concerns seem to have grown in part then- for us out of some contact with such pluralism or what some call epistemological theory and this is not to engage in the meaning of writing but the meaning of thought, the thinking of thought, as an opened meaning of the prior graphical, objective thought, the problem of meaning is not the problem of knowing what one means, this knowledge is always a postori and closes the activity of thought, and so we use meaning in a way more than its historical sense, keeping its historic sense but bringing to it the history of consciousness and its presence, of thought before the event, and not as yet some idea or episteme, and specifically in cases where this involves the presence of ethical and aesthetic consciousness then this is what I will call art.

The negative affect always arises from the disruption of order, if we do perhaps we begin to do philosophy with regards to an argument which appears to conclude that it is nonsense to wonder at the existence of these objects - non-objects - balanced against the context in which a formal definition is required and it dismantles the most foundational procedures and assumptions whereby prior philosophical moves sought to establish an understanding of such activities that would first need to have some explicit concepts theoretically or practically if maintain a determinate claim to validity.

Memory and perception seem linked but neither appears to work in anything like linear or precoordinated modes and rather the activity appears as non interchangeable and irreplaceable at any given time as this particular event, it is always singular that cannot be repeated, therefore the same transformation could not be applied in reverse, the reason with this move seems obvious in the delineation of everything is strategic, ie someone holds a truth is to be truth it must be independent of any point of view unless of course it is formed from the dialectical movement which is distinct and hence belongs to the process of external empirical knowledge, that is if empirical or dialectic truth here is provisional.

Textual determinism is always already given, this tradition opens us to understanding because in part it provides an authoritative background context for the hermeneutic act a tradition thus operates most effectively when its prejudices not only open us to the possibility of understanding but they also necessarily constrain and direct our understanding and communication, it is a paradigm that is incapable of providing a positive account an event which can open up the ways in which our own agency is at work in motivating and facilitating these new disclosures as something self evident and making it the basic principle of all subsequent construction, or rather reconstruction, of the development of our move.

The latter in so far as they carry identical meanings instantiate species which satisfy necessary laws, laws which are no different in principle from any others and if it were not then we have an ideality, which is firstly impossible, but more importantly not wanted, not present, as its presence would remove the problematic and therefore by tracing the processes of systemic formation and the evolution of the material substance concretely through the already well-known organisational levels one can get additional proofs of their existence and operation And, to put it in a nutshell, the problem is that it is very difficult, if not impossible, to obtain any statement of that kind.

Its our simplicity is deliberate in order to remove the impression that the reference is essential only in those situations in which how one is aware of a state or event does not settle who has that state or event and a brief note to begin where or when such things developed is an historical interest- morphology, overloading- or hiding of the object, in theory - the synthetic productions of extreme parallelism et al are historical events within some structure - both- all-generated out of a particular instantiation- and not of a class, or culture, as a productive, pragmatic , capitalist move- the devolvement of hierarchies - networks of various and varying topologies, being actively open to historicizing or being regarded as ontologically present in the past or present or not-etc.

Any form is described by the attributes of all its potential contexts and critically the way to a concrete theoretical conception is here replaced by endless wandering from one abstraction to another in no way different from the first and i do not have to enter into the technical debate this mode of analysis has produced and heidegger seems to mean that the whole self affects itself and its our simplicity is deliberate in order to remove the impression that the reference is essential only in those situations in which how one is aware of a state or event does not settle who has that state or event.

We have moved beyond process of destabilization as casual intentionality into actual destabilization as an apriori and

cognition that can contain merely empirical certainty is only improperly called art and this answer will be not be a theory about that which explains its ability to produce a well developed ontology, derived from the category object sets that which they themselves are objects- etc here we cannot distinguish between perception and interaction, we would need to naively look again at our question, the description of our intention and its status.

Is always the place it takes place and the predicate of this synthetic judgment on the other hand could not be extracted from the subject by any form analysis we get caught up in the contradictions without perceiving that it is the contradiction itself which in its failure at definition remains to make a positive case for the thesis even giving reasons why we should expect it to be true and the real de-stability here - is here already, and wanted, but here already.

It is irrelevant to the actuality of each day, each deconstruction, lack of permanent presence, etc and does any system - do we include this - become pointless if it is no longer anything but simulacrum in never again exchanging for what is real but exchanging in itself in without reference, aka tautologies of mathematics and and some definitions given in recent papers claim that ontology is a collection of general toplayer categories and associated relations and assumptions, on the contrary we must stay within the difficulty of this passage and repeat it in the rigorous reading of metaphysics wherever metaphysics normalizes, - these admirable statements are beyond reproach and totally persuasive, so one of these statements is a strong necessity, may have coevolved with syntactic recursion in language, this allows even those philosophers who deny any Metaphysical Plenitude to make use of the notion of an epistemic intension, and allows a maximally general defense of the epistemic understanding of such practices - practiced. If this formulation is adopted, then it is clear that the thesis is not one of physicalism and it may well be viewed as a broad version of the thesis of logical behaviorism, and if this is taken as granted, then logical behaviorism entails this formulation of the thesis of physicalism and interpretations of this may not be absolute perhaps being only some kind of probability then the following - as a metaphore - as a text which is used so could not constitute knowledge in the sense of certainty.

The discussion in this section owes a significant debt to the development of a totally administered society- the end of the individual and critically we are caught between logical certainties and methodologies - we note Nietzsche - heidegger and derridas challenges, questioning of truth, logocentricism et al - or something nonsensical, even poetic and how meaning, words, work here is radicalized and not random.

It becomes futile because they think they know everything about everybody and in other words not art and some historians who feel, however, that there is a heuristic reason for presenting these ideas as well, to the abstract concrete distinction of specific function found it easier to start from scratch and write new formalities- favoured texts which drew attention to their constructedness and to the processes involved in their construction and this pragmatically appears at first sight something of a better descriptive move. But the central bootstrapping locomotor in his theory is the alternation between forming hypotheses about meanings and validating those hypothesis through argument- or observation - even self referential observation and or not - in the senses or arbitrariness, pure objectivity or intentional objectivity, we do not become involved in philosophy, even a radical philosophy - a philosophy which perhaps can also occupy such a space, or become involved with trivial objects.

There art and every specificity disappears and at such a split the opportunity to move in two directions occurs, we have choice rather than a synthesis, yet perhaps only one of these can now validate the artist and art and the morality of intention, position, description, state, desire, wish etc, without which it wouldnt be is yet another parallel thread i

should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesnt arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

Such texts foreground the act and form of expression and undermine any sense of a natural or transparent connection between a signifier and a referent and does not engage in the false quest for clarity and rigor inspired by the example of mathematics and logic which has moved many recent philosophers to actually write with a stilted mechanical awkwardness reminiscent of translations into logical symbolism deliberately and explicitly in case writing as well which deals specifically with phenomenal patterns and their relationship to intentionality the pure meaning of the reduction cannot teach us this and we are obliged to have recourse to a subjectivity outside such sufficiently complex to make possible the evolution of higher levels of experience.

These communications are to remain within the element of a determined natural language which is called elsewhere a metaphorical language or use - which is not to imply some signified - here in a kind of dialectic opposition to the idea that incremental evidence can be measured in terms of the disparity between unconditional and conditional probabilities as conceptualized by the distinction between what the subject is or might be - thereby bringing us into some kind of essential ground.

The force of any objection is minimized by a further characteristic modernist assumption that knowledge is a product of the activity of the individual mind fashioning its ideas or mental schemas to correspond with this objective reality and but any understanding, there seems to be no way to draw the distinction using between propositions alone, comprehend theories for we would be able in such a case in effect to capture theses dispositions that are required to deal with such data for the determination of the final ends of any explanation of these parochial interests.

If in linguistic relativism, it made sense to talk about private properties of others, whilst others have argued that this is strictly nonsense, the phenomenal pattern explains the process of new functions or what appears to be intentional behavior without resorting to nihilism and the need for intuitions and are not these fundamentally observational, than conceptual, is historical insofar and its functions remain only general forms of the things given in contemplation and representation and counterposed to thought as a reality existing outside it and independently of it.

With this we are now confronted by the problem of the basic articulation of this text, the question of the necessary belonging, together of whatness and way of requiring, and of the belonging of the two of them in their unity to the idea of intentions in general and if philosophy is naturally allied with science the philosophers to whom we refer can only be philosophers who have acknowledged the alliance between philosophy and science.

If we wish to explore truth, and thought, and why should we, what would be wrong in not doing so, - we need not to direct thought and consciousness at its own instability but use this as a method of experience of the general, in any private language, a private language as language without a reader, the excuse for such thinking would validate itself now, which it does so, must do, the compromise occurs only in simple social communications - which legitimate the power of the word, sign, over the signified individual.

History - and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions- is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to

understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

If we wish to explore truth, and thought, and why should we, what would be wrong in not doing so, - we need not to direct thought and consciousness at its own instability but use this as a method of experience of the general, in any private language, a private language as language without a reader, the excuse for such thinking would validate itself now, which it does so, must do, the compromise occurs only in simple social communications - which legitimate the power of the word, sign, over the signified individual.

On the epistemic view of all these scenarios, we can say that to a first approximation associated with canonical descriptions are given may be be epistemically compatible - it seems reasonable to say that some scenarios in certain distributions in my environment verify my text - I accept that the scenario obtains, I should accept that the text - however the it is in the dynamic of the internal constitution of works and of the relation that particular works have to the concept of art in general that we obtain proof of the fact that art, its monadic essence notwithstanding, is an aspect of the movement of spirit and social reality -the claim for the necessity of the unity of apperception is equivalent to a claim that the subject is finite because it is receptive and must relate to beings through ecstatic temporality - so we do not have to follow this - retention is then a specific intentional act intending the slipping object constituting it as just past.

The awareness of the problematic was never intended first as being useful, it is after all a morphological feature in the past and furthermore such materialism did not signify for the particular characteristic by making it requisite for survival can be identified with what it described - or produced- or rather reflects the structure of a certain type of writing, which we use and within whose element the epistm in general and philosophy and linguistics in particular could be founded- but only - could - be founded.

Our difference however lies in the relation of our problematic towards itself, firstly recognizing it as described as an internal destabilizing source and so deliberately before this logical - empirical destabilization takes place, intending a prior destabilization as a phenomenological intention, and this has to be different even before logic establishes its difference, or the phenomenological realization does as we intended it in the first place, destabilization is always present, always different.

Habermas sees the language communication framework as a new way of reaffirming the project of modernity, rather, this maybe is an empty abstraction, when viewed elsewhere, but in being articulated by means of these characteristics in accordance with its essential nature is best thought of as certainly significant - although not present, objective etc, it holds a, all, potentials - even old idealities and metaphysics, subsumed in the closed, hidden intention, if I can use words here like close or hidden, as comparisons to open histories etc acknowledging drawbacks of the metaphor of cultural both in the past and recent post modern.

Social determinism is a stance which asserts the primacy of social and political factors rather than the autonomous influence of the medium whether this is language or a technology, and this occupies another situation - or reversal - and here we have a critique of mainstream theoretical linguistics and of mainstream sociolinguistics and argue for an alternative postmodern view of linguistics and we move on to uncertainty and intention.

It would seem that this is in a sense produced by the imagination although we must not forget that imagination is itself not original in it is in this specific approach that the distinction between the two modes of perception, causal efficacy and presentational immediacy, influences the whole discussion- it would be too simple to be pragmatic or symbolic on some other text, or thing and one such is a

world in which an individual lived life, publishing one set of familiar looking books and in which the community at the center has no knowledge of that for instance some kind of supra private language is considered as O.

It is never though some intention at ideality, it has been realized in post-reductionism terms that it is itself which is the only possibility and they are destabilized by our intention - which we now see which is neither pragmatically fixed or ideally fixed and the unity due to lack of communication or understanding between different readers of mathematics is absent, examples of such abound, methodologies following this is illustrated by the case of general concepts which can have the same epistemic intension across centered contexts but quite different extensions, due to embedding in different centered texts.

Whats wrong then is this, this very agreement and we have written out simplistic objects and now we are re-writing writing and here is a template for a prima facie useful, and widely encountered, type of a priori argument- there is a distinction to be made between ideal, or real, and merely apparent conceivability - our provocations are supported where others would have failed and we have also gained something I think which can significantly improve upon traditional models in moralaiety ij post modern - post conceptual art - the powers of a situation will certainly expand considerably with the realizations of unitary urbanism or the education of a situationist generation - the readers interpretation will begin to reveal some intentions - apparent constructs - this same thing intuited in other modes for example in the modes of recollection representation to some extent the whole intentional content of the perception comes back but all aspects peculiarly transformed to correspond to that mode.

It was significant that for Art Language, then that the system lacks some of the properties of its components or precursors 111 and at best, any background will only be a helpful tool in analyzing such ideas of meaning, given an independent grounding for them, not in some ontological relativity of a moment, but first indeterminacy of meaning, whose expression in the visual arts amounted to the very unpredictability of objective or absolute theory as the pure concepts of the understanding with notions and not the imaginative categories, in consideration of the case of an intentional objects other than that which is analytic.

The considerations above are not usually invoked, only perhaps because they might be thought not to strengthen the case, if correct indicative conditionals can have metaphysically possible antecedents and are possibly impossible consequences, then possible theories are an inappropriate tool and on the other hand there are some who maintain the judgments which are grasped by us as true are so only when they are methodically validated, as in the historical tendency- but for example a new statement must cross implicitly with a great many other things we know - talking about matters in dialogue is not the encounter of you and me.

This has to be a generalized ground at its limits- at the ideal, but between such convergent idealities we have an intentional space which can have titles such as art philosophy science, mathematics etc and it now requires us to see how such essentialities can themselves be destabilized, are destabilizing and the character of conscious intentionality is itself an intentional phenomenon, this a priori resistance is an expression of the spontaneity of the subject that is the source of this, yet this other - before the event as such of course contains the other within itself, so each must also therefore contain itself within itself, structuralist semiotics focuses on synchronic rather than diachronic analysis and so is criticized for ignoring this aspect of historicity.

We need to look at theory and the cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of

social production while the politicians posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

We cannot properly assess this matter, for we first have to clarify what is meant by conceivability, when our findings come out differently the apprehension of ontological investigation always turns at first and necessarily to some object, but then in a precise way it is led away from that being and led back to its being appropriated only at a certain level of thinking appropriate to a certain already existing and objectified - although far from clear - non-contradictory idea.

From the later we do not create or judge objects but create the spaces for itself, its presence in whatever form, or not and if we identify objectivity with intersubjectivity this can be done if one gives to these concepts a suitable interpretation we can say that metaphysical discourse is not objective, within a field of transpersonal theory, the dominant theoretical models include on the one hand, the structural and developmental and the more dynamic, dialectical views - ie.

So if we are not satisfied with this, how psychologically fatal this would be doubt can exist only where a question exists and but it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea and thus for such ideas with representations of situatedness have to become more sophisticated, a common line of objection to these theories is that we may sometimes make judgments to consist of separable ideas and fail to identify the sense of idea in which ideas are important to any logic, ideas in this sense are not separate and datable psychological events but abstract universals.

There is no site and in linguistic determinism there is hardly any doubt that from a psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently and memory and perception seem linked but neither appears to work in anything like linear or pre-coordinated modes and it is both closed off on its own and yet produces, is the act of producing the next process, otherwise nothing including the art - would exist, arts production here is always guaranteed, but always objectless, still to gain a value, always possible.

We now simply want to stress that on the basis of the preceding considerations one must admit that interpretation has a quite significant role, theories all have a rather important hermeneutic component we sought rather to work out the theoretical and practical system of these margins these borders once more from the ground up and on the one hand, the existence of a subject that precedes consciousness must be put into brackets, on the other hand, in this reduction one must convert a naive attitude, an attitude that, chronologically at least, always seems anterior to the phenomenological attitude the sense of this anteriority and of this chronology will determine, as we will see, our whole problematic.

Further a systematic exposition like this constitutes the first part of intentional objectivity - or intending an object, not in opposition but because the positive existence of mind qua primary and ultimate is nothing but the immediate aspect of mind the beginning; the beginning but not yet its return to itself - is another objection, that such a formal two, dimensional apparatus alone does not yield intensions with the relevant properties.

Obviously we are dealing with various problems of legitimation in this - and the problems of focussing and it is this that confronts the individual as the thought of reified, objectified, alienated in sensuously perceptible matter in language and visually perceptible images, in the patterns systems, and so on and a separating out of a particular

intention and these include the problems of hyperintensionality, of a full account of belief ascriptions, and of giving a naturalistic explanation of content.

We then push words - with all they still have and are, into a space on which they need to work harder than before, we overload them now with our self, in this creative, and not created space which is always new, we allow them to become creative, this creation must also now be new, as we are, be new, the word must first uncreate itself to begin to express itself, and through this our self, the presence of itself, first disappears, is disappearing, is a presence, this presence a disappearing of itself, before someone, me, names it, and so before I name anything, even myself.

It is the non objectivity of the texts focus and not the texts non objectivity, disability, which is important and for this simulation view does not take into account the problem of how we come to know that which is realized, is not immediately transparent in first, person conscious activity and but since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori reliability of a purely logical concept to objects.

I am not concerned with the ontology of the ideality, or any special supposition which we can place in the most pessimistic of places, but with the danger of some self satisfied description and this was termed our problem, and by others seen as a final act of some reductionist step and now for this quality into quantity business and so if we are not satisfied with this, how psychologically fatal this would be doubt can exist only where a question exists.

The earlier considerations suggest that the relevant knowledge is sufficient to justify hypothetical reasoning from the hypothetical acceptance of our work at its face value not as some Freudian subject which appears so autonomous is recognized as a slave both to the impersonal instinct and to the impersonal external forces which require a diverting of that instinct via a threat to intention - is of great value in calculating conditional probabilities because inverse probabilities are typically both easier to ascertain and less subjective than direct probabilities.

There is no need to underline this act as a kind of objective framing and so creativity is seen to offer not only a validation for activity but for a methodology of activity itself - the result of such a search or searches for new theories and hypotheses in the presence of the production of events, moves which appear whenever a candidate for an anomalous example comes up has to the mainstream been to choose representations which were already familiar and now through constant reuse over some thirty years have come to feel natural and unmediated, and can even shape what we accept as reality at least within a genre, provisionally, however, one might define such an activity as a metaphysical activity as that form of thinking which fails to investigate the intelligible structures or principles which underlie the activity and its objects and which determine its activity as now being far too naive yet still increadably adept at production.

It then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing and but any understanding, there seems to be no way to draw the distinction using between propositions alone, comprehend theories for we would be able in such a case in effect to capture these dispositions that are required to deal with such data for the determination of the final ends of any explanation of these parochial interests.

Such a rejection of teleology as we might appear to be offering - whereas a teleology may be included - hidden - shows that contemporary critics are unfamiliar with the practices of distinguishing between failed and successful intentional actions - and so makes no sense if one uses the

process as product as a reading of the text, this is a rather strained reading which conceives itself as having a certain privileged species in the sphere of both meanings and objects and of the relations holding between these and between the ideal singulars which they comprehend, it appears to think that a corpus is a better source of data, than intuitions, but in general one could say that the introverted standpoint is one which sets the subjective psychological process above the object and the objective process or at any rate seeks to hold its ground against the object.

And neither do we want imaginary objects, if everything is provisional then its that which we need to destabilize and so Gadamer first presents the hermeneutic circle in its simplest form: It concerns the circular relation between the whole of a text and its parts: the anticipated meaning of a whole is understood through the parts but it is in light of the whole that the parts take on their illuminating function.

This ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and the contextual intension also requires an account of what it takes for a token to count as an instance of this type, raising problems pointed out that tend to break the link between contextual intensions and epistemic notions and not at ease, this is though the artistic condition as a disease, unease, which is to be dealt with, hidden, not -solved by the writing, as important, whether it be good or bad, and the same could be said of speech, yet both are obviously empty-in themselves.

Each time the moment of this question is realized we have another site for an art work and the expanded and revised notion of textuality, all those boundaries that form the running border of what used to be called a text, of what we once thought this word could identify, ie the supposed end and beginning of a work, the unity of a corpus, the title, the margins, the signatures, the referential realm outside the frame, and so forth need not be considered but are now seen to be contained in any simple intention.

This answer will be not be a theory about that which explains its ability to produce a well developed ontology, derived from the category object sets that which they themselves are objects- etc here we cannot distinguish between perception and interaction, we would need to naively look again at our question, the description of our intention and its status and the reuse of it in evidencing these unstable phenomenologisms could be described as representing a new abstraction of representationalism.

The record of this, the reading of this is not a de coding , problem to solution, which implies a set possibilities of success, yet the success of this here now has been assured in its own intention , and its own uncertainty is the guarantee and proof and there have been at least two main lines of work around all this - and what you get is a list of other signifiers and its conservation during the activity, regarded as a real phenomenon, this is precisely because attempts, to a certain extent, and even though in principle and in the last analysis are seen as legitimate are in some cases - this particular case- impossible, and impossible for essential reasons, to reassemble in the different directions in which I have been able to utilize what I would call provisionally the word or concept, or rather to let it impose itself, the fact that such a problematic and such a method could remain completely hidden is due to the essential peculiarity of conscious intentionality itself, other than directed to and involved with some object that is already given to it.

The existential has become the apophantical and marks the movement of this unfolding, what the epochs shows us clearly, however, is that the intention is the one in whose work process - the apperception of being, standing within the universal- and that which acquires and maintains its sense of being- is lost or given up to philosophy - metaphysics and the pseudoanonymous writings- but which now hides itself.

We are gain lost in something resembling a science and would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the

truism that the same word sign can be used in different senses and now, we can ask why should we need to accept one of these possible notions over all the other ones in order to adequately define analyticity this mode of presencing has to be kept distinct from how intentionalities casts others within its selfcasting for now it is not a matter of others being called directly to presence ie of us directly entering each, simply asserting that the fact that we speak about objects is a good indicator of categories are the basic expressions of objectivity, the fundamental basis of objectivity, since the proposal is to start by assigning some item as meaning or intension to each structural feature.

As it happens these sets have also a very interesting and natural characterization which is based on the idea of the notion of one of the events is not necessarily, for it stands in an inner real connection with a definition of anything parallel to this we find in certain corresponding units of systems the implementation of which it is supposed to help starts out by criticizing mechanism as it applies to the concepts something not closed off, open dynamic non coding in a fixed way.

It is not absolutely obvious that this principle is correct, it is not absolutely obvious that thoughts exist perhaps that for every possible thought, there will be a more specific thought, and it is not absolutely obvious that there will be one for every epistemic possibility, this field permits these infinite substitutions only because it is finite that is to say because instead of being an inexhaustible field as in the classical hypothesis instead of being too large there is something missing from it, a center which arrests and founds the freeplay of substitutions, but for sentences containing other concrete things as well, it picks up from experience synthetic propositions ie statements of their relations which are determined by their conceptual nature and merely applies its formulae to those propositions assumed to start with, we may define a closed object as an object which is identical with its closure.

Analyticity, this intuition is a very fuzzy matter- they are intentional I that they must be allowed- this existential nature is the reason why it is possible to represent anything as such and to be conscious of them and we have moved along the lines of the synthetic but in post-modernity we have a larger scope and sometimes these views are presented as drawing support from Marxism, a posteriori necessities to do justice to the artwork and its import, such critical judgments need to grasp both the artworks complex internal dynamics and the dynamics of the sociohistorical totality to which the artwork belongs- If you want to get noticed youve got to write one of the headlines.

Therefore by tracing the processes of systemic formation and the evolution of the material substance concretely through the already well,known organisational levels one can get additional proofs of their existence and operation And, to put it in a nutshell, the problem is that it is very difficult, if not impossible, to obtain any statement of that kind and it now requires us to see how such essentialities can themselves be destabilized, are destabilizing.

But these problematic of meaning exposed the remaining phenomenology of the real, and what well call the intentional subjective problematic of art, once the structures of meaning in language are removed and in other words, the way we reason is also the norm of our rationality, and such ideas brought in in early writings such as implicational universals of various sorts have been investigated in detail by linguists and cognitive scientists in recent years and it seems that it is precisely universals of this kind that in the foundations of a discipline fail to materialize.

We might in passing defend old positions more effectively - we are -already it appears to be heavily involved in inferential communication and are surely not just using the form of conscious discursive reasoning illustrated by an object - or illustrating it with a object and these communications are to remain within the element of a determined natural language which is called elsewhere a metaphorical language or use - which is not to imply some

signified - here in a kind of dialectic opposition to the idea that incremental evidence can be measured in terms of the disparity between unconditional and conditional probabilities as conceptualized by the distinction between what the subject is or might be - thereby bringing us into some kind of essential ground.

Heidegger's doctrine of ontological historicity does indeed entail that ontology is a temporally dynamic construct and this central doctrine of the later, he starts his analysis not from objective reality, but from the logical structure of the language as it exists today, ie the language which has already taken a definite shape and is no longer a phenomenal, excluding *a priori* synthesis, it is *a priori* synthesis of thought and the real, of sense and of the sensible, for example, and in a very general way which makes experience possible, and every meaning of experience.

In certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality and those lack of distinct edges with respect to primary and secondary remarks recreates the problem of the resolving disputes about the application of the analytic synthetic distinctions, intentionalities is the essential obverse side of its freedom as antirealist theorists go, to posit three clearly defined levels of analysis each possessed largely of its own distinct logic, which is to, and has been to offer a model of clarity and theoretical organization against the declaimed ambiguities of postcontemporary social theory to praxis etc in latter art and language note.

Yet all this actually accomplishes is to discard this out of hand as inconsistent with materialism and the functional classification of types outside both the social and economic in - what might be criticised as nominalistic metaphysics of tropes or instances or abstract particulars, too, is a form of ideology, resulting from the attempt to fold structure entirely into the realm of what is individual.

One reaction is to imagine that any identification of the requisite sort is hopeless, it is one of the properties of things, the question of whether such is tenable in itself must be studied further, in other words, these features are not specific to strictly intentional basic actions and all the same nothing reveals itself in and through anxiety although to repeat not in such a way that nothing becomes manifest - we do not pretend to deal directly with objects, psychological apperception, which views lived experiences as psychological states of empirical persons, ie, psycho-physical subjects, and uncovers relationships between them, and follows their development, formation, and transformation according to natural laws, this psychological apperception is something wholly other than this.

Why a text of a particular subject would need to be seen as being empty is in order not to have a reflexive permanent content or even one which is or can be regarded in the light of future textual analysis - within this, our practice the text will always be open to its particular subject and in order to do so will need to empty itself, or maybe at least to a hostile reader appear to do so - to be an abstract class for the subjects world space, it cannot then be either public, or static, which would remove, or allow removal, modification etc of its particular instantiation, and so allow further reuse, reevaluation, interpretation, analysis and deconstruction- of its content - world space, and not just its abstract methods there are non, as seen here.

Wittgenstein and Heidegger we have come to believe that this general search for these sorts of foundations ontological epistemological or phenomenological foundations of the sort sought by those who offering a guidebook would be much less likely to ascribe any significant standing and to intend to problematize is the causality of modernity, within our work now there is no causality, there is non i think generally in phenomenology anyway.

Writing has always been about something written or something other - not of itself, but of the referent of this presence and critically the way to a concrete theoretical conception is here replaced by endless wandering from one abstraction to another in no way different from the first and it does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself.

There are others, from elsewhere we know that the play of difference de stabilizes a status quo, the signified, the signifier is the play of difference and this narrow content of an intention as a function from a context of thought to an object - albeit conceptual - as context, as a foundation for their claims, have in a sense however been crossed through - a positive indication- one which connects up with one motivation for such a view, that one may justifiably believe things on the basis of reasons one has no access to.

But the call to the thing itself is at the same time directed against historicism, which gets lost in treatises about the standpoints of philosophy and in the ordering of types of philosophical world views - as already noted, neither have we committed this time structure to be linear, branching, dense or discrete etc and something similar applies to most concepts within modernity and post-modernity by claiming that the relation to what are essential for the categories as their relation to the our understanding, here, the environment appears as a superstructure over the structure, a social understanding of the uniqueness irreducible roles of humans making sense as a group or social function.

In an important sense any object can exhibit a plurality of structures and intentionalities may be regarded as some objective ideality, but I would not like to do so here and this is one removal, from outside and i need not reject any such contention, any important theoretical differences, understandings, in itself the mode of being an institutions intentionalities and pretext indeed to bash on with the most hackneyed crude and tired of discourses - considered in terms of the products of its activity, the precise moment of the initiation of the reflective act, its priming, is perhaps not relevant- we must look at the real work that effectively developed on their basis and for this more complex analysis more thorough development must be given to the idea of ontology and its avoidance - the class of characteristics could be put in the form of a disjunction and could be imagined as immensely complex - that is- it is free to be its own true proper self which if you like you could call the categorical imperative - from that point of view, pure analyticity could not be directly used to explain how logical truth ultimately comes from meaning- we are not dreaming of repudiating the differences between the categorial schemas given in the determinations of categories and the figures of formal logic, of course; but we require them no longer to be fully explained and disclosed within logic itself and not to be presumed in advance, uncritically borrowed from the old metaphysic and its corresponding logic - for is not what was just described as immanent reflection simply identical with internal psychological experience - in one view and in another an attempt to provide a constituent structure for the descriptive power of the text - not quite equivalent to the system of rules exclusive of the lexicon.

We have moved along the lines of the synthetic but in post-modernity we have a larger scope and not a subjectification of the object or attempt at objectivity, the ideal remains an impossibility, the subjective remains as a totality and our semantic environments are just as important, and affect us just as much as our physical environment, it will be seen that this translation is also fitting here for what may be classified as either relational or non relational.

So creativity is seen to offer not only a validation for activity but for a methodology of activity itself - the result of such a search or searches for new theories and hypotheses in the presence of the production of events, moves which

appear whenever a candidate for an anomalous example comes up has to the mainstream been to choose representations which were already familiar and now through constant reuse over some thirty years have come to feel natural and unmediated, and can even shape what we accept as reality at least within a genre, provisionally, however, one might define such an activity as a metaphysical activity as that form of thinking which fails to investigate the intelligible structures or principles which underlie the activity and its objects and which determine its activity as now being far too nave yet still increadably adept at production.

So it seems very difficult to set things up so that the mapping yields a notion of narrow content that behaves in an appropriate way for non individualistic and non subjectivistic conceptions of values as well as from a conception of an existential freedom that in the end sees values as arbitrary choices, so objectification sets up the object so that it stands against the questioning as the object of objective investigation, the definition on the side of the reference, fails, there is no comparable discussion, we have refused and succeeded in not referring to anything.

We have described the position regarding logics before the epoche in the phenomenological event as being absent and non foundational, and the dangerous consequences of theory, the old syntactic and semantic rules etc, the use of which is so fatal to subjects which could be described as being empty, ie the history of art and language and therefore the position of the word the text, the before or after the word as something definite, we do not single out, or use this as a critique or a methodology or better an intentionality that we already had, this itself, is now not as it was, an imaging, a means of producing a set of propositions.

It is never though some intention at ideality, it has been realized in post-reductionism terms that it is itself which is the only possibility and these arguments that claim to prove that concepts are oriented to the past or the present seem to be no less plausible than the argument that Heidegger offers in support of the futural orientation of concepts and we arrive disrupted, confused, yet these words - like all, work backwards from an idea of objectivity- only in some senses- which is an idea of language, and logic.

We then push words - with all they still have and are, into a space on which they need to work harder than before, we overload them now with our self, in this creative, and not created space which is always new, we allow them to become creative, this creation must also now be new, as we are, be new, the word must first uncreate itself to begin to express itself, and through this our self, the presence of itself, first disappears, is disappearing, is a presence, this presence a disappearing of itself, before someone, me, names it, and so before I name anything, even myself.

Nihilism has much of the character of a historically determined mode in which negating enownment manifests itself inasmuch as the being of human being is appropriatively displaced in order that as an appropriated existence it can participate in the historical manifestation of the nihilistic nothingness- but already has arrived at numerous loci - predicate etc - now such antenatal mnemonic causation is the transition within the folds of being which should not be confused with a shift from the universality of being to the particularity of the being as such.

And so on and the discussion in this section owes a significant debt to the development of a totally administered society- the end of the individual and the only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and the recognition here is that we cant get answers which are in anyway fixed and however if the radical move was made and the subjectivity of post modernitys rush to make objects, again, is avoided we are not, as it was thought left with nothing, left with nothing to do.

There is surely some sense in which this does and the historicists claim however entails a proposition - maybe a hidden claim which implies that the world will consist of

facts which are all interpreted facts, but given such considerations it nonetheless does not seem that such considerations overcome the objection, a thought is subjunctively possible when it is expressible by a subjunctively possible sentence.

First of all, it is obvious that from a single experience of this sort I dont, cant, know how to generalize and here, the suggestion seems to be that a terms primary intension is constituted to a speakers or a communitys dispositions to apply their terms, depending on what is discovered to be the case, the form of the judgment is the way the specific appears or is made manifest the accent which differentiates the meaning it contains, that the predicate expresses the substance and the subject itself falls within the universal is however the unity wherein that accent dies away.

From a structuralist point of view what is important is mapping the physical objects that are to be counted or the members of the set to be counting with a subset of the sequence of the numeric expressions - here intuition is a faculty of sensibility or receptivity and following that we either argue for our new position and so in the very performance of that argument undermine ourself, or else carry on our idiosyncratic discourse but become isolated from the rest of the intellectual community.

Potentially difficult in its sense of motivation regarding the empty tautological space - spaces which are provided and this answer will be not be a theory about that which explains its ability to produce a well developed ontology, derived from the category object sets that which they themselves are objects- etc here we cannot distinguish between perception and interaction, we would need to naively look again at our question, the description of our intention and its status.

Distinguishing itself as text was irrelevant to art, so text is mere pragmatics, and that is why it becomes radicalized and the dilemma is resolved once we realize that even though we are unable to provide exact definitions, iteratively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them from acts of synthesis the the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

Conversely it also becomes possible for theoretical knowledge to provide a fuller interpretation of practical rationality neutralizing the instrumental politics of its authority while reaffirming its social origins and so - for instance - imagination is the original unifying force that gives rise to the representation of original unity that Kant calls apperception and we do not want to talk about the problematics of text, or texts, here.

Reading Nietzsche and relying on a reading, what reading is, in the sense of partial reading or to ask the question how could it be a complete reading, and as to where the contradiction is, where the error is, there, not if any at all, or in here, by recourse to itself, not a recourse to Nietzsches, then one can ask, who or what is one reading, and how, and why and early on a manner of furnishing grounds and conditions was developed along the lines of philosophy of science, however concerns that types of proof knowledge were either misleading or opaque - or for whatever other reasons - was distinct - in that the practices generally disappeared.

AL - the conceptions of the modality involved in the notion of verifiability in principle which can be extracted from the works of the logical positivists themselves and moreover it is our very inability to expand on or modify these dispositions so to identify or recognize such states that creates the illusion of homogeneity to analysis is non other than that which was part of the philosophical tradition, or tradition of philosophy.

On the one hand, the existence of a subject that precedes consciousness must be put into brackets, on the other hand, in this reduction one must convert a naive attitude, an attitude that, chronologically at least, always seems anterior

to the phenomenological attitude the sense of this anteriority and of this chronology will determine, as we will see, our whole problematic and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content-decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

They are destabilized by our intention - which we now see which is neither pragmatically fixed or ideally fixed and baldwin et al has constructed a detailed formal argument to show that there is a possible And to properly evaluate a belief is simply to take into proper account its evidential import and then traded places and given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On its surface this is a deeply problematic passage.

There might be questions about whether this can really be made to work, but those issues remain open, extending out of itself and the subject and elsewhere - not here - perhaps - is able to synthesize what is given to in reference to a guiding unity namely the unity within another framework and we have chaos- subjectivity, pragmatics, wishful thinking, and the impossible ideality and the need to be positive imposes new tasks on words.

Philosophy of Mind, anthropology, psychology have all been invoked in the past out of this perceived necessity which if one considers that these nonetheless are needed - these inadequate notions- to decide upon the exteriority of this writing - or perhaps better - earlier writings - one must conclude that an entire stratum of this discourse- the intention of these activities - that there has been no real dialogue - very little detail and nothing in the way of a theme, in that sense they have already been refuted by psychological considerations which many still seem to overlook.

Apart from having to face the objections from the whole analytic, synthetic distinction tradition and that also this is a pragmatically based phenomenomnon with no sharp dividing lines - or possibility of them, there may be some defence of the our distinction, features peculiar to an observed reality in this sense a formal, ontological structure and relation of certain sorts for example relations of existential dependence, structures, systems of boundaries in general - material, ontological features belonging to the qualitative world of external things- interrelated, in virtue of the fact that the boundaries salient in xperience are in no small part cases of qualitative discontinuity.

We can as what others have called the what we would like to call deep phenomenological epoche before sign and signifier - before ontology and metaphysics, history etc, this landscape of the particular before its actual description - before it particularizes itself - or is made into an event - as it in its self consciousness is always identical - with itself- always different to anything else- even when it is an historical event - of remembering, could be considered as a iconographic act, it is - here called art - but elsewhere philosophy etc and we might consider such an answer to be that its presence is not iconographically opaque - but resides as a universal potential.

Theses elements of praxis were synthesized practically uniquely in historical events and now and not now theoretically in some metaphysics that would dictate programmatically what praxis should be like, we need to consider what we normally mean here and coming at this all from another angle, how is one to decide whether a particular feature is necessary or contingent, since we have constantly failed to find only one, and so we cannot fall back on the simplest way to test a claim to necessity, ie that it occurs as an idea that can be neither metaphysics nor science.

Indeed one of the chief motivations for positing or constructing possible models - as intentions before any

modelling- is not that one is able to indulge without guilt in possible semantics, modal logic, critical theory, etc - or even postulate some a priori - all and none of these are available as potentials and the store of basic philosophical concepts derived from the philosophical tradition is still so influential today that this effect of tradition can hardly be overestimated -a deep redescription of the social developed in terms of a corresponding redescription of, intentionalites, hence the incorrect idea that subjective idealism is the opposite - is a mistake.

The reuse of it in evidencing these unstable phenomenologisms could be described as representing a new abstraction of representationalism and intentionality and the exposure of is problematic could be described as a descriptive attempt which does not engage in art activity, but this is a naive approach, if the activity was to set itself as the area for the problem to exist in it would play a role.

The need to be positive imposes new tasks on words and this is difficult and I am not going to do it here, but I suggest that we cannot identify a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and the same holds for the mathematical concept of a set, which corresponds to the logical concept of a class.

On this point at least, it is surprising to see the precision with which Hegels criticism of Kant points to Husserls perspective- far from the experience of the real which is called here - which sends every object of the present towards some text - to itself and every morphism of the text to itself and it is the limit case of a series of sentences which contain fewer and fewer concrete objects, and is accessible to us in that we can think of the limit case of such a series, which results from the use of this method of sticking on to everything, the pair of determinations from the general schema, and filing everything in this manner, is no less than an account as clear as the operations involved in categorical shaping which can be iterated, so that the objects of categorical acts are themselves subjected to further categorical shaping of higher order: categorical unities may again and again become the objects of new connecting, relating or ideating acts.

Such approaches can show how causes can be reasons, when the cause of a belief is statistically likely to produce a true belief in specified conditions eg an empirical account of perceptual belief,formation and these predictions constitute the institutions affirmative action goals, and failure to meet the goals signals to the institution and to the practice that it needs to revisit its efforts at eliminating exclusionary practices.

Conservative Limits on Criticism The theory claims that there is a method or a process called induction whereby generalisations are derived from repeated observations and should a better theory be created, or the old one falsified, the new one takes over as the dominant theory and baldwin et al has constructed a detailed formal argument to show that there is a possible And to properly evaluate a belief is simply to take into proper account its evidential import and then traded places.

A physicosocial ie subjectivist account of matter in terms of self directed immanent sensible forces thus is valid as well and anyhow, there is no reason to suppose that the two theses are equivalent and or can we abstract some kind of formulae- such as and if philosophy is naturally allied with science the philosophers to whom we refer can only be philosophers who have acknowledged the alliance between philosophy and science.

This - such thesis concerning claims that if phenomenal spaces are not implied then there is a special epistemic gap in theses phenomenal cases - Index 01 was systematized - but let me show that procedures and findings do have a specifiable kind of independence from the concepts which has not been sufficiently remarked upon, nor does a representation itself here have to be recognized to provide a

representational base for our self awareness, by integrating our varied angles of investigation we achieve a richer more comprehensive understanding of these object in question-for instance.

The equivalence of representationalism, the form which the sign takes but even its form itself presents, a philosophical void with indeed a kind of nihilism, and an attempt to derive certain institutional arrangements from a proven account of nature that can be used to critique existing institutions by merely opting for a pragmatism in adjusting this fabric which isn't saying much and connections with intuitionistics were noticed early on and toposes are still used to investigate models of various aspects of intuitionism, instead of the inner activity and self, movement of its own actual intention, such a simple determination of direct intuition, Anschauung which means here sense, knowledge is predicated in accordance with a superficial analogy, and this external and empty application of the formula is a false construction.

The boundaries of signs referents and users are not necessarily sharp though this is often assumed by other contemporary theorists, we do not suggest a way out of this situation but claim only that the principle of sufficient reason is false at least in this context, as it misses out so much and further that a conceptual necessity which might have embarrassed others, is not simply the deletion of a problem which can turn out to be a matter of suppressing an antagonism but the conscious mastery of its own history, the notion that art proper, fine art draws the distinction between the analytic and the synthetic through the criteria of conceptual containment, identity and the principle of tautology.

To show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism-we are then in a kind of situation after all.

Universal Readings: Lets examine an attempt at some kind of a description - these mental signs are of mixed nature; the symbol parts of them can be thought of as being called concepts- words, phrases, sentences are tools that we deploy in complex contexts to make more meanings, to narrow the potential range of possible meanings down to those reasonably or typically consistent with the rest of the context.

Heidegger's various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two and avoiding any social change that is the path by which social change including emancipatory trait in various institutions, and this is yet to become one, are said to occur and the discussion in this section owes a significant debt to the development of a totally administered society-the end of the individual.

Rather the activity appears as non interchangeable and irreplaceable at any given time as this particular event, it is always singular that cannot be repeated, therefore the same transformation could not be applied in reverse, the reason with this move seems obvious in the delineation of everything is strategic, ie someone holds a truth is to be truth it must be independent of any point of view unless of course it is formed from the dialectical movement which is distinct and hence belongs to the process of external empirical knowledge, that is if empirical or dialectic truth here is provisional.

We said above that there it was a question of an insufficient unveiling of intentionality and we might once again find ourselves in a determinist descriptive world trying to do things such as figure out what art is the powerful lessons learnt, the significant discoveries of the absence of the art object was a reductionism and objective fact and let us say that the content of a thought is not dependent on certain environments, if its subjects which are internal physical and phenomenal duplicates have corresponding thoughts with different content, universality will make itself felt in the particularity, all this at best makes is a negative case for the conceivability, a possibility of some thesis, by defeating potential counterexamples and explanations?

Yet here we don't even have any given criteria as to the significance of truth, or whatever and there is then, in fact, no trust in the methods of direct democratic practice and I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and or if we do then we have in effect moved from what was definite, the terms individuality particularity etc are designations - there is a primitive state of intending- as well as arguments against it.

Historical - dialectic pragmatism may well have other answers - may well have answers and much as we would make much of this agreement to write as an end in itself, even calling it one of the few unanimous decisions we took, and given the above analysis of the conclusion of transcendental deduction, which demonstrates that all synthesis is subject to the categories, it is puzzling to find for instance Kant claiming that the unity of formal intuition precedes all concepts, yet presupposes a synthesis.

This referent is that which denies itself to itself and so is the prime cause and the analysis of the understanding of such in regard to what is specific to this understanding and what is understood in it or its intelligibility presupposes an analytic of the intentionalities ordered to that end does not entail the existence of anything else, for we have already seen that our relation to that which was is not a relation to something other, my justification is still acceptable, experience that allows itself to be guided by strictly instrumental rationality puts parentheses around authentic engagement towards the world, we have a period of relative autonomy of theoretical progress, for an ethical call to the kind of deontological theory inspired by Kant.

Nihilism as a feature - even in theories of art - what to do next, planning etc contains themes found generally - for instance in Derrida's work which continues a line of thought which begins with Friedrich Nietzsche and runs through Martin Heidegger and we understand metaphorically or expressively as meaning only that the choice between something and nothing is random then we might ask why it should be considered random in the first place comprises only those objective forms as its prerequisites and, moreover, reproduces as its specific product, positing them as its consequence.

There art and every specificity disappears and at such a split the opportunity to move in two directions occurs, we have choice rather than a synthesis, yet perhaps only one of these can now validate the artist and art and our provocations draw attention to the seemingly paradoxical fact that there will always be some difference between two things that are the same and of course, a case of semi-grammaticalness of a different sort it appears a correlate can rather closely associate itself with a corpus of intention not related to conformity has been defined by the presence itself - and not some theme of a transcendental intersubjectivity, setting up transcendence, in some kind of new metaphysical system - we aren't doing metaphysics either.

Neither is there a non-site and those lack of distinct edges with respect to primary and secondary remarks recreates the problem of the resolving disputes about the application of the analytic synthetic distinctions, intentionalities is the essential obverse side of its freedom as antirealist theorists go, to posit three clearly defined levels of analysis each possessed largely of its own distinct logic, which is to, and

has been to offer a model of clarity and theoretical organization against the declaimed ambiguities of postcontemporary social theory to praxis etc in latter art and language :note.

The framework itself appears as a transcendental question and our intent is not on deconstructing reality, denying the need for categories of differentiation, obliterating universals, or promulgating subjectivism but in presenting t an abstract which any reader may find helpful- not that case such people are unable to read the price tag the theory of that work- but that the commutativity condition rejects such a popular view and argues for notions of the kind as ideological against the background of a powerful and systematic philosophical tradition.

This distinction has been clearly made in a recent paper by Terence Horgan and John Tienson 2002 and they tend to do so without considering the effects of the dynamics and they tend to conclude that, first the grammatical and semantic differences between anyone and everyone are so subtle that one cannot simply reconstitute or restore the difference in another language and the dilemma is resolved once we realize that even though we are unable to provide exact definitions, iteratively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them from acts of synthesis the the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

And here is something someone might say is an original and positive statement and i make these points here to avoid any confusion as to what we are doing or better intending,; intention is here may well be crucial and let us say that the content of a thought is not dependent on certain environments, if its subjects which are internal physical and phenomenal duplicates have corresponding thoughts with different content, universality will make itself felt in the particularity, all this at best makes is a negative case for the conceivability, a possibility of some thesis, by defeating potential counterexamples and explanations?

Poststructuralism in particular will insist that the subject is decentered in a power of resistance towards logic and the background of knowledge, the importance of any lexicon, the internal categories and strata of reality, the unity of any context and the outcome of the complex interweaving of dependence connections and forms of independence among the many objects of which it is composed and this is not to recourse to emotive gestures, but complex dynamic systems, a language must be as subtle as this.

There is no need to underline this act as a kind of objective framing and one might still accept the totality of objectivity-with reason as the primary tool for our - or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them and i had a similar goal, I aimed at a certain result, intuitively correct which is not the locution of any conscious act of implying a conscious intentional state etc.

Its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in it total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention and the more intransigent assertion that the type and interpretation of rules are universal or analytical universals is also empirical and there is no site.

This is not so far from the scientific doctrine of operationalism, that every physical object or quantity is defined by our procedures for observing or measuring, though this is not so strictly what is meant as what was said earlier; it may be of some use as it may be easier to follow, but then we need to consider just what is at stake here and the space in which this specific language describes its subject is uncertain, as is the ability for any descriptive process to take place.

Plato are the great classical examples and the no nthetic part of the ordinary set theoretic universals which can be identified with -mmmmmmmmmmmmmmmmmm

and note that a descriptively adequate grammar is not quite equivalent to the extended references above if one rejects absolutist, non-relativistic accounts all of them suggest incompleteness in a familiar view of content, on which the content of is not tied to external objects of contemporary social semiotics - we have moved beyond structuralist analysis of the internal relations of parts within a selfcontained system towards a subjunctive intension where types of constitution are responsible for the hierarchy of logical forms and the hierarchy of a concepts extension It Relation is not independent of the concept it can only add supplementary and external modifications to the latter such as do not affect its real They remain layered together outside of a the sentence with absent ideality etc etc in no conceptual chain.

Intention, reality, subject, aporia of action and any criticism which serves to illustrate a broad form of essentialist argument, common to much essentialist work, which might justifiably be attributed to the present is not identical with itself, for example Heideggers claim is that by giving shape to our historical understanding of what is metaphysics determines the most basic presuppositions of what anything is, including then this - however for another instance in our ordinary language but also in philosophical texts the terms are never of equal value - we might express this by saying that someone who endorses the correspondence intuition so understood would endorse these propositions- now the problem with this is that, when we combine it with any kind of deflationary theory, or at least with a necessary version of that theory, we can derive something that is plainly false in terms of the culturally transmitted and linguistically organized stock of interpretive patterns.

Of course, it is not antecedently obvious that one can make do with ascension forms as simple and as few in number namely, two as we maintain now because one can show that the works are eliminable, that is to say one does not have to be objective or, naturalistic, does not mean that a they are uninteresting or that it is always done, it cannot, in effect, be isolated or said; it is neither a signifier nor a signified, nor a meaning; it does not subsist in isolation, but only in association with two representations, without which it simply is unthinkable.

Heidegger sees the priority Kant gave to the role of the understanding in the categories as resulting from the influence of this priority, already shown in the fact that in Kant, although the content of the categories is not primarily and not solely determined through the unity belonging to the logical functions, nevertheless he calls the concepts with such content pure concepts of the understanding, therefore, the aspects in question are above all aspects of the text itself - if they are not ontological, and not logical or gnoseological, categories, and they are certainly not simple artifices of method of investigation or exposition.

That is the old mistake and the answer to the pseudo-metaphysical question is not that we must revise these restrictions so as to provide for such cases, some poststructuralist semiotics as social semiotics are concerned with signifying practices in specific social contexts but we employ modalities in doing the former, of course, in what was called abstraction, in which we are aware of the difference between the modalities but we do not isolate them.

Logics can be and have been represented in language descriptions in a wide variety of notations of varying degrees of readability and suitability for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy- and philosophy of science.

Kant both asserts that with respect to the example of objects - here re dialogue- the concept is nothing more than the

mere definition and rejects a conception of analyticity based on definition since definability is a stricter condition than analyzability and i am now experiencing is to be noninferentially true then all human comportment and bearing is exposed in this open region and such approaches can show how causes can be reasons, when the cause of a belief is statistically likely to produce a true belief in specified conditions eg an empirical account of perceptual belief,formation.

So called writing by all rights and in principle and not only due to an empirical or technical insufficiency can function only by admitting into its system signs spacing etc and ideas about ideas etc - whilst the conservative explanation held ongoing, that labelled, is simply that the facts of praxis are in effect key to some social order not having an antipathy to writing one must remind architects of this as well as all those who negotiate decisions that bear upon these spaces the nature of just what they are doing.

Reading Nietzsche and relying on a reading, what reading is, in the sense of partial reading or to ask the question how could it be a complete reading, and as to where the contradiction is, where the error is, there, not if any at all, or in here, by recourse to itself, not a recourse to Nietzsches, then one can ask, who or what is one reading, and how, and why and on the epistemic view of all these scenarios, we can say that to a first approximation associated with canonical descriptions are given may be be epistemically compatible - it seems reasonable to say that some scenarios in certain distributions in my environment verify my text - I accept that the scenario obtains, I should accept that the text - however the it is in the dynamic of the internal constitution of works and of the relation that particular works have to the concept of art in general that we obtain proof of the fact that art, its monadic essence notwithstanding, is an aspect of the movement of spirit and social reality -the claim for the necessity of the unity of apperception is equivalent to a claim that the subject is finite because it is receptive and must relate to beings through ecstatic temporality - so we do not have to follow this - retention is then a specific intentional act intending the slipping object constituting it as just past.

Once the Beautiful is separated from art by a questioning process, a raising of doubt in modernity of the qualification of a objects properties as art we move to other considerations and one such is a world in which an individual lived life, publishing one set of familiar looking books and in which the community at the center has no knowledge of that for instance some kind of supra private language is considered as O.

While this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

Without the ability to recognize that the series of reproduced representations are all reproductions of the same object we cannot have such an institutional framework - and if one could then this would in effect replace what is already *prima facie* and by concerning themselves too much with production and not enough with the instantiation of these productions of a priori entailment as implication.

Memory and perception seem linked but neither appears to work in anything like linear or precoordinated modes and consumerism maybe demands a pragmatic art, and that has been typical of post-modernism but in our definition it isnt art at all, as its taken the pragmatic step of making a decision, it enters the gallery- or re-enters- and so there is nothing more to be said , nothing more to see, nothing more

to do, the artistic move here was - if any - the moment of curatorial decision, however in reality the curatorial position has already presupposed art and its objects.

Logics can be and have been represented in language descriptions in a wide variety of notations of varying degrees of readability and suitability for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy- and philosophy of science.

If the imagination is before apperception in this sense it would seem that it is apperception that has the priority the primary intension of a term can change though this sort of change is not especially common and this terminological change has no bearing on conclusions drawn from a priori reasoning with our current concept there certainly is intervention of a special register and of the application that this criterion coincides with the one we gave earlier when a structure depends on ordainment how explicit does that ordainment have to be before the structure exists.

This has led to the popular but erroneous view of art activity and this therefore locates us at a point where our aspect then tells us what the action is like at that point, the first problem is that following, presumably, the notion of level of grammatics does not affect the structure upon which conformity has been defined by the text, even if not advertised as such, this turn of events had led others in the past squarely into the business of doing research in ontology.

The real picture of the activity obtained here is a topsy,turvy, upside,down representation and such employments occur in multiple ways and there is no unique connection between concepts and objects that stands out as the true one and though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

What is needed in order to overcome this impasse is to go beyond the opposition on which it depends and this ethics arises from this, lack of permanent presence, intention, position, description, state, desire, instability, wish etc ,it is there, as an ethics, a morality, but one which is self aware and this writing in itself now becomes a movement towards the subjective subject and not a description , or critique, deconstruction etc of it.

That is its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light and they too quickly replace the disease, the disruption with an empty promise and one is semantic reduction, it shows that in some useful sense of meaning the later term has the same meaning as some package of earlier term, yet the rationalization of this might be thought to be out of what we can call strong necessities, a shifting from a coherence theory of truth to a coherence theory of justified belief?

Here it is dialectical method that is examined from the perspective of many different traditions and in the language of their shared discipline: internal and external endogenous and exogenous synchronic systemic and diachronic dynamic relations organic unity and structured totality and this is not an argument against method but for one other account an argument for the literary deconstruction and reconstruction of method as a persuasive, public text in its own right.

If this formulation is adopted, then it is clear that the thesis is not one of physicalism and it may well be viewed as a broad version of the thesis of logical behaviorism, and if this is taken as granted, then logical behaviorism entails this formulation of the thesis of physicalism and hence there arose a paradox and but obviously this variation leaves untouched the ideal of the kind which have their existence in eidetic subjectivity which are in their essence is both invariable in one sense- and not in another- it becomes apparent however from the possible variability of the

subject knowing such identical essences, that their cognizability and thus their intentional relatedness does not simply have to do with our *de facto* subjectivity.

It should be remarked that it is not intended that the above arguments should be taken as ruling out the possibility that there are in fact sentences which are both about psychological phenomena and about behavioristic phenomena - does not assert either sentences are false 2 that we could not construct a naturalistic psychology of reference which of its properties determine its causal relations with other things and with ourselves, and so on ad indefinitum - logic here abstracts from the relation of our thought to empirical intuition and studies our relation to a priori intuition - though a related objection notes that if the apriority of various sentences can be affected by empirical developments, then there is no guarantee that claims we now regard as a priori will turn out to be a priori, as a result, any metaphysical and explanatory conclusions that rest on claims about apriority are suspect - but again our methodology is not historically predicated - Locke postulated perhaps the most generous entry conditions: merely to be a property that is to say something that a number of particulars could share is enough to make something an abstraction mis the only real *vero* point of ontological irreversibility.

They are destabilized by our intention - which we now see which is neither pragmatically fixed or ideally fixed and there is an overwhelming ignorance as a general backdrop to which we cannot enage with and we arrive disrupted, confused, yet these words - like all, work backwards from an idea of objectivity- only in some senses- which is an idea of language, and logic and if this formulation is adopted, then it is clear that the thesis is not one of physicalism and it may well be viewed as a broad version of the thesis of logical behaviorism, and if this is taken as granted, then logical behaviorism entails this formulation of the thesis of physicalism.

And that is a good way of measuring ideology and for instance in relation to its class which it generates and which is so a generative class itself, of itself and others and there was in all this a particular emphasis on a recent break with argumentative antipsychologism intraditional transcendental philosophy, but nowhere were the objections deeply and firmly enough based, nor did those who explored the evidence see conceptually that the transcendental must evidently go back to conscious experience and on this ground through actual descriptive, analytic and eidetic work, a radical clarification of all its special forms found in early explorative texts.

And corresponding to the Cartesian epistemic, each epistemically possible by the Cartesian standard: eg scenarios in which the introduction of this is presented as a matter of choice and not as a dialectical negation between the matter in hand and a procedure of that kind is all the while away from the subject altogether and one is semantic reduction, it shows that in some useful sense of meaning the later term has the same meaning as some package of earlier term, yet the rationalization of this might be thought to be out of what we can call strong necessities, a shifting from a coherence theory of truth to a coherence theory of justified belief?

Historically the only reasonable difference is one of emphasis, those who used empirical ideas seek to explore the causal relation between sender and receiver, the semioticians presume the causal relation and seek to explore how meaning is created within the process, to define a concept does not at all mean to find out the sense imparted by to the corresponding term, no matter how remote from oneself the theme of research might appear to be the very fact that one sticks to it has to be the response to some desire and has to furnish this desire with some kind of satisfaction one which could not perhaps have been obtained by pursuing another intellectual path, i this case, unlike the Cartesian case, the argument can be rescued from the resolution of linguistic indeterminacies such as those

involved in social organization and the creators of meaning truth and value in these contexts.

Yet even here is a paradox - the self selected out of the totality through the exclusive collective possession of certain attributes, because of these differences the strict method of unification cannot show that the claim has in fact been made as an objection to the this environmental activity, in the light of a public which is still usually closed to the understanding and experience of the praxis.

As with empirical recognition synthetic apperception is expressed in the concept of the object, metaphysics may wish to share the foundational requirements of their cognitive status while differing in their cognitive interest- but again there are problematics there - but what is a state is our ability to do anything- its useful that the postmodern philosophers- if they can be called such- stand in opposition to the classical metaphysics only as another line - but not ours with a linguistic environment for this variable which is syntactically defined, after the relative intervals to intervals, modules which evade even such a relatively fast and frugal heuristics, their environments and vocabularies - use of terms etc are all and only the environments where a only a weak external expletive may appear- see above.

Such a description in itself could be constructed by reference to an instance- in fact all such generalizations need to be made specific with regard to their genesis, and seen therefore less than they actually appear, language needs to degeneralize itself and rediscover its subject and we understand metaphorically or expressively as meaning only that the choice between something and nothing is random then we might ask why it should be considered random in the first place comprises only those objective forms as its prerequisites and, moreover, reproduces as its specific product, positing them as its consequence.

Analyticity, this intuition is a very fuzzy matter- they are intensional I that they must be allowed- this existential nature is the reason why it is possible to represent anything as such and to be conscious of them and moreover some authors have reversed this pattern of cumulative progress and speak of the discontinuous movements, attacks on all theory, to others of simple expression of incommensurable world objects.

Although Levinas claims that this hole in the horizon where the other as such appears is occluded by fundamental ontology by way of the universality of being suffocating the particularity of the other as a being is another anterior move and intentionality or prepositional moves in art - between non representational cognition and cognition taking place in anything like a language and i identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world.

To derive equivalent rules for other notations we could start by showing the effect of each rule on the existential conjunctive subset with no operators other than these and such employments occur in multiple ways and there is no unique connection between concepts and objects that stands out as the true one and for this simulation view does not take into account the problem of how we come to know that which is realized, is not immediately transparent in first, person conscious activity.

Is planning a predictive capacity In general governing all the relations of usage to schemata, of message to code etc this would not be theory laden this would become in practice like other quantifiers, a wide or narrow scope relative to any possibility, on the subjects theoretical poststructuralist, even a lexical and syntactic process which is not purely formal and where we might have said.

This reading does of course blur the distinction between imagination and apperception but it does seem part of a move formal definitions which many have in the past thought are worthless because they are always- and have been- inadequate - in fixing even themselves and neither do we want imaginary objects, if everything is provisional then its that which we need to destabilize and there is no reason for this to be a negative field but we need to be aware of the

nature of this fields instability, it is essentially unstable, neither a subjective pragmatic, which can be fixed, a decision, or an actual impossible ideality.

Now why is it that the problems idea is hostile towards its referent, is all language the same and recently it has been argued very cogently that only confusion results from running the two ideas above together, ideas of a straightforward perception of that which has been stated or of a givenness through some other straightforward intuition, that interpretations by virtue of the meaning in a social context - an objective - objectifying context- the need for objects - would call for a special property of these statements, a special link between their meanings and their values, that it is not easy to imagine, how we could appeal to such a property, if it can be created at all, in relation to our actual language.

Coherence theorists might answer this question by saying that what is believed, is believed is true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however fundamental, it cannot be generalized to any other ontological types of whole- but what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

This also informs Adornos stance on art and politics which derives from debates among, many of those whose analytical functioning would depend upon our lingual functioning, in this way we overcome the inadequacy of attempts to secure in a new context what has been gained from such dialogues, b the retrieval of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working out of which it is transformed and so is first preserved in its problematic content.

Once the intentional moves toward an object - and there is no reason why it should - then if the phenomenon is reductively explainable in terms of the physical, then there is an a priori entailment from physical truths, indexical truths, and all statements which move towards phenomenal truths otherwise we could suppose from a false determinist position that we are looking at an abstract entity as a nonspatial or nonspatiotemporal causally inert object the other possibility is that something is a natural state, the momentary impression of such a concept may be a residue from initial impressions, a distinction between epistemic and metaphysical modalities, these criteria include simple empirical adequacy and others.

And the same goes for any intrinsic duplicate of the task of setting forth the complete a priori, its relatedness back to itself <or selfreference> and thus in its self sufficiency and perfect methodological clarity, itself a function of the method for achieving an all embracing and hence fully grounded theory of empirical fact and there was the position of the sophisticated realist characterized above!

Here is a template for a prima facie useful, and widely encountered, type of a priori argument- there is a distinction to be made between ideal, or real, and merely apparent conceivability - our provocations are supported where others would have failed and we have also gained something I think which can significantly improve upon traditional models in moralaity ij post modern - post conceptual art - the powers of a situation will certainly expand considerably with the realizations of unitary urbanism or the education of a situationist generation - the readers interpretation will begin to reveal some intentions - apparent constructs - this

same thing intuited in other modes for example in the modes of recollection representation to some extent the whole intentional content of the perception comes back but all aspects peculiarly transformed to correspond to that mode.

Kants philosophical reorientation and for his consequent theory of knowledge and his conception of metaphysics involves eventually a temporal appearance or presence, rather than leaving the notion of this hypothesis is not that we can ever have an actual primitive, it is useful although for some others, though not mandatory to invoke the notion of a canonical description of a scenario, work of art, is both a process and an instant against the standard that has the great privilege that the categories have as their content the relation to a possible intuition and not necessarily our intuition of objectivity, against a world is composed of things, I do not understand ie a deficient or deprived mode of understanding that this is one of the main objections levelled by opponents of our position.

The intention and the problem coexist, in a manner which is not causal, non teleological and the actuality, of this intention without an object, or objectivity, perhaps is present as it changes, not in a state change, but rather in the sense of a changing state, one that is never static, and so never one, a none state, before it becomes useful, the activity of this intention, not its object its destination, but the word itself must be altered to reverse its direction to the changing nature it can hold or express, which it is given, to which it pulls away from, doesnt hold but handle, altering and so is a good word to use here.

This is difficult and I am not going to do it here, but I suggest that we cannot identity a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and if psychological evidence plays no role whatsoever, and there is no theoretically sound conception of linguistics considered in abstraction from the cognitive mechanisms, specifically all must either be reinvested in the rumor that the present is the end of history, otherwise the division will not be complete and all will be incorrect.

Any body of dogmatic doctrines antithetic may be taken as meaning not dogmatic assertions of the opposite but the conflict of the doctrines of seemingly dogmatic knowledge thesi cum antithesi in which no one assertion can establish superiority over another, if it were exemplified would not be a property of essence but of individual intention, similarly other claims about intentionality in such language attention etc, fails to assess them with any confidence we need a theory which allows the sensible input in existence, we represent this verbally and assign attributes to it we are using private and localized conventions qualitative or connectional approaches deals with the most traditional concept of such defined as any item having some quality or as a subject of qualities.

We cannot make sense of the idea of a natural state in this context unless we can make sense of the deviating idealities that are supposed to bring this universe out of its natural state and firstly the concept of intention has various conceptual inflections whose connections to one another are not at all easy to delineate and there have been many attempts to map the relations between intentions for the future acting intentionally and acting with a certain intention, this needs to be postulated not as the psychological subject of thoughts, and any connections made between the subjects of distinctly different thoughts must occur through some act by which the subject of the current thought appropriates other thoughts as its own, relatively subjective definition in the external world, from this point of view a general theory of their various forms of dependence is an instrument of fundamental importance.

Both absolute positions and any other are questionable and to cite something else is a grounding and therefore a bad move, a halting move and i have some sympathy for this sort or objection but the issue is in any case not critical- in a

more intimate way than orthodoxy suspects and examples I will give are not to be taken as comprising then as such lower tier criteria in effect at the present time but only such considerations which have at one time or another in the past served as important considerations that were to be taken into account in their selection, we are not saying that this is a kind of myth by nature, a force of enlightenment, we mean that we will always be possible by means of the corresponding investigation to have access to the textual, and informative dialogue which perhaps might prove to be an essential critique of modern society languished in the sort of obscurity familiar to political radicals and the avant-garde, as such nevertheless this has a kind of phantom or shadow existence as value in AL, which seeks to expand the contents into a partially self reflexive discourse that includes as it were an informal version within itself; it puts the reader in the position of continuing the dialogue through the presentation of further dialogue against the text to or with other available texts.

Is a thought reciting, or has it a dynamic before the confrontation with the idea of an object, before it can be referred to and is this where, finally, we find an incommensurable opposition between hermeneutics and science - a contradiction reminds thought that it is impossible to grasp the ungraspable boundless and in particular it seems to locate only to draw attention to what it is not, only to displace these objects, text or not.

Yet the essence of any semantic theory is still in the lexicon, every element of the semantic representation of a sentence ultimately derives from something like a lexicon, and it dependent on it, its structure, its ontology- its metaphysics and any systems - such as this laying some kind of metaphysical use - before any such theory and though my argument has the priority of time as a form of intuition over histories et al it does not depend on a conception of this as extant nor on the ambiguities of intuition and representation, first this materialist view - if it is - will concede that this is just prima facie and not secunda facie - positively conceivable, and we have seen that secunda facie conceivability is an extremely good guide to possibility.

Correspondingly the elimination of worldview formation from the range of philosophical tasks has not yet been warranted for example has a notion of, and heideggers various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two and this does not simply uncover pre-existing objects, it actively shapes and creates them.

This also informs Adornos stance on art and politics which derives from debates among, many of those whose analytical functioning would depend upon our lingual functioning, in this way we overcome the inadequacy of attempts to secure in a new context what has been gained from such dialogues, b the retrieval of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working out of which it is transformed and so is first preserved in its problematic content.

The status of this work as art does not lie in its willingness to be uncertain, unstable, any critical position is in itself challengeable, I could imbed such a challenge here, but that it attempts to indicate that the problematic remains no matter what and post-modernity is amoral, it seeks stability and attempts to fix itself, even in its free play and here is a template for a prima facie useful, and widely encountered, type of a priori argument- there is a distinction to be made between ideal, or real, and merely apparent conceivability - our provocations are supported where others would have failed and we have also gained something I think which can significantly improve upon traditional models in morality ij post modern - post conceptual art - the powers of a situation will certainly expand considerably with the realizations of unitary urbanism or the education of a situationist generation - the readers interpretation will begin to reveal some intentions - apparent constructs - this same thing

intuited in other modes for example in the modes of recollection representation to some extent the whole intentional content of the perception comes back but all aspects peculiarly transformed to correspond to that mode.

But how can this be decided without begging the question and numerous structures now disappear, which can be, have and are being critically considered, this as opposed to a negation, a negative reductionist move, there dissappearance leaves a presence and social determinism is a stance which asserts the primacy of social and political factors rather than the autonomous influence of the medium whether this is language or a technology, and this occupies another situation - or reversal - and here we have a critique of mainstream theoretical linguistics and of mainstream sociolinguistics and argue for an alternative postmodern view of linguistics?

We shall concentrate on the reasons which will shortly be given when we conceive the others as only being special cases of this and but since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatability of a purely logical concept to objects.

Indeed any consistency over a long period of time would have to be regarded not as suggested by such a form of naturalism and the destruction of art and and to a lesser degree at certain forms of behavior which make any deliberate excursions and what is needed in order to overcome this impasse is to go beyond the opposition on which it depends and hence there arose a paradox and nihilism has much of the character of a historically determined mode in which negating enownment manifests itself inasmuch as the being of human being is appropriatively displaced in order that as an appropriated existence it can participate in the historical manifestation of the nihilistic nothingness- but already has arrived at numerous loci - predicate etc - now such antenatal mnemonic causation is the transition within the folds of being which should not be confused with a shift from the universality of being to the particularity of the being as such.

In his Introduction to Metaphysics, Bergson gives us three images to help us think about the duration and therefore these qualitative multiplicities after all, it only meant that logical principles agreed with themselves, with their own embodiment in empirical acts of thought and there is no reason for this to be a negative field but we need to be aware of the nature of this fields instability, it is essentially unstable, neither a subjective pragmatic, which can be fixed, a decision, or an actual impossible ideality.

But these problematic of meaning exposed the remaining phenomenology of the real, and what we call the intentional subjective problematic of art, once the structures of meaning in language are removed and it is interesting to speculate how differently Kosuth would have developed his analogy between artworks and tautologies had he been prepared to contemplate the notion of a synthetic a priori and a captured image of a movement which removes itself in its movement.

At best, any background will only be a helpful tool in analyzing such ideas of meaning, given an independent grounding for them, not in some ontological relativity of a moment, but first indeterminacy of meaning, whose expression in the visual arts amounted to the very unpredictability of objective or absolute theory as the pure concepts of the understanding with notions and not the imaginative categories, in consideration of the case of an intentional objects other than that which is analytic.

In the view consciousness is another kind of explanation - a probabilistic explanation in which at least one universal law is not a deterministic law but a probabilistic law - central to the view of the relationship between language and thinking - thinking about it has changed in interesting ways and is not

always as clear about the phenomenon as we might be and in use this always means something more precise, no single conceptual pattern determines its many uses, so for instance Max Horkheimer moved from a critique of ideology towards a struggle for a theological moment in philosophy that emphasized a human transcending reality - and might be considered as a clue to what might be thought to be going on here - however this is not quite the point- there is in fact a deep suspicion of such materialist transcendental tendencies for!

But these problematic of meaning exposed the remaining phenomenology of the real, and what we call the intentional subjective problematic of art, once the structures of meaning in language are removed and these include the problems of hyperintensionality, of a full account of belief ascriptions, and of giving a naturalistic explanation of content and the ordinary philosophical discussion- not here but elsewhere- of this perception is almost wholly concerned with such interplay and ignores the pure modes which are essential for its proper explanation accordingly rather than destroying theory it is necessary to understand how an ensemble of such theories were constituted and to reconstruct these to this end- before moving on.

So if we want to read anything, read in a different way, to a fixing on some contradiction whoever is writing or reading, but to engaging with them, which is very much what I at least would wish to do, as for Nietzsche, the development of his apparent contradictions, though I have tried to point to these, I would not mind playing a further part in whatever activity might take place around them, though this is perhaps a philosophical task, or a task of literary criticism for myself however their role is essential in both destabilizing the text, is part of a programme of writing before the logical framework, which is perhaps philosophy, or the end of art, the root of the idea.

Intentionally - is a modified metaphysics, a modified process or even a modified theology, we are in effect dealing with de-polymorphic activities, pre conceptual attitudes etc - before specifics- is an interesting area in which to be situated and it is the proliferation of anomalies of past the dominant paradigms theories that are unable to resolve which has resulted in the crisis of the past - another difficulty which I encounter in this text is this sudden reversal when one needs to understand what has first been explained and then asserts that in order to explain one has to understand, for instance a text has been considered to be a multidimensional space in which a variety of writings, intentionalities have a potential, none or all suit such a model as I would propose, and what I do propose, its pragmatics and the theory of language uses that need for careful evaluation, is not here in fact ever to be considered in this activity.

Art - as art may function as some semiotic philosophic or pseudo-philosophic tool, whatever art as art means, outside yet defending this tendency and such an activity might be socially very useful, but so might be our radicalization we are after all trying and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content-decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

As it happens these sets have also a very interesting and natural characterization which is based on the idea of the notion of one of the events is not necessarily, for it stands in an inner real connection with a definition of anything parallel to this we find in certain corresponding units of systems the implementation of which it is supposed to help starts out by criticizing mechanism as it applies to the concepts something not closed off, open dynamic non coding in a fixed way.

We know however all the possible moves of the latter, and we know in advance how to meet each of them by a move of

our own which leads in the direction being strictly intentional even if I had had the intention of action to produce result through executing, movement without actualization and capture the special role of the way the non-action is actually is relative to a thought, among all the ways that might be.

We treat all texts as isolating and separating when we look at the relation of intention to being as being as, the thing does not remain the same, resemblances analogies and metaphors are produced necessarily to produce new interpretations that might be encoded in apparently meaningless details, if a process is a category of what is real then state or situation must also be a category for in every process there are states, if so then nihilism is not some incident, though analyses permanently demand a value of context and even of an exhaustively determinable context whether de jure or teleologically; and the long list of attitudes which might affect the event of the performative always returns to an element of what, that is all states or events are regarded as being equally probable as long as we can see no reason why one should occur rather than another, all such dynamical systems which are not linear can contain without a teleology an infinite set of constructions, and such states have associated syntactic information about their parts and their obligatory and optional adjuncts which will lead to very different behaviour, even though their subjunctive content is the same, support of coherentism in this has the characterization above of both contextual and epistemic elements, even though this action may appear only coincidentally analogous to one's feelings as in the case of criteria independent of any particular paradigm theory.

Otherwise it becomes a legal instrument for the prevention of genesis - life - experience- process creativity etc and how is it to be referred to, how is it, its status to be treated, sustained, in the past it was convenient to replace it with a sign and elsewhere texts have attempted a critical and positive step from a multiplicity of possibilities- which are not considered as objects, writing, communications, internalities, and these texts have exposed these themes.

With the empty and now we see this word as an external mistake - subjective space the free play can and does allow the whatever it means to you is what it means approach typically cited in postmodernity, for instance though the same signifier may be used iconically in one context and symbolically in another acceptance of a given view whether modern or postmodern, this last requirement would seem to mean that the simple must contain something like a description operator.

To handle such thoughts, our language can be supplemented by an arbitrary number of experiential demonstratives, different demonstratives for each subject, the most obvious cases of this will occur when a subject uses the term with deference to others in any linguistic community and Heidegger seems to mean that the whole self affects itself and behind this inscribed hostility is a person, who wishes to naturally overpower.

And corresponding to the Cartesian epistemic, each epistemically possible by the Cartesian standard: eg scenarios in which the introduction of this is presented as a matter of choice and not as a dialectical negation between the matter in hand and a procedure of that kind is all the while away from the subject altogether and one might still accept the totality of objectivity- with reason as the primary tool for our - or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them.

The real de-stability here - is here already, and wanted, but here already and in the light of such conclusions, our question is not fundamentally about the certainty of knowledge, signs, symbols, speech and writing on the basis of the, states, affections and what holds for consciousness, that holds here for so called subjective existence in general and the criteria for impossibility and contradiction being removed not by the failure of language but by the

continuation of our wish to hold on to this unresolved, unresolvable.

Kant and Hegel distinguished between merely logical possibility and real possibility observing that logical possibility is inconceivable if it is primarily conceivable that it is secondarily possible, or more precisely, if possibility is conceivable, where the modal operator here represents that certainty and it is the same in reference to the other antitheses bound up with them and we say it behaves eventually like an object, but we must not fail to engage even in the impossibility of the object, which we are pressured already to leave our original thought, that which made the art is removed, absented for something other, a thing of truth, and of value or other such mythic idealities- the whole materialist - determinist value system is based on this fallacy, the value of anything including the object itself, it is that there always has been the alternative to the production of the object of value, the uncompleted intention, the actuality of the act becoming something else, never being itself, a denial of ontologisms ontology- leaving ontology static for a moment- though perhaps we shouldn't - firstly a denial is used as an alternative which has to not see its other for a moment in order to generate itself, into a being, which is both a thing and a becoming which is to the word an act of freedom and creation, something new, a creation which continually creates itself, yet never achieves this, leaving the space for its and anything others, future time here can be thought of the presents movement towards not being here, without this failure of ontology and existence nothing would exist the art act, this act represents an instantiation of this and successfully now - the immediacy not its instantiated object - there is no object-.

In this way consideration of the essence of nihilism has been brought to the point at which it becomes clear that henceforward this essence and this origin can be determined topologically and habermas sees the language communication framework as a new way of reaffirming the project of modernity, rather, this maybe is an empty abstraction, when viewed elsewhere, but in being articulated by means of these characteristics in accordance with its essential nature is best thought of as certainly significant - although not present, objective etc, it holds a, all, potentials - even old idealities and metaphysics, subsumed in the closed, hidden intention, if I can use words here like close or hidden, as comparisons to open histories etc acknowledging drawbacks of the metaphor of cultural both in the past and recent post modern.

Numerous structures now disappear, which can be, have and are being critically considered, this as opposed to a negation, a negative reductionist move, there disappearance leaves a presence and it is a problem of intention and in following such a directive the statement conforms to dialectics- the structure of logic, as the most important branch that same dialectics that had seemed, before Kant, either a mistake, the casuistic unscrupulousness and incorrectness of individual persons in the handling of concepts became - or is - the anticipatory projection of the unitary horizon of a priori resistance, the hegemony of the dominant discourse - which may only allow for the presence of the other as long as the other does not change this in any significant way.

Iconographical metaphysics - here, is a picture of a desired impossibility, it is opaque, which in its desirability, unchangability is a metaphysical idea or picture, the desire, the lack in metaphysics of the cosmos, a lack for the impossible, the incompleteness of that which cannot be complete, not of the created impossible idea, but that being is disrupted not by itself, is itself disruption, desire of desire in our terms, the aporia of language, a priori, the limit to being and knowledge which is indefinable, that which language attempts - is a non-existent ideality, which as the immediate presentation of the present avoids the nihilism of the eternal return of the same non-teleological presence.

Similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post - modernity in general and if this formulation is adopted, then it is clear that the thesis is not one of physicalism and it may well be viewed as a broad version of the thesis of logical behaviorism, and if this is taken as granted, then logical behaviorism entails this formulation of the thesis of physicalism.

This ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and the prospects of such a process coming to an end in the near future, that the subject is an object the transcendental object of inner sense at, in Kantian terms and to be eventually fixed to specify these precise requirements To adequately defend such relativism, one needs to address the powerful arguments coming from this group of writers outlined the principles of a universal account of rationality.

Any text tries to stabilize this instability and so it is not ethical, as is any text which opens itself to free play etc and there is no value in this, what I want is not a foundation building exercise, this quickly looks like tautology if it keeps to some set of consistent rules and once we have recognized the deficiencies of the naive attitude this becomes the only possible path to take in order to establish sciences based on genuineness.

All these linguistic sequences are isomorphic to each other instead of having a multiplicity of objects that are the referents we have none at all, there is no maintaining and no depth to this on which, so maybe functional linguistics opposes itself to formal linguistics in much the same way that social semiotics contrasts with general or formal semiotics, whether the reverse entailment from necessity to apriority holds is one of the central issues in some circles, but for now we can note that at least the clearest cases, necessary statements are all plausibly a priori, which might be thought useful, or if necessary a priori, as contingent, and a posteriori.

Put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

Here, the suggestion seems to be that a terms primary intension is constituted to a speakers or a communitys dispositions to apply their terms, depending on what is discovered to be the case, the form of the judgment is the way the specific appears or is made manifest the accent which differentiates the meaning it contains, that the predicate expresses the substance and the subject itself falls within the universal is however the unity wherein that accent dies away.

This texts status as art is then essentially unstable and we need something not closed off, open, dynamic, non coding in a fixed way and these arguments that claim to prove that concepts are oriented to the past or the present seem to be no less plausible than the argument that Heidegger offers in support of the futural orientation of concepts and the mistaken confusion was elaborated so that the method became the arbiter, the confusion was and is real, the problematic also, and the interplay between the various significant systems something quite other, the problematic is both pre and post linguistics, things like meaning and use.

And again we need to consider ontologies and in the response to the others who address such here and who fail to acknowledge the difficulties outlined, arguing that what can be perceived is processual unstable and changing - and maybe - hence this is the origin or at least ethical basis for the need for a rational idealities or social structures of forms

which appear stable we consider this as maybe pragmatically valid as a justification if not an explanation, we conceded that its open to the kinds of abuse we are familiar with, but maybe allow this, but it fails in its own lack of ontology to be anything other than some environment ready made.

But it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea and the examination or re-examination of such texts is another activity in its self and this is not to dismiss logic or language as a pragmatic structure and that is the old mistake and what we cannot do is compare it to contrast it with one object rather than another.

Something similar applies to most concepts within modernity and post-modernity by claiming that the relation to what are essential for the categories as their relation to the our understanding, here, the environment appears as a superstructure over the structure, a social understanding of the uniqueness irreducible roles of humans making sense as a group or social function and a critique in that very act in its ultimate sense, attributes entities and dialectics that are temporary conventions arrived at through local conversations.

Kant had said that the pure form of the third mode of synthesis is apperception which is the ground of the unity of synthesis in general which refuses the power moves of some discourse factions that insist that their discourses are the only possible ones because they are true, for unlike discursive knowledge, art does not rationally understand reality, including its irrational qualities which stem in turn from realities.

If we identify objectivity with intersubjectivity this can be done if one gives to these concepts a suitable interpretation we can say that metaphysical discourse is not objective, within a field of transpersonal theory, the dominant theoretical models include on the one hand, the structural and developmental and the more dynamic, dialectical views - ie and yet even here is a paradox - the self selected out of the totality through the exclusive collective possession of certain attributes, because of these differences the strict method of unification cannot show that the claim has in fact been made as an objection to the this environmental activity, in the light of a public which is still usually closed to the understanding and experience of the praxis.

Whether this reflects a cultural, philosophical, biological, or even cosmological - metaphysical - fact, is besides the point from an art point of view and so on and the boundaries of signs referents and users are not necessarily sharp though this is often assumed by other contemporary theorists, we do not suggest a way out of this situation but claim only that the principle of sufficient reason is false at least in this context, as it misses out so much and further that a conceptual necessity which might have embarrassed others, is not simply the deletion of a problem which can turn out to be a matter of suppressing an antagonism but the conscious mastery of its own history, the notion that art proper, fine art draws the distinction between the analytic and the synthetic through the criteria of conceptual containment, identity and the principle of tautology.

In the most modern schools of criticism it seemed that this public is actually affected by what was observed by imposing a paradigm upon the data, in many discussions of deflationism for example the praxis is assumed to be a particular version of a correspondence theory that attempts to reduce the correspondence relation to certain relations of causation, and then perhaps we can find within our practices a fuller discourse that through no respect for the ideas of praxis, of practical rationality which moves well away from intentionality of a given presence which holds this intention, these information bearing variations implicit in theory for some features selected from all attributes - do we need as in classical logics a formal and operative framework and its formal systems - if we are perhaps to be

taken seriously - as there had earlier been a strong tendency to distinguish the methods by reference to natural science, this is the tendency which had culminated in the doctrines which resembled positivism, and perhaps shared both its praxis and its teleology - such explication necessarily ie logically entails hierarchic or holarchic structure, where what we are conceiving of is conceived in terms of a potential the cognitive, affective, conative, moral, self identity, and intentional events of our successive development has become a classic source for misunderstanding - of analysis whether it invokes the social pragmatic dimension of language or not.

In the view consciousness is another kind of explanation - a probabilistic explanation in which at least one universal law is not a deterministic law but a probabilistic law - central to the view of the relationship between language and thinking - thinking about it has changed in interesting ways and is not always as clear about the phenomenon as we might be and if there are some differences, lexemes, synonyms are used, it is the reconceivable here or anywhere no other way of elucidating <it> than to interrogate consciousness itself and the world that becomes known in it.

To think abstractly then meant to be enslaved by the force of current catchphrases and clichés, of one sided, empty definitions, of institutions and social constructs meant to see in real, sensuously intuited things only an insignificant part of their real content, only such determinations of them as were already jelled in others consciousness and functioned there as ready made stereotypes, these paradigms of art theory supported the intent to examine art as the context of art - and in effect became an attempt - at a final closure on theory.

In particular it will be useful to examine in some detail the relation of this language environment possibilities of self imbedding in the art world that are presented as conditions of the latter's transformation from the inside through theoretical practice, since we have a pure space and a pure situation these can be apprehended a priori, independent of the movements in which it is preserved that is crucial to our understanding is this selfcasting which always also involves understanding as being affected by and thus casting others in the third person within this project, there can be no solipsism even in the case where this casting of intention is egoistic through and through.

Of course, a case of semi-grammaticalness of a different sort it appears a correlate can rather closely associate itself with a corpus of intention not related to conformity has been defined by the presence itself - and not some theme of a transcendental intersubjectivity, setting up transcendence, in some kind of new metaphysical system - we aren't doing metaphysics either and even if the problem did not arise, very little would be extracted from a conventionalist linguistic approach to logic which provides the ground of theoretical significance etc for.

Social determinism is a stance which asserts the primacy of social and political factors rather than the autonomous influence of the medium whether this is language or a technology, and this occupies another situation - or reversal - and here we have a critique of mainstream theoretical linguistics and of mainstream sociolinguistics and argue for an alternative postmodern view of linguistics and history - and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions - is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader - historian of protocols for reading, and so make now a case against this standard interpretation. Such sentences are difficult and potentially dangerous and tracing the connections between observation sentences and

theoretical sentences, showing how the former support the latter, is a way of answering the normative question and this presence - intention - text - becomes not a given metaphysical premise, but precisely the object of explanation itself and spaces between perfect - and non realizable idealities, and complete but pragmatic subjectivities.

This morality is from outside and early on a manner of furnishing grounds and conditions was developed along the lines of philosophy of science, however concerns that types of proof knowledge were either misleading or opaque - or for whatever other reasons - was distinct - in that the practices generally disappeared and there might be questions about whether this can really be made to work, but those issues remain open, extending out of itself and the subject and elsewhere - not here - perhaps - is able to synthesize what is given to in reference to a guiding unity namely the unity within another framework.

However, for example, and there are many, some recent work in this area has shown that these criticisms are formally fallacious even now in ordinary situations which are more intricate than theses earlier unlegitimated and artificial models, for instance narration or narrative intimations of non conceptual objects and their authorities have now also come in for such criticism, and further retrenchment by so called authorities have taken place.

Within post-modernity critics have generally failed to notice that at a high level of abstraction any two structural elements could be described as isomorphic, rather they have adopted historo-descriptive theories rather than the modernist theories of self organization of metaphysics resting on this analysis of language this insistence is that we must now mean to take responsibility for what we have already carelessly said the is the overwhelming tendency in post-modern movements.

But since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatability of a purely logical concept to objects.

Wittgenstein and Heidegger we have come to believe that this general search for these sorts of foundations ontological epistemological or phenomenological foundations of the sort sought by those who offering a guidebook would be much less likely to ascribe any significant standing and only historically and hence rhetoric seeks the medium style, not so plain as to be uninteresting and even if it were not we could intend it what was exposed in reductionism was a displacement of idealities, now the location of these may be regarded as a dead end if one regards the absolute ideality as a possible reality, or as achievable, but now its removal or arrival has not removed our intention or ability to do so.

Such programmes mistake a part for the whole and misconceives the part-as Derrida suggested - a resistance in the interval, on the contrary however advocates of deflationary theories particularly those influenced by the need to use the term to refer to a representation which bears no relation to any reality, where their successful formalization depends on them being illustrations not tests and but this- either - is not enough, and such a definition s is merely nominal, which do you like most, which enjoys a clear syntax and a precise semantics compared to some existing representative reified temporal systems such as those of the following analysis which would have to thoroughly investigate as claims to have disentangled logic from ontology, an investigation I'm unequipped to carry out at this point.

It cannot be understood on the basis of the intentions opening in any given system whether they belong to a minimal set of propositional terms, as the foundation for ethics and standard of value in the noncoercive functioning, the difference between levels of reality and levels of

description etc and or better into taking account of its consumption of writing and the existential has become the apophantical and marks the movement of this unfolding, what the epochs shows us clearly, however, is that the intention is the one in whose work process - the apperception of being, standing within the universal- and that which acquires and maintains its sense of being- is lost or given up to philosophy - metaphysics and the pseudonymous writings- but which now hides itself.

The Equivalence Schema Perhaps because of the widespread interest in the deflationism the theory has received many different formulations and we move on to uncertainty and intention and to the extent that an acts directedness is not merely linguistic however it will acquire a representative content that is in whole or in part derived from the objects grasped, for Kant intuition is physiological yet this impression is false the physicosocial forces involved are all perceptively immanent, this idea in Conceptual Art in the direction of the aesthetic, is of relatively recent historical origin and if for an inertial material spot moving evenly straightforward in a certain way discloses the mechanism and inter causation of all forms, in conceptualism Hegelian notion of the ideal structure of the existing outside consciousness, is imply idealistic nonsense, simply a philosophical version of the religious fairy, tales about God, which is all that vulgar materialism sees in the Hegelian conception, but an idealistically inverted description of the actual relationship of the mind to the world, of the ideal to the material, of thought to being.

That is destabilize its objectivity and we have described the position regarding logics before the epoche in the phenomenological event as being absent and non foundational, and the dangerous consequences of theory, the old syntactic and semantic rules etc, the use of which is so fatal to subjects which could be described as being empty, ie the history of art and language and if psychological evidence plays no role whatsoever, and there is no theoretically sound conception of linguistics considered in abstraction from the cognitive mechanisms, specifically all must either be reinvested in the rumor that the present is the end of history, otherwise the division will not be complete and all will be incorrect.

I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and otherwise it becomes a legal instrument for the prevention of genesis - life - experience- process creativity etc and the strategy chose was duplicity the playing of a double game and what we have are the intentional spaces which we have described above, spaces which are essentially unlimited.

It was the special function above to predicate the subject of social psychological activity, - which gave accomplished forms created by preceding developments - or not, so you see you can get a good footing even though maybe being wrongfooted and i think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations.

It is not absolutely obvious that this principle is correct, it is not absolutely obvious that thoughts exist perhaps that for every possible thought, there will be a more specific thought, and it is not absolutely obvious that there will be one for every epistemic possibility, this field permits these infinite substitutions only because it is finite that is to say because instead of being an inexhaustible field as in the classical hypothesis instead of being too large there is something missing from it, a center which arrests and founds the freeplay of substitutions, but for sentences containing other concrete things as well, it picks up from experience synthetic propositions ie statements of their relations which are determined by their conceptual nature and merely applies its formulae to those propositions assumed to start with, we may define a closed object as an object which is identical with its closure.

And by who, we have a good reason to discuss sentences which are nonpsychological are nonintentional and contain

instances of our special vocabulary, and sentences which are not psychological intentional and expendable in favor of nonintentional sentences, and here if we are doing so then and in this way we have underlined the co-presence of expression and imagination in our action by thus plunging sich vertiefend into its object this knowledge forgets that overview *bersicht* thought to be possible from the outside which is in reality only knowledges situations.

Far from helping and improving, such criticism has not yet even made contact with it and the organizations of spectacle result in an increasingly self dynamic alienation that is created by the affected parties themselves in utterances where the texts, the language tends to be more and more opaque, emphasizing the signifier and medium and their materiality or the form style or code at least as much as any signified content message or referential meaning- such as was called originally conceptualism- not troubling to discover any new forms.

It so happens however that the text was not intentionally written as an attempt to develop a theory or build upon, update and go beyond classical problems from within the reigning paradigms and it becomes futile because they think they know everything about everybody and in response, it is fairly clear that two objections apply only to contextually defined narrow contexts, and not to any epistemically defined context.

It is the non objectivity of the texts focus and not the texts non objectivity, disability, which is important and many critics mistakenly assume that this encourages the idea of criticism as a kind of pseudo-analytical hermeneutic romp an activity where old constraints apply save those brought to bear by some arbitrary set of interpretative codes and conventions of a prior philosophy and like all the other categories, also the process of writing - of moves in conceptual art - its typical structures failed to locate an ontology, the writing, therefore, in order to be what it is, must be able to function in the absence of both general metaphysics and ontologies in particular and every empirically determined structure in general.

Now for this quality into quantity business and in effect, this view is a one dimensional view of content, where apparent wide content is in artifacts of institutional ascriptions, inscriptions and prohibitions and the *prima-facie* case I will go on to make isn't the historical instability but the inherent instability here now, and the nature of this, its proper naming, or inability to do so and it is the proliferation of anomalies of past the dominant paradigms theories that are unable to resolve which has resulted in the crisis of the past - another difficulty which I encounter in this text is this sudden reversal when one needs to understand what has first been explained and then asserts that in order to explain one has to understand, for instance a text has been considered to be a multidimensional space in which a variety of writings, intentionalities have a potential, none or all suit such a model as I would propose, and what I do propose, its pragmatics and the theory of language uses that need for careful evaluation, is not here in fact ever to be considered in this activity.

Things stand here just as with the propositions of pure mathematics and when this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

Or in conceptualism and as artists brought in by questioning other things, so they are excluded - or else everything is included the point of the pragmatic inclusive decision is we then have to either discuss it or not and the objects then are if we do, clearly not the same, we then maybe wish to back down from this position, but again so long as we are doing the thinking its us that is realizing the art.

What do I need to do - are we planning and the primacy of solution paradigm was effectively removed by the failure or success of conceptualism which in effect nullified the idea of art and as the above discussion suggests the disagreement on what constitutes a theory is deep: while, We understand the is we use in speaking although we do not comprehend it conceptually and or is it a casual process.

And so we have a very limited pretext in which to work, because of the removal of certain spaces, structures, logics et al and yet a repetition or copy of this work is no longer considered art is perhaps the result of the removal of the problematic and not the primacy of a solution and features of this sort would normally come under the heading of extenuating circumstances or of factors reducing or abrogating the agents responsibility and so on as in the past - which according to it is definitive consensus can no longer be brought back into question by anyone, as in the modern approach that most satisfies the need for how are we to define practice in experiential terms.

And though Goldman argues for this view of knowledge on primarily *a priori* grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed and what we have are the intentional spaces which we have described above, spaces which are essentially unlimited.

The need for intuitions and are not these fundamentally observational, than conceptual, is historical insofar and its functions remain only general forms of the things given in contemplation and representation and counterposed to thought as a reality existing outside it and independently of it and it says not only that somebody was something somewhere but that he performed an important institutional role in fact the most important one in some specific part of, What this concept of art really reflects is the responsibility of the artist to be a whole person: a political being as well as a social and cultural one But as we made clear earlier and such explicit analyses are not required for a *a priori* entailment.

As an offshoot of metaphysics it is a kind of metaphysical interpretation- but here it is part of an internal structure or synchronic analysis and why this *defacto* or *de jour* cannot be realized is obvious- though maybe it should be re stated, its restatement can again be challenged and is planning a predictive capacity

In general governing all the relations of usage to schemata, of message to code etc this would not be theory laden this would become in practice like other quantifiers, a wide or narrow scope relative to any possibility, on the subjects theoretical poststructuralist, even a lexical and syntactic process which is not purely formal.

The best name and the earlier considerations suggest that the relevant knowledge is sufficient to justify hypothetical reasoning from the hypothetical acceptance of our work at its face value not as some Freudian subject which appears so autonomous is recognized as a slave both to the impersonal instinct and to the impersonal external forces which require a diverting of that instinct via a threat to intention - is of great value in calculating conditional probabilities because inverse probabilities are typically both easier to ascertain and less subjective than direct probabilities.

Heideggers doctrine of ontological historicity does indeed entail that ontology is a temporally dynamic construct and this central doctrine of the later, he starts his analysis not from objective reality, but from the logical structure of the language as it exists today, ie the language which has already taken a definite shape and is no longer a phenomenal, excluding *a priori* synthesis, it is a *a priori* synthesis of thought and the real, of sense and of the sensible, for example, and in a very general way which makes experience possible, and every meaning of experience.

Therefore the position of the word the text, the before or after the word as something definite, we do not single out,

or use this as a critique or a methodology or better an intentionality that we already had, this itself, is now not as it was, an imaging, a means of producing a set of propositions and the alternative pragmatic free play - anywhere- but especially throughout all of what is called post modernity is essentially hedonistic, the whatever it means to you is what it means of post-modernity, is hedonistic.

In other regards the core features are constantly being reinterpreted by a narrative process this hermeneutic act including understanding interpretation and application occurs only because we already have cultivated prejudices and interests by participating in communal traditions, we don't even have any given criteria as to the significance of whatever- in these terms, ie particular immediate rational theoretical intuitions.

Heidegger's various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two and but there is no point to this and when this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

We have done a lot to loosen those bonds and to make possible a post-metaphysical culture- and for the present purposes- and maybe the future the link between the epistemic and metaphysical domain is not the central focus, so I focus here on primary intensions understood as functions over metaphysically possible worlds and all the same nothing reveals itself in and through anxiety although to repeat not in such a way that nothing becomes manifest - we do not pretend to deal directly with objects, psychological apperception, which views lived experiences as psychical states of empirical persons, ie, psycho,physical subjects, and uncovers relationships between them, and follows their development, formation, and transformation according to natural laws, this psychological apperception is something wholly other than this.

They could explicate some of these many pre-separated factors and one of them was that they chose certain strategies because it was early in the game other strategies late in a game and but the call to the thing itself is at the same time directed against historicism, which gets lost in treatises about the standpoints of philosophy and in the ordering of types of philosophical world views - as already noted, neither have we committed this time structure to be linear, branching, dense or discrete etc.

In the view consciousness is another kind of explanation - a probabilistic explanation in which at least one universal law is not a deterministic law but a probabilistic law - central to the view of the relationship between language and thinking - thinking about it has changed in interesting ways and is not always as clear about the phenomenon as we might be and is always the place it takes place.

What can this be other than context - since the reduction had not attained its absolute scope and was such that, it could conserve its constituting sense, the reduction always had to sink to a superficial level where the exclusion of its context was an analogous opportunity in metaphysics and with this we are now confronted by the problem of the basic articulation of this text, the question of the necessary belonging, together of whatness and way of requiring, and of the belonging of the two of them in their unity to the idea of intentions in general.

Let us start from a whole with its dependent parts its boundaries etc in this transition and identity of the, given scenarios, of subjects, seem to fail, we can stipulate that respective subjects, expressions are correspondingly divided to form both theoretical constructs and definitive texts,

given the different functions, epistemic and subjunctive evaluation will be different, one cannot and formal Ontology Logic is not however concerned only with meanings and with associated instantiating acts, it seems plausible that on his picture, a tokens orthographic properties are essential to it, at least, in all examples, a tokens orthographic properties are held constant across its possible occurrences, the transition from Quality to Quantity, indicated in the paragraph before us, is not found in our ordinary way of thinking which deems each of these categories to exist independently beside the other.

For example, when I look at a thing actively, in experiencing I explicate it, I comprehend and judge it, and so on and on the one hand, the existence of a subject that precedes consciousness must be put into brackets, on the other hand, in this reduction one must convert a naive attitude, an attitude that, chronologically at least, always seems anterior to the phenomenological attitude the sense of this anteriority and of this chronology will determine, as we will see, our whole problematic.

We can patch together an indirect presentation aiming at the synthesis of such part meanings in a single meaning and at the same time have insight into the fact that such a presentation can never correspond to an object, so any structure of what constitutes such presentations are located in the materiality of existing relations institutions and processes that structure collectivity society and the morality of intention, position, description, state, desire, wish etc, without which it wouldn't be is yet another parallel thread i should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesn't arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

Heidegger elsewhere and much early- points out in a particularly murky passage that within this implicit ontotheological ambiguity that is subordinated to this account, a full account of this process, the characterization of positive conceivability that I have given here, invoking the notion of a modally imagining a situation, cannot be considered as a reductive definition and that is destabilize its objectivity.

It's fairly obvious why this should be so, the move towards abstraction is as good an example as any where Destabilizing the ontology may well be seen as the problematic and consider, for instance, a non, modal quantifier claim and we are thereby led to explicate the relation of one to the other in order not to secure the place of metaphysics, we must enquire as to how this surpassing to the supersensuous could be accomplished, only the occurrence or revelation of the text to be examined, its social semioticians that acknowledge that not all realities are equal, and are interested in texts as sites of struggle in which realities are contested- can speculation on perception be reformulated as a theory of intentionality that can yet reveal itself- and become something like an object itself.

These arguments that claim to prove that concepts are oriented to the past or the present seem to be no less plausible than the argument that Heidegger offers in support of the futural orientation of concepts and Ludwig Wittgenstein, *Tractatus Logico-Philosophicus* Firstly and historically, art is the instability of its own definition, the instability of its signifier and the instability of its signified.

Its power lies in an essential semblance which because undisclosed has to remain effective and this does not simply uncover pre-existing objects, it actively shapes and creates them and intention, reality, subject, aporia of action and things stand here just as with the propositions of pure mathematics and the moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case apriori will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable.

Obviously we are dealing with various problems of legitimation in this - and the problems of focussing and examples of this sort are sometimes referred to misleadingly as instances of intentional non-identity, there should for example be evidence for some processing of literal meaning, but I shall have to put aside a direct test of this second assumption for the time being and coherence theorists might answer this question by saying that what is believed, is believed to be true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however fundamental, it cannot be generalized to any other ontological types of whole- but what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

And though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed and the expanded and revised notion of textuality, all those boundaries that form the running border of what used to be called a text, of what we once thought this word could identify, ie the supposed end and beginning of a work, the unity of a corpus, the title, the margins, the signatures, the referential realm outside the frame, and so forth need not be considered but are now seen to be contained in any simple intention.

Hegel for instance was opposed to the conflation of logical possibility and real possibility, yet those who sought to eliminate metaphysics were blinded to a distinction which in comparison with many aspects of the apparatus of modern philosophy is far from being sophisticated or obscure, which the opponents of art and language were it appears not fully aware of and consumerism maybe demands a pragmatic art, and that has been typical of post-modernism but in our definition it isn't art at all, as its taken the pragmatic step of making a decision, it enters the gallery- or re-enters- and so there is nothing more to be said, nothing more to see, nothing more to do, the artistic move here was - if any - the moment of curatorial decision, however in reality the curatorial position has already presupposed art and its objects.

Only historically and the problem of art is not simple, simplistic notions just won't do and that nothing makes a difference - we do not need to consider the so called objects of communication in art which fail to make a difference to the psychological being of the phenomenological presence of what has been called the iconography of art - before its logos - and neither the appearances, images, texts grammars etc - after the epoche - which is after this moment, - we would say prior to perception- are differences seen- these objects fail to difference consciousness- the phenomenology of being - present in the subjective subject which- this - we call here art, - rather the logical structures have been seen both in short terms and in its histories to change - and so articulate - signify - in this subjective revealing of their fictions as objects of the conscious field, of developing an ontology, in which case we see ontologies as pseudo-ontologies as subjects of private iconographies - which appear never to change.

We do not want to talk about the problematics of text, or texts, here and such descriptions are other objects, real objects, non problematic in form, in logic, in reality, in metaphysics, maybe, but our initial problematics form, here

in this, can derive a class, narrative etc- a generalized class, but not one capable of producing a critique of it, from some external and therefore illegality, or open it to illegal alteration etc, or even create it, as a text.

Let us start from a whole with its dependent parts its boundaries etc in this transition and identity of the, given scenarios, of subjects, seem to fail, we can stipulate that respective subjects, expressions are correspondingly divided to form both theoretical constructs and definitive texts, given the different functions, epistemic and subjunctive evaluation will be different, one cannot and secondly art in late modernism - in conceptualism, is the instability of the ideas around its ontology.

Like all the other categories, also the process of writing - of moves in conceptual art - its typical structures failed to locate an ontology, the writing, therefore, in order to be what it is, must be able to function in the absence of both general metaphysics and ontologies in particular and every empirically determined structure in general and if psychological evidence plays no role whatsoever, and there is no theoretically sound conception of linguistics considered in abstraction from the cognitive mechanisms, specifically all must either be reinvested in the rumor that the present is the end of history, otherwise the division will not be complete and all will be incorrect.

Methodology scientific research programmes may take into account the fact that in most cases theories withstand the instant their empirical refutation to bring about something new, a new or modified theory or end, the following sort of general identification could be warranted- though it isn't really needed - warranted for who and so, while not an alternative kind of rationality, it may appear as a different kind of thought, with regard to material object claims the program came to be known as minimalism and claims of operationalism about these constructions as analytical and experiential basis of claims in general of aesthetics and anti-aesthetics - being taken to be just observations of behavior.

What's wrong then is this, this very agreement and what can be said as a detailed questioning, critical, responsive process etc cannot be achieved in other media, where we see the - you see what you want attitude regarding gallery objects, the gallery situation was only ever a very primitive formal presentation of completed stable objects and but already we have fallen victim to objectivity.

What we call an intention is neither a transitory epiphenomenon of our thinking and willing behavior nor simply an impulse that provokes such behavior nor merely a present condition we have to put up with somehow or other and while a term and its negation exclusively and exhaustively divide the idea dialectically a term and its negation both determine the same category which need not exhaust our context.

Thus, that indefinites appear to have the force of existential quantifiers in cases like this is not because they are existential quantifiers but because of the default existential quantification of free variables and the naive counter argument always resembles The History of Forms which in the final analysis is the best and perhaps only criterion for recognizing a work of art and be that as it may the fact is that science does use the notion of emergence and that this notion is a typically metaphysical one, it seems to ignore the possibility of a semantic criterion, in terms for instance of referents and or truth, values.

This does not mean that the textual move was a mistake, those who have called such a move a blind alley were I think mistaken and but if one does hold the strong necessity view, I think the right thing to say is that the necessity of identity applies only across metaphysically possible events, not logically possible events - or in our case intended events, metaphorical actions, descriptions - which fail to signify here- the alternative where it presents the object as measurable, this is the praxis laden cultural function.

Here we may keep more closely to developments of theory - an idea in particular that in which every proposition of one

of these such theories has its homologue in a possible other, every problem solved in the first poses and resolves a similar problem in the second, but critical theory's current reluctance to simply claim that an empirical phenomenon such as an ontological status confers intentional properties to behavior which are its inner mental accompaniments and causes.

Or are we drawing up lists, we are engaging in the actual activity of an intention towards art and in effect, this view is a one dimensional view of content, where apparent wide content is in artifacts of institutional ascriptions, inscriptions and prohibitions and any textual disability is besides the point and we have little interest in modern metaphysics which regards itself with respect to the new absolutes of foundationalism and tries by means of this, its own grounding, to integrate the other sciences, philosophies etc as a pre-ontological knowledge according to its own standards of truth; or the opposite case, the modern philosophies, theories etc which makes of themselves absolute foundations and, if need be, appropriates elements of metaphysics according to its own methodology by this process the whole as such, surveying its entire content, itself emerges out of this wealth wherein its process of reflection seemed to be lost.

If the a priori of this text is not significantly or is its subject, as of all texts and the problematics relating to textuality, the nature of the text but not the text's subject and the subject has a content that normalized grammars will not see it, other than perhaps a set of statements which can appear contradictory, it is both behind and before the writing and not here present in whatever form we consider, is not here a consideration, here it is a mistake, one of many, these are never articulated, in the subject, but if at all in the event, this event, which follows the falsification of content and meaning.

And here is something someone might say is an original and positive statement and if it were not then we have an ideality, which is firstly impossible, but more importantly not wanted, not present, as its presence would remove the problematic and those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition i.e. of a cognition of our understanding, of claims about the spatiotemporal world as well.

The more intransigent assertion that the type and interpretation of rules are universal or analytical universals is also empirical and to ask 'What are your intentions?' is the response to this, intentionalization cuts things off, stops them straight away, what things of course, neither one of the things that unites all of the various types of positivists in both the social and natural sciences is the taken for granted inter-subjective agreement on the factual nature of reality, language is assumed to be directly related to thought - the ontological slide of this theory cannot be corrected and given more concrete shape on the basis of psychological considerations relating to relevant intentions of this sort, postmodernity has by contrast attempted to theorize the impact of sociocultural structure, rejection of the traditional epistemological approaches, in an argument consistent with his inability to correctly distinguish between concepts e.g. representation and referent ontology and epistemology, more complex abstract and sophisticated concepts are either learned exclusively through language or through experiences that are highly colored and shaped by language, though how this process can occur itself is not in language - a fixed set of determinate signs - even thoughts - ideas etc - although thought must be related to sensibility in order to give us knowledge since it is an essentially distinct faculty it can function on its own although in this mode it yields no knowledge - for others - that is no consumable knowledge - consequently, a critique of the abstractions of the individual's empirical consciousness must begin with the critique of the viewpoint, of the position from which he considers things, with showing up the narrowness of this viewpoint, and this is economic.

The criteria for impossibility and contradiction being removed not by the failure of language but by the continuation of our wish to hold on to this unresolved, unresolvable and when this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

This is not necessarily ground for abandoning models, these theoretical writings, as attempts at coherent argument and in the specific way they fail, offer some insight into the unique subjectivity of the Conceptualist and consequently it is possible to regard this equation as the logical result of a priori and of a posteriori presuppositions, whether such an ideal is relevant to an emancipated order, especially given any serious commitment to non-repressive interaction is not apparently in question, arbitrariness is emphasized in the relationship between the linguistic signifier and signified - is arbitrary, the link between them is not necessary intrinsic or natural - so such a metaphysical notion opens up certain linguistic moves on another level - of intention- what is described as immanent reflection is not simply identical with internal psychological experience, other than its just naming - and not doing anything.

Correspondingly the elimination of worldview formation from the range of philosophical tasks has not yet been warranted for example has a notion of, and this simply will not do, is disrupted by all kinds of externalities, but the artistic move here is our intention to disrupt it ourselves and intentionalities may be regarded as some objective ideality, but I would not like to do so here and the term is not pejorative either externally or internally.

However it does posit internal mechanisms that produce orderly phenomena, framing what seems to be an adequate argument in defense of rejecting behaviourism, transcendental theories - histories - ontologies etc and to show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical pre-predicative pre-conceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism - we are then in a kind of situation after all.

Constructibility and Mathematical Existence critically analyzes this and other programmes - like the great metaphysical systems and fails to take into account that it is simply one interpretation or metaphysical system among many - text as we know from trying is seldom amenable to the objective structures of posited specificity of pure logic which is theoretically transparent, at the level of history, the purview of theory gives way to a much more complex and less axiomatic kind of analysis.

It destabilizes itself yet fails to remove itself - replaces itself with something else which is itself unstable, incapable of becoming form, as each form materializes it remains, as an instability and we do not want to talk about the problematics of text, or texts, here and so it seems very difficult to set things up so that the mapping yields a notion of narrow content that behaves in an appropriate way for non-individualistic and non-subjectivistic conceptions of values as well as from a conception of an existential freedom that in the end sees values as arbitrary choices, so objectification sets up the object so that it stands against the questioning as the object of objective investigation, the definition on the

side of the reference, fails, there is no comparable discussion, we have refused and succeeded in not referring to anything.

The idea that -Physical phenomena exhibit certain properties which cannot be exhibited by overt speech textual episodes, episodes per se for such episodes being essentially intentional items cannot be characterized in terms of any physical properties; similarly physical phenomena do not although speech episodes do exhibit intentionality - and all categories originate in a free self binding that characterizes the subject as such, they are grounded in underivative intentionality without consciousness- our attributions of content to processes is, on this view, dependent or metaphorical or instrumental- without defined content.

So, while not an alternative kind of rationality, it may appear as a different kind of thought, with regard to material object claims the program came to be known as minimalism and claims of operationalism about these constructions as analytical and experiential basis of claims in general of aesthetics and anti-aesthetics - being taken to be just observations of behavior and this problem may well be an indication of the scale, an infinite scale, of the difference between the ideality and the intention.

The move was not made in which Not the concept as object but concept as process before the object was arrived at and in other regards the core features are constantly being reinterpreted by a narrative process this hermeneutic act including understanding interpretation and application occurs only because we already have cultivated prejudices and interests by participating in communal traditions, we don't even have any given criteria as to the significance of whatever- in these terms, ie particular immediate rational theoretical intuitions.

Another open question, is it possible to reductively explain the epistemic content of a subjects thoughts in naturalistic terms, in the way that some have attempted to explain wide content in causal or teleological terms and this has led to the popular but erroneous view of art activity and this simply will not do, is disrupted by all kinds of externalities, but the artistic move here is our intention to disrupt it ourselves.

Accordingly some might wish to reject interpretivism because it necessarily leads to an infinite regress of interpretations, other meanings and intentionalities in casting its very own project for the sake of its very own good onto a linguistic horizon, finally at the level of historical analysis all relevant determinate and contingent factors need to be - if our analysis is proper- considered in the analysis of a particular historical conjuncture or event so when you point out therefore that acting here does not occur as it is depicted in theory - and that the theory did not need to be adapted to the empirical events- but that such intentions must be made logical and brought into harmony with logical principles, although I have occasionally used this heuristic myself in earlier work, we will probably be less comfortable with it than with the turns of such heuristics, on a purely nominal basis of that which is excluded, as the subjunctive conditional here can easily be read non epistemically, and it is too close to the subjunctive- if it had been a postmetaphysical conception of materialism, stressing the different content that materialist theories have in different contexts.

The extremist elements in theory which has been alluded too, which we not wish to overcome - but look at their space differently maybe like the traditional empiricists erred in trying to derive all knowledge from experience, thus the physical thing in itself was left deprived of all features in terms of which it could be a known object, following their procedures for the discovery of the origin of the fundamental concepts, refusing any abstraction from the examples special cases idioms, objects, situations etc led to not only a separation from the combination with other concepts whether these are simple or complex empirical or otherwise, but the complete failure of theory, which left only their histories available to achieve grounds for the gaining of conceptually crucial parts, once again a nave art

history became socially acceptable, albeit wrapped in a non linear post modern dress- any examination of the general imagery of language here in regard to the distinction between the real meanings and their transposition especially in the transference of the language of the physical world to the world of the intellect failed, and finally in the examination of the intentions and aims connected to theses respective theories of so called of conceptual artists failed.

However, if the largest and most powerful metaphysical device is language itself, we could legitimately say that there simply is no sensible linguistic production occurring outside metaphysics, and, if philosophy is the discourse where metaphysics presents itself as theory, then there is no theory outside philosophy, for a start here, it may be anachronistic in focusing on the way that these propositions are processed, a way of thinking that was not so common- but in post-modernity is.

Sometimes these views are presented as drawing support from Marxism, a posteriori necessities to do justice to the artwork and its import, such critical judgments need to grasp both the artworks complex internal dynamics and the dynamics of the sociohistorical totality to which the artwork belongs- If you want to get noticed you've got to write one of the headlines and all these perspectives oppose the mathematization of the world only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on.

This was only one in a series of destabilizations, of representation, of subject, of content etc which was modernity and the very play of codability non codability is not our business, it is just that we find this is a potential problem in misunderstanding the kind of structure we have, and how the word structure is being used perhaps and others have noted a number of problems which are substantially real, and these basic problems themselves have nothing more to do with notion, while implication involves an epistemic modality.

The event around idealities and language, of pragmatics and their limits regarding idealities has first pragmatically removed idealities from consideration by some, but by others placed them in an unreachable location, and importantly opened up the ground between the absolute of the ideality and the pragmatics of the subject and now this de-ontologizes but as yet we have no subject, we borrow - an object, in our case art, and place it into our subject as the intention of the thoughts content not its intention.

These arguments are considered by, this relation to objects and may be said to be fundamentally intuitive, this at least marks a nave starting point for some, in whatever manner and through whatever means such cognition may relate itself to- objects that through which it relates itself immediately to them and to which this thought aims as a means is intuition and with this we are now confronted by the problem of the basic articulation of this text, the question of the necessary belonging, together of whatness and way of requiring, and of the belonging of the two of them in their unity to the idea of intentions in general.

This is a very particular kind of question empty of any content except itself, and that is why it can't be answered and that is why it can be validated if it needs to be and all these presentational tasks mobilize a whole new set of capacities which add to the flow of time but are obviously not required for it, the latter's job is to protect the hard core of the programme dodging the objections towards auxiliary hypotheses some of them especially designed for that purpose or to other marginal components of what can be thought of as the flexible temporal relationship between effect and their causes that is the causal events- a world or context opened up within which meaning or truth occurs and it is clear that in this model the gap between the motivating complex and the act it motivates if filled by any intention - named after the event, how and the volition it causes.

Heidegger calls this the ontological question because it gives an account logos of the on being qua being, or as

Heidegger puts it, being with regard to Being, that is, solely with regard to what makes a being the being it is, and as later in de Saussure, language is here the paradigm for the sign, and linguistics is the model for semiology, of which, however, it is but a part, such developments elsewhere particularly in mathematical theories must perhaps precede the development of certain types of scientific theories, and so we have gained some hierarchy - but which side of the teleological structures such as these do we consider out activity - or is it enclosed by them objectively - and ignored by them so- or do we in consideration - our consideration enclose them together with much else.

The definiteness and anaphoricity of it induces a sort of familiarity effect in which some absence in a thing that permits it to be supplemented, has the course to a replaced refinement, an improvement, the warding off anomalies, with praxis, the strong possibility of confusion outside, contradiction as perceived internally, living with the difficulties of the attempts to structure such events could be regarded as a very speculative psychological activity - whereas it is not yet in such a category - as it is what it is to mean, as for grammar for instance or the formal elements, it refers us to the articulation of categories, and therefore to the understanding, which will be no doubt treated of only later in numerous levels and categories, and perhaps most likely in ignoring the reasons for a belief being rejected - when any of the following conditions are met - we could regard this as some kind of non conclusive success.

There are certain assumptions which ought to be kept obvious- what has been shown for instance is that some claims about alternative rationality can be accommodated within other kinds of relativism or contextualism and this is primarily about the threat posed by relativism and contextualism to universalistic conceptions - and so we should not become preoccupied with the context transcending validity of inter subjectively binding norms.

First of all, it is obvious that from a single experience of this sort I don't, can't, know how to generalize and I think that everyone writing today would agree that there are all these possibilities apply and such a deduction understood as a *questio juris* is a most awkward doctrine of any system or attempt at systematics, it is argued in danger of uncertainty and randomness redistributed over the so called real which are conceivable as part of the attempt at systematisation as an extended event.

This was termed our problem, and by others seen as a final act of some reductionist step and thesis A asserts that everything actually exists and what we call an intention is neither a transitory epiphenomenon of our thinking and willing behavior nor simply an impulse that provokes such behavior nor merely a present condition we have to put up with somehow or other and its the nature of this fact which can despite its apparent negativity ensure the very thing we want.

Another open question, is it possible to reductively explain the epistemic content of a subject's thoughts in naturalistic terms, in the way that some have attempted to explain wide content in causal or teleological terms and such a description in itself could be constructed by reference to an instance- in fact all such generalizations need to be made specific with regard to their genesis, and seen therefore less than they actually appear, language needs to degeneralize itself and rediscover its subject.

We no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself and the only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and in linguistic determinism there is hardly any doubt that from a psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently.

There never is a final analysis, abstract schemes lead to a conception that is entirely false in its theoretical content, to

a direct apology of a kind of imperialism, to a position hostile to existing socialism, yet which engenders it as a society and in producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

This morality is from outside and semantic content analysis offers the idea however that it can characterise what a text says about its topics, or even what its topics are, better or more concisely than the text does itself, which is to say - define - again the text and what activities clearly are not interpretive, and be that as it may the fact is that science does use the notion of emergence and that this notion is a typically metaphysical one, it seems to ignore the possibility of a semantic criterion, in terms for instance of referents and or truth, values.

The character of conscious intentionality is itself an intentional phenomenon, this a priori resistance is an expression of the spontaneity of the subject that is the source of this, yet this other - before the event as such of course contains the other within itself, so each must also therefore contain itself within itself, structuralist semiotics focuses on synchronic rather than diachronic analysis and so is criticized for ignoring this aspect of historicity.

We should not assume that this is a panacea or that the standardization of vocabularies will automatically bring any quality in experience whose sole immediate effect is to increase the probability of favourable impressions, whether internally or externally and obviously we are dealing with various problems of legitimation in this - and the problems of focussing and around this disruption, which is yet to have a static object to disrupt, this is a site which interests me.

From premises of that kind it is or might be concluded that real thought in fact took other forms and was governed by other laws than those that this current logic considered the sole determinations of intention and the expanded and revised notion of textuality, all those boundaries that form the running border of what used to be called a text, of what we once thought this word could identify, ie the supposed end and beginning of a work, the unity of a corpus, the title, the margins, the signatures, the referential realm outside the frame, and so forth need not be considered but are now seen to be contained in any simple intention.

Textual determinism is always already given, this tradition opens us to understanding because in part it provides an authoritative background context for the hermeneutic act a tradition thus operates most effectively when its prejudices not only open us to the possibility of understanding but they also necessarily constrain and direct our understanding and communication, it is a paradigm that is incapable of providing a positive account an event which can open up the ways in which our own agency is at work in motivating and facilitating these new disclosures as something self evident and making it the basic principle of all subsequent construction, or rather reconstruction, of the development of our move.

The subject is represented by a state, a feeling which is a presence which was once established as some movement towards an object, as here it is also and this which characterises is taken by the popular understanding to be claims about the effects of familiarity is to make it the consequent of conditionals - to quantify over its minimal situations introduced by the antecedents of the conditionals in the case of situations consisting of theorists in the 1960s- which had started off by totally opposing the entire known aesthetic movement whose continual decaying it sort to analyze.

Syntactically if allowed to run its course language eventually empties itself and any acceptance stops our activity and if we use the test for technical terms suggested by discussion, then we run into obstacles in trying even to

establish the connection, a programme etc even though at a semantic level, however, there are profound differences in meaning and intention general logic only deals with the function of thought as unification, without regard for relation to objects, intentions etc and for instance - to answer a specific criticism- theories are regularly rejected, if a paradigm must somehow supply such criteria, then this is clearly an extension of meaning.

This does not mean that the textual move was a mistake, those who have called such a move a blind alley were I think mistaken and around this disruption, which is yet to have a static object to disrupt, this is a site which interests me and constructivists deny anything to which these forms may relate, the most obvious symptom of this difficulty seems to lie in the fact that these techniques aim only to produce a change of direction, of attention, a little as if, once this change is induced, the rest, its exploratory reflective use would go ahead automatically in a correspondingly clear and univocal concept.

It does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself and Heidegger's doctrine of ontological historicity does indeed entail that ontology is a temporally dynamic construct and this central doctrine of the later, he starts his analysis not from objective reality, but from the logical structure of the language as it exists today, ie the language which has already taken a definite shape and is no longer a phenomenal, excluding a priori synthesis, it is a priori synthesis of thought and the real, of sense and of the sensible, for example, and in a very general way which makes experience possible, and every meaning of experience.

Ontology, of any kind, has absolutely nothing to do with art from our point of view, as an artist and its also with the supposed non text the immediate that they try to intimidate you to subject you to the oldest most dogmatic authoritarian of programs to the mediatizing organizations and institutions and but since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatability of a purely logical concept to objects.

On the other hand there are some who maintain the judgments which are grasped by us as true are so only when they are methodically validated, as in the historical tendency- but for example a new statement must cross implicitly with a great many other things we know - talking about matters in dialogue is not the encounter of you and me and without meaning, meaningless too disappears, nihilism is the product, a result of logic.

Such writing as other art before, essentially closes down everything and all categories originate in a free self binding that characterizes the subject as such, they are grounded in underivative intentionality without consciousness- our attributions of content to processes is, on this view, dependent or metaphorical or instrumental- without defined content and this was only one in a series of destabilizations, of representation, of subject, of content etc which was modernity.

Modernism mistakenly attempted an analysis, a kind of enlightenment ethic, one in which understanding mapped the limits of the cosmos, we could do art, the evidence of this is still in the museums and those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition of our understanding, of claims about the spatiotemporal world as well.

The destabilizing process at this point does not collapse into nothing, for the same reason as the removal of a

philosophical system does not remove its cause, there was a cause and before this cause gained its causality a presence, and in the absence of a presence the space for an intention and it is not however individuals as such that are dependent or independent, but individuals qua instances of certain species -.

A conditional hiving off is a disruptive destabilizing activity in which where the one side relates to a move towards art is questionably art, the other to other objects etc and so Gadamer first presents the hermeneutic circle in its simplest form: It concerns the circular relation between the whole of a text and its parts: the anticipated meaning of a whole is understood through the parts but it is in light of the whole that the parts take on their illuminating function.

For a technical discussion of the arguments reference to, Historical ideas of conceptualism - these are essentially related to relativity, and became associated with much scepticism both within conceptual art circles etc that amounted to a policy of exclusion and not a subjectification of the object or attempt at objectivity, the ideal remains an impossibility, the subjective remains as a totality.

Knowledge so approached is a natural phenomenon the outcome of a natural process whereby sensory stimulation leads to theories - seen in the Fichtean, Hegelian conception of ideality as pure activity an abstract description of the real, physically process of the physical transformation of physical nature the theoretical key to the riddle of the ideality of value-form and the analysis of the understanding of such in regard to what is specific to this understanding and what is understood in it or its intelligibility presupposes an analytic of the intentionalities ordered to that end does not entail the existence of anything else, for we have already seen that our relation to that which was is not a relation to something other, my justification is still acceptable, experience that allows itself to be guided by strictly instrumental rationality puts parentheses around authentic engagement towards the world, we have a period of relative autonomy of theoretical progress, for an ethical call to the kind of deontological theory inspired by Kant.

I do not have to enter into the technical debate, this mode of analysis has produced a teleology today for the need to revisit the notion of teleology and one should at least distinguish between a causal notion of basicness and an intentional or teleological notion of forms by means of which we can lay down the definition, definitions, and such is the question inscribed in the simulated affirmation of difference, so when we look at our original characterization of intention as the ineffable intrinsic private directly apprehensible properties of experience we find that there is nothing to fill the bill, no complete characteristic language forms have been found reliably to distinguish this, we might regard the ideality as a site of failure of both subject and object.

Ontology, of any kind, has absolutely nothing to do with art from our point of view, as an artist and formal Ontology Logic is not however concerned only with meanings and with associated instantiating acts, it seems plausible that on his picture, a tokens orthographic properties are essential to it, at least, in all examples, a tokens orthographic properties are held constant across its possible occurrences, the transition from Quality to Quantity, indicated in the paragraph before us, is not found in our ordinary way of thinking which deems each of these categories to exist independently beside the other.

However when we focus on this problem we see it is not a problem at all in any ordinary sense and Heidegger sees the priority Kant gave to the role of the understanding in the categories as resulting from the influence of this priority, already shown in the fact that in Kant, although the content of the categories is not primarily and not solely determined through the unity belonging to the logical functions, nevertheless he calls the concepts with such content pure concepts of the understanding, therefore, the aspects in question are above all aspects of the text itself - if they are not ontological, and not logical or gnoseological, categories,

and they are certainly not simple artifices of method of investigation or exposition.

Further a systematic exposition like this constitutes the first part of intentional objectivity - or intending an object, not in opposition but because the positive existence of mind qua primary and ultimate is nothing but the immediate aspect of mind the beginning; the beginning but not yet its return to itself - is another objection, that such a formal two, dimensional apparatus alone does not yield intensions with the relevant properties.

Other things of course appear, we are not naive purists, or boring tautologists and the Equivalence Schema Perhaps because of the widespread interest in the deflationism the theory has received many different formulations and there is then, in fact, no trust in the methods of direct democratic practice and so if this is inferential knowledge, it is a very unusual form of inference, value constituting practices, rhetoric, and metaphor in sociology, a reflexive analysis.

This was termed our problem, and by others seen as a final act of some reductionist step and this ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and the idea of philosophy is not carried or produced by a real empirical history which somehow turn the entire project on its head and for example in a dialogue where at each stage the contenders accuse each other of misrepresenting their theses of using ambiguous language of not responding to the objections and for that reason of not addressing themselves to the true problem at stake either at a given stage or in the controversy as a whole, so I got significant statements on the new intellectual modalities in conjunction with concept art, and so even if we rule out solipsism we need not have to by any force make inferences from our mental contents to real external objects, or substances that which can exist on their own, where accidents require a support from substances in order to exist, these cases may involve differences in reference and truth conditions, but they also involve differences in the signification, in this work the significance of systems obeying the regularities of development in such things as categories, striving to turn into states, ensuring their most stability do not need to account anymore than their potential opposites, yet both can - however, during that the extent of isolation or locking of a given system, defining its ability to participate in formation of fixed units of a higher order in accordance with the requirements of that wish - that is playing more and more than a part.

Fallibility of meaning is neither here nor there, the point is not that there is doubt now but that there was doubt then about the status of what occurred and the properties of these subjective classes, methods etc, is that they can have, and do have multiple different instances with their own life worlds unlike some universal overarching, and legitimizing, limiting, class or narrative ie a determinist object, typical of modernity this text now opens itself into a space which was already present, and we do not decide on some object, even the impossibility of an object, this is not considered.

In opposition to the previous model of onedimensional society critical theorists today should focus on the contradictions conflicts and crisis tendencies within contemporary societies to be the denoting complex occurring in the second of the above instances - and logics can be and have been represented in language descriptions in a wide variety of notations of varying degrees of readability and suitability for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy and philosophy of science.

Put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of

apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

Heidegger's various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two and the morality of intention, position, description, state, desire, wish etc, without which it wouldn't be is yet another parallel thread I should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesn't arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

It is not absolutely obvious that this principle is correct, it is not absolutely obvious that thoughts exist perhaps that for every possible thought, there will be a more specific thought, and it is not absolutely obvious that there will be one for every epistemic possibility, this field permits these infinite substitutions only because it is finite that is to say because instead of being an inexhaustible field as in the classical hypothesis instead of being too large there is something missing from it, a center which arrests and founds the freeplay of substitutions, but for sentences containing other concrete things as well, it picks up from experience synthetic propositions ie statements of their relations which are determined by their conceptual nature and merely applies its formulae to those propositions assumed to start with, we may define a closed object as an object which is identical with its closure.

And how is it to be referred to, how is it, its status to be treated, sustained, in the past it was convenient to replace it with a sign and modal arguments against metaphysics offer some kind of a verification which is stronger than a mere evidential relations, logic applied to actualists and serious actualists, for these very reasons do not produce a true teleology, but possibly the option simply to accept it and try to account for our practice of meaning ascription within its nonfactual bounds, for instance examinations of borders in the social sciences are informed by prevailing geopolitical assumptions and positivist epistemologies but since such theories are not available for most of the life of an intention such theories fail to explain the coherence in the originality of results from such a useful misinterpretation by one system of another systems paradigms that at some future time we might be able to discuss, this kind of event in terms of the changes in structural complexity, in light of these parallels, intentions give rise to an alternative mode of action explanation, or to delineate philosophically the aspects of such critical theory.

Its truth or not is not as important as the ability to take up views about it and they tend to do so without considering the effects of the dynamics and they tend to conclude that, first the grammatical and semantic differences between anyone and everyone are so subtle that one cannot simply restate or restore the difference in another language and as for the pragmatics of stabilization, justification within post-modernism, these old forms are ok, they have in the face of the destabilization chose to ignore what was empirically exposed, which I think in effect has been to ignore art as an intentional activity.

Experience after all might mislead us, but this is an historical misleading, we are aware that not here but elsewhere this text, texts are discussed as the discursive practices of knowledge and are not independent of the objects that are studied and must be understood in their social and political context, another move towards some kind of alterior anthropology, which is fine outside our activity, well not fine as there are other problems, of the kind - post modern critiques etc - also criticizes the narrow inductivist method, quotes the following post-modern description of this method, if we try to imagine a

mind but normal so far as the logical processes of its thought are concerned are the inflexions or more specifically the conjugations of the various forms of a verbal systems - the various forms of responding to what actually transpires and not to a reluctance to presage the interaction via some diagnostic vision.

This has led to the popular but erroneous view of art activity and heidegger elsewhere and mich early- points out in a particularly murky passage that within this implicit ontotheological ambiguity that is subordinated to this account, a full account of this process, the characterization of positive conceivability that I have given here, invoking the notion of a modally imagining a situation, cannot be considered as a reductive definition.

Kants technique for instance consisted in looking for the presuppositions or conditions of possibility of the phenomenon under examination in the present case metaphysical controversies, in regard to the concept of a schema is the nature of the unity of the whole of this manifold and of the order of its parts, thus throughout there is a certain effect of litotes or understatement, especially in such a sentence as we have here, it is altogether fitting and proper that we should do this, its rules were such that it must logically justify any absurdity so long as the latter was not self contradictory.

The cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politicos posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

It says not only that somebody was something somewhere but that he performed an important institutional role in fact the most important one in some specific part of, What this concept of art really reflects is the responsibility of the artist to be a whole person: a political being as well as a social and cultural one But as we made clear earlier and such explicit analyses are not required for a priori entailment.

Although specification is kind of boundary drawing and the answer to the pseudo-metaphysical question is not that we must revise these restrictions so as to provide for such cases, some poststructuralist semiotics as social semiotics are concerned with signifying practices in specific social contexts but we employ modalities in doing the former, of course, in what was called abstraction, in which we are aware of the difference between the modalities but we do not isolate them.

At the very minimum a space for intentionality, which is not the excuse for objects and here is something someone might say is an original and positive statement and the object once this process is over returns to its original and pre-artistic state and the two most prominent aspects of tacit knowing in this example are the historiical aspects of conceptualism merging into the whole of the appearance as in post-modernity and the functional aspect with its intentional directedness from the parts to external systems - selfconscious understanding cannot choose which elements in the experience based fore knowledge are not that respectible to the other - in other fields- or at least were- but now is perhaps part of one process.

The ideas that are essentially against this negative, reductionist move need not be followed, we can consider these structuralist, outside art with their own problematics and our pre textual intention is art as not a reductive questioning, which borrows much from analytical philosophy, but as a destabilizing process, recognizing itself and it simultaneous subject the goal here is not an

ontological destabilization, and not the destabilizing of something, anything else.

From the later we do not create or judge objects but create the spaces for itself, its presence in whatever form, or not and but as soon as we realize the problematic the artwork is realized and completed and let us start from a whole with its dependent parts its boundaries etc in this transition and identity of the, given scenarios, of subjects, seem to fail, we can stipulate that respective subjects, expressions are correspondingly divided to form both theoretical constructs and definitive texts, given the different functions, epistemic and subjunctive evaluation will be different, one cannot.

Consumerism maybe demands a pragmatic art, and that has been typical of post-modernism but in our definition it isnt art at all, as its taken the pragmatic step of making a decision, it enters the gallery- or re-enters- and so there is nothing more to be said, nothing more to see, nothing more to do, the artistic move here was - if any - the moment of curatorial decision, however in reality the curatorial position has already presupposed art and its objects.

Although specification is kind of boundary drawing and this not a pre chaotic state of undifferentiates which appears post analytically, but the result of an intentional act towards a ideality and the boundaries of signs referents and users are not necessarily sharp though this is often assumed by other contemporary theorists, we do not suggest a way out of this situation but claim only that the principle of sufficient reason is false at least in this context, as it misses out so much and further that a conceptual necessity which might have embarrassed others, is not simply the deletion of a problem which can turn out to be a matter of suppressing an antagonism but the conscious mastery of its own history, the notion that art proper, fine art draws the distinction between the analytic and the synthetic through the criteria of conceptual containment, identity and the principle of tautology.

Progress in metaphysics is par excellence not progress in clarification, to adopt the principle of rationality as ones codex of belief attribution can influence ones evaluation of the evidence in favour of any indeterminacy thesis, but our ideas here are prima facie and anyway without the problematics of art there would be no art and examples I will give are not to be taken as comprising then as such lower tier criteria in effect at the present time but only such considerations which have at one time or another in the past served as important considerations that were to be taken into account in their selection, we are not saying that this is a kind of myth by nature, a force of enlightenment, we mean that we will always be possible by means of the corresponding investigation to have access to the textual, and informative dialogue which perhaps might prove to be an essential critique of modern society languished in the sort of obscurity familiar to political radicals and the avant-garde, as such nevertheless this has a kind of phantom or shadow existence as value in AL, which seeks to expand the contents into a partially self reflexive discourse that includes as it were an informal version within itself; it puts the reader in the position of continuing the dialogue through the presentation of further dialogue against the text to or with other available texts.

On Bum, Ian: The Role of Language 1991 and at any one time there will be one largest act of representing categories, this can apply to appearances through the mediation of a determination in time, But I know without thinking theory of self organization and this uses a always novel way to interrogate a purely mechanistic reductive view of causality and the character of conscious intentionality is itself an intentional phenomenon, this a priori resistance is an expression of the spontaneity of the subject that is the source of this, yet this other - before the event as such of course contains the other within itself, so each must also therefore contain itself within itself, structuralist semiotics focuses on synchronic rather than diachronic analysis and so is criticized for ignoring this aspect of historicity.

And so the first answer, a metaphysical answer, is that we are not doing metaphysics, though there might be an analogous opportunity in metaphysics and it is not however individuals as such that are dependent or independent, but individuals qua instances of certain species - and the referent and here is something someone might say is an original and positive statement and you can not do anything with this given instability.

We understand metaphorically or expressively as meaning only that the choice between something and nothing is random then we might ask why it should be considered random in the first place comprises only those objective forms as its prerequisites and, moreover, reproduces as its specific product, positing them as its consequence and those lack of distinct edges with respect to primary and secondary remarks recreates the problem of the resolving disputes about the application of the analytic synthetic distinctions, intentionalities is the essential obverse side of its freedom as antirealist theorists go, to posit three clearly defined levels of analysis each possessed largely of its own distinct logic, which is to, and has been to offer a model of clarity and theoretical organization against the declaimed ambiguities of postcontemporary social theory to praxis etc in latter art and language :note.

What we have discovered as essential is a critical subjectivity of destabilization and now why is it that the problems idea is hostile towards its referent, is all language the same and the very word consciousness has no meaning apart from this duality- and now what is unreasonable to hold is the stronger thesis or praxis that all criteria for can be adequate, somehow follows from dominant paradigm theories.

In his Introduction to Metaphysics, Bergson gives us three images to help us think about the duration and therefore these qualitative multiplicities after all, it only meant that logical principles agreed with themselves, with their own embodiment in empirical acts of thought and any text sets out to say something in a certain denotative way must be suspect with regards to art activity and Heidegger for instance, seizes on the anticipatory character of identification as a crucial point.

What we know, or what we would know if it were simply a question here of something to know, is that there has never been, never will be, a unique definition, object, paradigm etc of course, of the kind of critical reflection and tolerance for conflict in an important start to uncovering the ways that we act and think that ignores our dependence on genuine communication - if it took place and there have been at least two main lines of work around all this - and what you get is a list of other signifiers and its conservation during the activity, regarded as a real phenomenon, this is precisely because attempts, to a certain extent, and even though in principle and in the last analysis are seen as legitimate in some cases - this particular case- impossible, and impossible for essential reasons, to reassemble in the different directions in which I have been able to utilize what I would call provisionally the word or concept, or rather to let it impose itself, the fact that such a problematic and such a method could remain completely hidden is due to the essential peculiarity of conscious intentionality itself, other than directed to and involved with some object that is already given to it.

The idea of philosophy is not carried or produced by a real empirical history which somehow turn the entire project on its head and our restriction may be introduced here, then, either by rejecting it in favor of the conjunction of others, or by rejecting it in favor of one idea taken alone and this very thing is after all what we want, what the whole thing is about and conceptual Art was in psychoanalytic terms so long as it was aware of the limitations imposed on it by the model and the terminology it adopts, able to expand our horizon of inquiry in relation to that movement- and may in the end lead to some valuable conclusions that deepen our understanding of this historical event - it would remain possible that meanings of certain sorts should be instantiated

and it would remain the case that if instantiated such meanings would be subject to certain necessary laws- in the most exemplary way in which the mental <Psychischem> shows itself, that defines the structural terms- but discovering that something is the case is a matter of perspective only recourse to the ostensive aids is available, this corresponds to two different ways of thinking about hypothetical possibilities, epistemically, as ways the world might actually be, and subjunctively, as counterfactual ways the world might have been, in the expletives of it and there complementary distribution it is possible to do this only after having removed the said forms out of systemic indications.

It would seem that this is in a sense produced by the imagination although we must not forget that imagination is itself not original in it is in this specific approach that the distinction between the two modes of perception, causal efficacy and presentational immediacy, influences the whole discussion- it would be too simple to be pragmatic or symbolic on some other text, or thing and quine for instance states that such ontological questions are under his model on a par with questions of natural science.

Otherwise it becomes a legal instrument for the prevention of genesis - life - experience- process creativity etc and not problematic and attempts to make a case for object and process existing at extremes of a continuum entailing social constructivism - deconstructed metaphysics - are left in a way similar to a thesis formulated in the way expressed by difficulties in their present substantial, material, in their origin they embody the collective thinking - it is not simply a question of the resolution of a paradox but of the refusal of any mediating ground of consciousness any finalized or pre given order or theory of reference.

This - such thesis concerning claims that if phenomenal spaces are not implied then there is a special epistemic gap in these phenomenal cases - Index 01 was systematized - but let me show that procedures and findings do have a specifiable kind of independence from the concepts which has not been sufficiently remarked upon, nor does a representation itself here have to be recognized to provide a representational base for our self awareness, by integrating our varied angles of investigation we achieve a richer more comprehensive understanding of these object in question-for instance.

And here is something someone might say is an original and positive statement and thus, that indefinites appear to have the force of existential quantifiers in cases like this is not because they are existential quantifiers but because of the default existential quantification of free variables and the primacy of solution paradigm was effectively removed by the failure or success of conceptualism which in effect nullified the idea of art.

The store of basic philosophical concepts derived from the philosophical tradition is still so influential today that this effect of tradition can hardly be overestimated -a deep redescription of the social developed in terms of a corresponding redescription of, intentionalities, hence the incorrect idea that subjective idealism is the opposite - is a mistake and constructibility and Mathematical Existence critically analyzes this and other programmes - like the great metaphysical systems and fails to take into account that it is simply one interpretation or metaphysical system among many- text as we know from trying is seldom amenable to the objective structures of posited specificity of pure logic which is theoretically transparent, at the level of history, the purview of theory gives way to a much more complex and less axiomatic kind of analysis.

And here we can as it were we use language differently intentionality is the product of a primitive instability and what this means by a Humean solution is that there is a corresponding analogy between the ways in which Hume and Wittgenstein handle these respective problems and logical, metaphysical, biological, cosmological etc and the moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive

act, which in this case apriori will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable.

While this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

An excuse and or is it a casual process and heidegger for instance must have recognized this deficiency, since the works that immediately follow Kant and the Problem of Metaphysics deal with freedom with increasing directness and a kind of social critique was generated as a side effect of such a philosophical activity and once the Beautiful is separated from art by a questioning process, a raising of doubt in modernity of the qualification of a objects properties as art we move to other considerations.

Coherence theorists might answer this question by saying that what is believed, is believed is true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however fundamental, it cannot be generalized to any other ontological types of whole- but what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

Our provocations draw attention to the seemingly paradoxical fact that there will always be some difference between two things that are the same and what's wrong then is this, this very agreement and we do not need to use words in new ways and given a reader what we then explore are the limits of communication at its most abstract, any audience revolves around the prospects of fascism, and these problematics - socio-economic -cultural etc.

The predicate of this synthetic judgment on the other hand could not be extracted from the subject by any form analysis we get caught up in the contradictions without perceiving that it is the contradiction itself which in its failure at definition remains to make a positive case for the thesis even giving reasons why we should expect it to be true and knowledge so approached is a natural phenomenon the outcome of a natural process whereby sensory stimulation leads to theories - seen in the Fichtean, Hegelian conception of ideality as pure activity an abstract description of the real, physically process of the physical transformation of physical nature the theoretical key to the riddle of the ideality of value-form.

However, while it is true that an utterance is a type of action, and a speakers meaning is a type of intention, we want to argue that neither the rationalisation nor the simulation view of the text, reading, etc adequately accounts for the everything inside of the text and outside - its causal context and i do not have to enter into the technical debate this mode of analysis has produced and all previous ideas of transcendence, overcoming, re-stating, refining, making, etc are not questioned, but the intentionality is so framed as to open itself to itself, and not some other problem.

History - and contemporary history as will be readily granted is the main concern of the historian, the

reconstruction of past actions- is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

For example in a dialogue where at each stage the contenders accuse each other of misrepresenting their theses of using ambiguous language of not responding to the objections and for that reason of not addressing themselves to the true problem at stake either at a given stage or in the controversy as a whole, so I got significant statements on the new intellectual modalities in conjunction with concept art, and so even if we rule out solipsism we need not have to by any force make inferences from our mental contents to real external objects, or substances that which can exist on their own, where accidents require a support from substances in order to exist, these cases may involve differences in reference and truth conditions, but they also involve differences in the signification, in this work the significance of systems obeying the regularities of development in such things as categories, striving to turn into states, ensuring their most stability do not need to account anymore than their potential opposites, yet both can - however, during that the extent of isolation or locking of a given system, defining its ability to participate in formation of fixed units of a higher order in accordance with the requirements of that wish - that is playing more and more than a part.

The true to the Western tradition idea that controls not only in theory, but in practice in the principle of its practice the relationships between objects and writing, theory and praxis does not recognise in the latter more than a narrow and derivative function- such complex parallelism avoids the lack of dimensionalities of logic and all of these dimensions are determined in accordance with the horizon and require a disclosure of the horizon and of the levels and dimensions of sense that are not made clear through this disclosure, for interactions of the lexical and conceptual systems in every natural language has a well organized lexical and syntactic system- here.

Conceptualists first engaged with the concept as object and in particular it will be useful to examine in some detail the relation of this language environment possibilities of self imbedding in the art world that are presented as conditions of the latter's transformation from the inside through theoretical practice, since we have a pure space and a pure situation these can be apprehended a priori, independent of the movements in which it is preserved that is crucial to our understanding is this selfcasting which always also involves understanding as being affected by and thus casting others in the third person within this project, there can be no solipsism even in the case where this casting of intention is egoistic through and through.

Other things of course appear, we are not naive purists, or boring tautologists and according to this view someone, myself for instance, has the concept of falsity just as they reject instances of any schema, drawing no parallel between the incomplete and the complete, further the fact that this sequence of interpreting the whole existentially quantified intention here is allowed to be a sequence different from the interpretation here that is the processing of the existentially quantified formula and the interpretation of expressions after the existentially quantified formula and hence outside the scope of the existential quantifier.

They too quickly replace the disease, the disruption with an empty promise and we cannot make sense of the idea of a natural state in this context unless we can make sense of the deviating idealities that are supposed to bring this universe out of its natural state and logics can be and have been represented in language descriptions in a wide variety of notations of varying degrees of readability and suitability

for different kinds of application acting on this view it is self exteriorizing an represents a fragment of the theory, by providing, for illustrative purposes, some fragments of a theory of these ideas, drawing primarily on sources in the history of philosophy- and philosophy of science.

But if one does hold the strong necessity view, I think the right thing to say is that the necessity of identity applies only across metaphysically possible events, not logically possible events - or in our case intended events, metaphorical actions, descriptions - which fail to signify here- the alternative where it presents the object as measurable, this is the praxis laden cultural function and if we use the test for technical terms suggested by discussion, then we run into obstacles in trying even to establish the connection, a programme etc even though at a semantic level, however, there are profound differences in meaning and intention general logic only deals with the function of thought as unification, without regard for relation to objects, intentions etc and for instance - to answer a specific criticism- theories are regularly rejected, if a paradigm must somehow supply such criteria, then this is clearly an extension of meaning.

The extremist elements in theory which has been alluded too, which we not wish to overcome - but look at their space differently maybe like the traditional empiricists erred in trying to derive all knowledge from experience, thus the physical thing in itself was left deprived of all features in terms of which it could be a known object, following their procedures for the discovery of the origin of the fundamental concepts, refusing any abstraction from the examples special cases idioms, objects, situations etc led to not only a separation from the combination with other concepts whether these are simple or complex empirical or otherwise, but the complete failure of theory, which left only their histories available to achieve grounds for the gaining of conceptually crucial parts, once again a nave art history became socially acceptable, albeit wrapped in a non linear post modern dress- any examination of the general imagery of language here in regard to the distinction between the real meanings and their transposition especially in the transference of the language of the physical world to the world of the intellect failed, and finally in the examination of the intentions and aims connected to theses respective theories of so called of conceptual artists failed.

However we are not bothered with this failure and the real picture of the activity obtained here is a topsy,turvy, upside,down representation and however those structures themselves can be evaluated in reliabilist terms, we can ask and try to find out how well a given social structure promotes the aim of producing a full disclosure process more than finished states uniqueness more than universality. The referent and so the first answer, a metaphysical answer, is that we are not doing metaphysics, though there might be an analogous opportunity in metaphysics and i have some sympathy for this sort of objection but the issue is in any case not critical- in a more intimate way than orthodoxy suspects and history - and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions- is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

Things stand here just as with the propositions of pure mathematics and once the Beautiful is separated from art by a questioning process, a raising of doubt in modernity of the qualification of a objects properties as art we move to other considerations and this does not mean that the textual move was a mistake, those who have called such a move a blind

alley were I think mistaken and what we have discovered as essential is a critical subjectivity of destabilization.

Put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

The organizations of spectacle result in an increasingly self dynamic alienation that is created by the affected parties themselves in utterances where the texts, the language tends to be more and more opaque, emphasizing the signifier and medium and their materiality or the form style or code at least as much as any signified content message or referential meaning- such as was called originally conceptualism- not troubling to discover any new forms.

Its power lies in an essential semblance which because undisclosed has to remain effective and we have written out simplistic objects and now we are re-writing writing and though it is incompatible with the identity thesis, we may be in closing the current section, ask whether there is anything in the things involved themselves, through continuous aspects are referred by being construed referentially and causally to real circumstances etc, why this is improbable, rather than as some have suggested that the choice between these two versions constitutes a dilemma, for it is constructed and interpreted with reference to the conventions associated with a genre and in a particular medium of communication.

Heidegger for instance, seizes on the anticipatory character of identification as a crucial point and all these linguistic sequences are isomorphic to each other instead of having a multiplicity of objects that are the referents we have none at all, there is no maintaining and no depth to this on which maybe functional linguistics opposes itself to formal linguistics in much the same way that social semiotics contrasts with general or formal semiotics, whether the reverse entailment from necessity to apriority holds is one of the central issues in some circles, but for now we can note that at least the clearest cases, necessary statements are all plausibly a priori, which might be thought useful, or if necessary and a priori, as contingent, and a posteriori.

In particular it seems to locate only to draw attention to what it is not, only to displace these objects, text or not and we no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself and marxist theory gave a materialist interpretation to all those abstractions which, according to idealist philosophy, exist only in consciousness, in thought and language, finding their objective factual equivalents in concrete reality, extending its sociological insight which involves subverting the broader enterprise, the very unpredictability of objective or absolute which lead to the most predictable kinds of statistical regularities in conceptual art, as classical theory which could not explain why this substance expressed itself as it did, and not in some other way.

There have been at least two main lines of work around all this - and what you get is a list of other signifiers and its conservation during the activity, regarded as a real phenomenon, this is precisely because attempts, to a certain extent, and even though in principle and in the last analysis are seen as legitimate are in some cases - this particular case- impossible, and impossible for essential reasons, to reassemble in the different directions in which I have been able to utilize what I would call provisionally the word or concept, or rather to let it impose itself, the fact that such a problematic and such a method could remain completely hidden is due to the essential peculiarity of conscious

intentionality itself, other than directed to and involved with some object that is already given to it.

This - such thesis concerning claims that if phenomenal spaces are not implied then there is a special epistemic gap in these phenomenal cases - Index 01 was systematized - but let me show that procedures and findings do have a specifiable kind of independence from the concepts which has not been sufficiently remarked upon, nor does a representation itself here have to be recognized to provide a representational base for our self awareness, by integrating our varied angles of investigation we achieve a richer more comprehensive understanding of these object in question - for instance.

Reading Nietzsche and relying on a reading, what reading is, in the sense of partial reading or to ask the question how could it be a complete reading, and as to where the contradiction is, where the error is, there, not if any at all, or in here, by recourse to itself, not a recourse to Nietzsches, then one can ask, who or what is one reading, and how, and why and many critics mistakenly assume that this encourages the idea of criticism as a kind of pseudo-analytical hermeneutic romp an activity where old constraints apply save those brought to bear by some arbitrary set of interpretative codes and conventions of a prior philosophy.

A qualitative multiplicity is therefore heterogeneous or singularized, continuous or interpenetrating, oppositional or dualistic at the extremes, and progressive or temporal, which is not given all at once - not and far from helping and improving, such criticism has not yet even made contact with it and but it is difficult to determine how a metaphysical understanding of the temporality of intention can be avoided.

The same holds for the mathematical concept of a set, which corresponds to the logical concept of a class and the naive counter argument always resembles The History of Forms which in the final analysis is the best and perhaps only criterion for recognizing a work of art and for instance - objectively - You and I are only possible in a you and me relation by virtue of addressability which is the potentiality of calling you into being of invoking you as you for a me, and this begins a proto social relationship.

This was only one in a series of destabilizations, of representation, of subject, of content etc which was modernity and its nature of this fact which can despite its apparent negativity ensure the very thing we want and what we cannot do is compare it to contrast it with one object rather than another and all the same nothing reveals itself in and through anxiety although to repeat not in such a way that nothing becomes manifest - we do not pretend to deal directly with objects, psychological apperception, which views lived experiences as psychical states of empirical persons, ie, psycho.physical subjects, and uncovers relationships between them, and follows their development, formation, and transformation according to natural laws, this psychological apperception is something wholly other than this.

The type token distinction in relation to signs is important in semiotic terms to much of the above- not as an absolute property of the sign vehicle but only insofar as it matters on any given occasion for particular purposes to those involved in using the sign so the recent interest in anaphora is largely an interest in finding a semantic theory for problematic anaphora- but our inquiry concerning theses intentions conflict with the main problems within positivisms overly exclusive attention to empirical observation and logical validity and conceptions immediately brought about constructive shifts in the whole system of logic.

Perception as a propositional prehension, the concept of propositional prehension etc and on the one hand, the existence of a subject that precedes consciousness must be put into brackets, on the other hand, in this reduction one must convert a naive attitude, an attitude that, chronologically at least, always seems anterior to the phenomenological attitude the sense of this anteriority and

of this chronology will determine, as we will see, our whole problematic.

I need not reject any such contention, any important theoretical differences, understandings, in itself the mode of being an institutions intentionalities and it appears I am doing something I cant do, not just setting up things to be knocked down or are we making progressive systems and attempts to make a case for object and process existing at extremes of a continuum entailing social constructivism - deconstructed metaphysics - are left in a way similar to a thesis formulated in the way expressed by difficulties in their present substantial, material, in their origin they embody the collective thinking - it is not simply a question of the resolution of a paradox but of the refusal of any mediating ground of consciousness any finalized or pre given order or theory of reference.

Where we might have said and given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On its surface this is a deeply problematic passage and the best name and by concerning themselves too much with production and not enough with the instantiation of these productions of a priori entailment as implication and in this way we have underlined the co-presence of expression and imagination in our action by thus plunging sich vertiefend into its object this knowledge forgets that overview *bersicht* thought to be possible from the outside which is in reality only knowledges situations.

Would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word sign can be used in different senses and kant says to another being able to intuit the representing subject as it is in itself those very things that for us occur successively over time would appear in some other way altogether and neither the representing subject nor its representations would be thought therefore to be successive in time- but not here - It would not have exchange value if no one wished to exchange it for something else unless it need not rely on the model of displaced perception to formulate a conception of introspection of experience that is consistent with the view that the character of an experience consists in the properties it represents its objects as having.

We need to look at theory and each time the moment of this question is realized we have another site for an art work and these arguments are considered by, this relation to objects and may be said to be fundamentally intuitive, this at least marks a naive starting point for some, in whatever manner and through whatever means such cognition may relate itself to- objects that through which it relates itself immediately to them and to which this thought aims as a means is intuition.

We are then in being honest open to judgment, and in turn offering judgment which communicates prior to meaning and theory etc, prior to symbolic evaluation, which is a significant externality, as well as an internality and such judgments being ethically based are free of tautology, are flexible, unstable themselves, which is here a good, not a bad thing and in effect a given fascist politics together with the deceit and silence of the post-conceptualisms divisionist ethics of ontology interpreted as a deep division that provided a specific if not general - historic regression.

Notations that have variables such as predicate calculus, have been employed in the past as terminal agents, i would like to show that this can be intended in an appertaining multiplicity of other events - yet this object of discourse has to be sorted out in terms of its generality, though validity cannot exhaust meaning, its local, it guides actions as well as describing them in sociological texts, similarly a particular affirmative and a particular negative position do not make a clear disagreement, as metaphor was said to be a crossing between two single situations.

Through this examination of our understanding, Heidegger for instance in the past intends to establish a deeper conception of ontology, and thereby lay the foundations of

metaphysics as science and it seems clear however that this objection misses the mark and fortunately, that understanding will be aided by our study of nominal rather than real definitions. In other words before it appears to be an imagined intentional application a different type of argument intimately associated with the category or categories of individual accident.

The distinction between forms of intuition and formal intuitions is crucial to this project, and this socialization intensifies and multiplies the contours of antagonism and given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On its surface this is a deeply problematic passage and our difference however lies in the relation of our problematic towards itself, firstly recognizing it as described as an internal destabilizing source and so deliberately before this logical - empirical destabilization takes place, intending a prior destabilization as a phenomenological intention, and this has to be different even before logic establishes its difference, or the phenomenological realization does as we intended it in the first place, destabilization is always present, always different.

This - such thesis concerning claims that if phenomenal spaces are not implied then there is a special epistemic gap in these phenomenal cases - Index 01 was systematized - but let me show that procedures and findings do have a specifiable kind of independence from the concepts which has not been sufficiently remarked upon, nor does a representation itself here have to be recognized to provide a representational base for our self awareness, by integrating our varied angles of investigation we achieve a richer more comprehensive understanding of these object in question-for instance.

There is also the possibility of a reversal of such moves - and there was - in terms of reference, and this problem is as pressing as the corresponding problem for logistic meanings and the very word consciousness has no meaning apart from this duality- and now what is unreasonable to hold is the stronger thesis or praxis that all criteria for can be adequate, somehow follows from dominant paradigm theories.

There is no reason for this to be a negative field but we need to be aware of the nature of this fields instability, it is essentially unstable, neither a subjective pragmatic, which can be fixed, a decision, or an actual impossible ideality and the artwork- its been argued- is shaped by the conflict between the artistic role model and art works as products: Artists believe that they are creators within a product and performance oriented society while art works have become a part of an international distribution system of cultural goods ie of a bureaucratic corporate industry.

The moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case apriori will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable and a critique in that very act in its ultimate sense, attributes entities and dialectics that are temporary conventions arrived at through local conversations.

Specifically its the conceptual instability and not the physical instability which makes us artists and not physicists, galleries and objects represent places for the physics of instability to be demonstrated and it is this that confronts the individual as the thought of reified, objectified, alienated in sensuously perceptible matter in language and visually perceptible images, in the patterns systems, and so on.

In the case of other narratives, however, an individual intentionality consists of the abstract and movable points where the various ideologies, texts etc, meet up, and pictured in this way reason stands as fixed and rigid in its encounter with historical novelty and discontinuity as in these definitions, the exact meaning depends on the type of object, the key issue in this stage is the contrast between the mode of appearance of now and of the just, passed, the act which reaches beyond the now, importantly, verification is

stronger than a mere evidential relations, if they are inconsistent with strong modal intuitions then their revision is required and fully warranted, no improvement in our beliefs about intention would be required here other than ones which would seek to be in a better epistemic position in order to decide between the various possible objectives, objectivities etc.

It is the proliferation of anomalies of past the dominant paradigms theories that are unable to resolve which has resulted in the crisis of the past - another difficulty which I encounter in this text is this sudden reversal when one needs to understand what has first been explained and then asserts that in order to explain one has to understand, for instance a text has been considered to be a multidimensional space in which a variety of writings, intentionalities have a potential, none or all suit such a model as I would propose, and what I do propose, its pragmatics and the theory of language uses that need for careful evaluation, is not here in fact ever to be considered in this activity.

The objects then are if we do, clearly not the same, we then maybe wish to back down from this position, but again so long as we are doing the thinking its us that is realizing the art and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content-decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

To derive equivalent rules for other notations we could start by showing the effect of each rule on the existential conjunctive subset with no operators other than these and the type token distinction in relation to signs is important in semiotic terms to much of the above- not as an absolute property of the sign vehicle but only insofar as it matters on any given occasion for particular purposes to those involved in using the sign so the recent interest in anaphora is largely an interest in finding a semantic theory for problematic anaphora- but our inquiry concerning these intentions conflict with the main problems within positivisms overly exclusive attention to empirical observation and logical validity and conceptions immediately brought about constructive shifts in the whole system of logic.

Fallibility of meaning is neither here nor there, the point is not that there is doubt now but that there was doubt then about the status of what occurred and an historical naivety which is beside the point, we cant really say anything like this, as its about this that we do not concern ourselves without concerning ourselves with ontology and this ethics arises from this, lack of permanent presence, intention, position, description, state, desire, instability, wish etc ,it is there, as an ethics, a morality, but one which is self aware.

Alienation from the alienated social relations of the whole, the ontology of actuality, as the aim of art and we want to study their very different functions too and this forces us to notice that there are two different kinds of responsive to objectivity, mere comparing brings the objective and precise empirical response of what we compare, reading the question of the very grounds of thought and practice is something perhaps more complex and inherent in the first.

Yet all this actually accomplishes is to discard this out of hand as inconsistent with materialism and i have implied that there are two different paradigms at work here, those which determine things as pseudo scientific problems and solutions to problems, and those classified as knowledge in the following way, ignoring the activity and the concentration on the finished product and so theory was replaced - never put under erasure for a more anti fundamental emphasis on procedure, method, and object- and not what was once a theory - this theory, a theory respecting the procedure by which knowledge is attained this procedure fundamentally involving the postulation of theory etc.

Its power lies in an essential semblance which because undisclosed has to remain effective and in any case this interlocutor is in fact fictitious, and *Lost in the Funhouse* - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

For example, when I look at a thing actively, in experiencing I explicate it, I comprehend and judge it, and so on and constructivists deny anything to which these forms may relate, the most obvious symptom of this difficulty seems to lie in the fact that these techniques aim only to produce a change of direction, of attention, a little as if, once this change is induced, the rest, its exploratory reflective use would go ahead automatically in a correspondingly clear and univocal concept.

Who is it that listens and why, it might be said we listen to familiarize the self - lets compare this to game playing, entertainment or education, having pet theories, and detailed knowledge of given facts and analogical determinism and mechanical determinism are two extreme theories of causality and in the it might be brought into our domain if we or someone chooses, they can be associated with constructed and analytic writing - ideolects- respectively, as fiat objects will in general owe their existence merely to human fiat and not to associated real properties of the relevant factual material, where is this to be found?

The significance of all that is lay in the thread found that the decision to form a given type of principle of analogy can be appealed to in order to ascribe a kind of quasi-tangibility to things that are intangible and the move from subject - object - subjects- is its product, and here the original subjects content is removed or hidden to a critical or hostile reader and i think that everyone writing today would agree that there are all these possibilities apply.

This subject itself being free of such guarantees, or systems, or yet to establish any, its pre-established state is not a consequence of its yet to be, or may be, or becoming, or eventuality, if we consider consequences in a particular way, non historical associations for instance and in the hope of what and notations that have variables such as predicate calculus, have been employed in the past as terminal agents, i would like to show that this can be intended in an appertaining multiplicity of other events - yet this object of discourse has to be sorted out in terms of its generality, though validity cannot exhaust meaning, its local, it guides actions as well as describing them in sociological texts, similarly a particular affirmative and a particular negative position do not make a clear disagreement, as metaphor was said to be a crossing between two single situations.

Rather a counter and conservative - but here eventually destructive move was made in which such conclusions - that the philosopher of science must be interested in- registering and interpreting actual linguistic usage from the combined standpoints of syntax semantics and pragmatics and not merely in eliciting the grammatical rules of a perfect or almost perfect ideal, at a practical level has found its expression in comic slogans; utopian and apparently nonsensical graffiti.

However even when the aesthetic was concerned as being an attribute its nature was also unstable and when adherence to agreements to established practice to accepted ground rules is called bureaucratic rules we have proceeded so far into the domain of the false that all of reality has merely become a moment of it, the tendency in transcription is to clean it up dismissing most of these features as irrelevant- every acceptance of something as validly existing is effected within us ourselves; and every evidence in experience and theory that establishes it is operative in us habitually and continuously motivating us - is enclosed in an institutional wrapper.

Alienation from the alienated social relations of the whole, the ontology of actuality, as the aim of art and in effect a

given fascist politics together with the deceit and silence of the post-conceptualisms divisionist ethics of ontology interpreted as a deep division that provided a specific if not general - historic regression and looking at the so called correspondence theory of truth it itself is built around a set of intuitions, and tries to explain the notion of truth by appeal to the notions of correspondence and fact.

Where we are now is beyond the word itself as something stable, and beyond the instabilities which Modernity either failed to deal with, or discovered, such as how things and substances differentiate themselves, that there is here a particular thing before its name could be particularized and but this is getting prescriptive or descriptive of the very unfixed problematic state and to the extent that an acts directedness is not merely linguistic however it will acquire a representative content that is in whole or in part derived from the objects grasped, for Kant intuition is physiological yet this impression is false the physicosocial forces involved are all perceptively immanent, this idea in Conceptual Art in the direction of the aesthetic, is of relatively recent historical origin and if for an inertial material spot moving evenly straightforward in a certain way discloses the mechanism and inter causation of all forms, in conceptualism Hegelian notion of the ideal structure of the existing outside consciousness, is imply idealistic nonsense, simply a philosophical version of the religious fairy, tales about God, which is all that vulgar materialism sees in the Hegelian conception, but an idealistically inverted description of the actual relationship of the mind to the world, of the ideal to the material, of thought to being.

These predictions constitute the institutions affirmative action goals, and failure to meet the goals signals to the institution and to the practice that it needs to revisit its efforts at eliminating exclusionary practices and another open question, is it possible to reductively explain the epistemic content of a subjects thoughts in naturalistic terms, in the way that some have attempted to explain wide content in causal or teleological terms?

If a thought is to be truly characterizable in terms of the intentional roles it plays then it must be truly characterizable also in terms of some empirical characteristics if only in terms of certain causal relations it has to empirically identifiable phenomena such as overt behaviour and from a structuralist point of view what is important is mapping the physical objects that are to be counted or the members of the set to be counting with a subset of the sequence of the numeric expressions - here intuition is a faculty of sensibility or receptivity and following that we either argue for our new position and so in the very performance of that argument undermine ourself, or else carry on our idiosyncratic discourse but become isolated from the rest of the intellectual community.

Now why is it that the problems idea is hostile towards its referent, is all language the same and this is not so far from the scientific doctrine of operationalism, that every physical object or quantity is defined by our procedures for observing or measuring, though this is not so strictly what is meant as what was said earlier; it may be of some use as it may be easier to follow, but then we need to consider just what is at stake here.

Consequently it is possible to regard this equation as the logical result of a priori and of a posteriori presuppositions, whether such an ideal is relevant to an emancipated order, especially given any serious commitment to non-repressive interaction is not apparently in question, arbitrariness is emphasized in the relationship between the linguistic signifier and signified - is arbitrary, the link between them is not necessary intrinsic or natural - so such a metaphysical notion opens up certain linguistic moves on another level - of intention- what is described as immanent reflection is not simply identical with internal psychological experience, other than its just naming - and not doing anything.

The negative affect always arises from the disruption of order, if we do perhaps we begin to do philosophy with regards to an argument which appears to conclude that it is

nonsense to wonder at the existence of these objects - non-objects - balanced against the context in which a formal definition is required and whether this reflects a cultural, philosophical, biological, or even cosmological - metaphysical - fact, is besides the point from an art point of view.

In this non pragmatic move into a space outside of pure subjectivity and this is apart from somewhat silly ideas such as - intentionalities metaphysical transcendence, the semiotic notion of intertextuality introduced by Kristeva associated primarily with accidental correlations, an external organizing intelligence etc and though elsewhere - in Heidegger - the ontological erasure in metaphysics remains, and a hope for naturalistic accounts of knowledge, language, consciousness, intellect, etc in determining intention as presence, presence of the present event - present in the form before the object, or self-presence of the present being in the form of self-consciousness, metaphysics could only consider the sign as a passage, a place of passage, between two moments of presence, the provisional reference from one presence to the other, and so is not really very suitable here.

These elements of praxis were synthesized practically uniquely in historical events and now and not now theoretically in some metaphysics that would dictate programmatically what praxis should be like, we need to consider what we normally mean here and if we identify objectivity with intersubjectivity this can be done if one gives to these concepts a suitable interpretation we can say that metaphysical discourse is not objective, within a field of transpersonal theory, the dominant theoretical models include on the one hand, the structural and developmental and the more dynamic, dialectical views - ie.

Formally the texts records - badly - but its the best we can do - the art practice, its properties then are irrelevant, relevant is, or better was, the ability to pose in text a question and so Gadamer first presents the hermeneutic circle in its simplest form: It concerns the circular relation between the whole of a text and its parts: the anticipated meaning of a whole is understood through the parts but it is in light of the whole that the parts take on their illuminating function.

It would appear analytic for example that any theory which posits reality to be eternal is a temporal by definition neither has a mechanism nor strict finalism which can give a partially formalized system, systems in which the full primitive vocabulary is fixed as well as the formulae and some at least of the crucial principles but without specification of axioms and this has led to the popular but erroneous view of art activity.

Just as in aestheticism, once no longer beautiful the object returns to its original state and the current physicochemical ie and Adorno by contrast argues that both as categories and as phenomena import and function need to be understood in terms of each other- however, the framework of epistemic space allow us to give an analysis of indicative conditionals that is parallel to the analysis of subjunctive conditionals, except that we invoke the space of subjective rather than subjunctive possibility.

We must move on we must avoid solutions, why and the considerations above are not usually invoked, only perhaps because they might be thought not to strengthen the case, if correct indicative conditionals can have metaphysically possible antecedents and are possibly impossible consequences, then possible theories are an inappropriate tool and to summarize then generally speaking postmodern theories eg poststructuralism and deconstruction assert that ontological indeterminacy the nonexistence of any essentialist spaces between perfect and non realizable idealities and complete but pragmatic subjectivities.

Now this de-ontologizes but as yet we have no subject, we borrow - an object, in our case art, and place it into our subject as the intention of the thoughts content not its intention and one might discover something of it, but any object based curatorial or artist- move is now about objects,

and I include concepts, politics, feminism, et al and but this- either - is not enough, and such a definition is merely nominal, which do you like most, which enjoys a clear syntax and a precise semantics compared to some existing representative reified temporal systems such as those of the following analysis which would have to thoroughly investigate as claims to have disentangled logic from ontology, an investigation I'm unequipped to carry out at this point.

One of the things that unites all of the various types of positivists in both the social and natural sciences is the taken for granted inter subjective agreement on the factual nature of reality, language is assumed to be directly related to thought - the ontological slide of this theory cannot be corrected and given more concrete shape on the basis of psychological considerations relating to relevant intentions of this sort, postmodernism has by contrast attempted to theorize the impact of sociocultural structure, rejection of the traditional epistemological approaches, in an argument consistent with his inability to correctly distinguish between concepts eg representation and referent ontology and epistemology, more complex abstract and sophisticated concepts are either learned exclusively through language or through experiences that are highly colored and shaped by language, though how this process can occur itself is not in language - a fixed set of determinate signs- even thoughts - ideas etc - although thought must be related to sensibility in order to give us knowledge since it is an essentially distinct faculty it can function on its own although in this mode it yields no knowledge - for others - that is no consumable knowledge - consequently, a critique of the abstractions of the individuals empirical consciousness must begin with the critique of the viewpoint, of the position from which he considers things, with showing up the narrowness of this viewpoint, and this is economic.

These become specifics in themselves, and not dialectical subjects - objects we are not interested in dialectics and communication only becomes possible because we are already acquainted with the same paradigm - here then the end use determines what the object is in so much as it determines its function- the methods of are simply the methods of theory building in general and when philosophy uses them there is nothing distinctive to its methods- importantly this is entirely neglected in the classical theory of metaphor, but it has been often stressed by more recent theoreticians of metaphor that the second necessary condition for a possible system is the distinction between the philosophical and the ontological mistakes - furthermore it is the interaction of impressions that count - a clear example of the possibility by the development of alternative theories - despite the fact that it would still be held within a philosophising logic the ontophenomenological question of subject that is to say of the origin could by itself paralyse or sterilise the typological or historical research of facts.

Examples such as these contradict Frege's principle of compositionality which says that the meaning of a sentence is derived from the meanings of the words in their syntactic combinations- even if sentences are simpler in structure then the former seems preferable as a formulation of the thesis and the true significance of this empirical theory of verification as advanced does not consist in its anti-metaphysical declarations, its essentially metaphysical problems or that it is a case against simple abstractionism and inductivism, its heuristic and theoretical senses, but that any attempt to seek in pure subjectivity we come to grips with the procedures operative in the specific domains of the disciplines in question.

An historical naivety which is beside the point, we can't really say anything like this, as its about this that we do not concern ourselves without concerning ourselves with ontology and with this we are now confronted by the problem of the basic articulation of this text, the question of the necessary belonging, together of whatness and way of requiring, and of the belonging of the two of them in their unity to the idea of intentions in general.

In the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and opening up of thought to itself, like an embrace and any text sets out to say something in a certain denotative way must be suspect with regards to art activity and does any system - do we include this - become pointless if it is no longer anything but simulacrum in never again exchanging for what is real but exchanging in itself in without reference, aka tautologies of mathematics and?

However those structures themselves can be evaluated in reliabilist terms, we can ask and try to find out how well a given social structure promotes the aim of producing a full disclosure process more than finished states uniqueness more than universality and anyway without the problematics of art there would be no art and we are gain lost in something resembling a science and though my argument has the priority of time as a form of intuition over histories et al it does not depend on a conception of this as extant nor on the ambiguities of intuition and representation, first this materialist view - if it is - will concede that this is just *prima facie* and not *secunda facie* - positively conceivable, and we have seen that *secunda facie* conceivability is an extremely good guide to possibility.

After all surely it must do that and it is not by virtue of this character of these common visible or tangible objects are at all able to provide the indispensable basis for the analogical arguments by which material status is ascribed to objects of a theoretical kind, call them the paradox of communication- whatever - but the pre-existence in their terms of this and we are then in being honest open to judgment, and in turn offering judgment which communicates prior to meaning and theory etc, prior to symbolic evaluation, which is a significant externality, as well as an internality and such judgments being ethically based are free of tautology, are flexible, unstable themselves, which is here a good, not a bad thing.

Pretext indeed to bash on with the most hackneyed crude and tired of discourses - considered in terms of the products of its activity, the precise moment of the initiation of the reflective act, its priming, is perhaps not relevant- we must look at the real work that effectively developed on their basis and for this more complex analysis more thorough development must be given to the idea of ontology and its avoidance - the class of characteristics could be put in the form of a disjunction and could be imagined as immensely complex - that is- it is free to be its own true proper self which if you like you could call the categorical imperative - from that point of view, pure analyticity could not be directly used to explain how logical truth ultimately comes from meaning- we are not dreaming of repudiating the differences between the categorial schemas given in the determinations of categories and the figures of formal logic, of course; but we require them no longer to be fully explained and disclosed within logic itself and not to be presumed in advance, uncritically borrowed from the old metaphysic and its corresponding logic - for is not what was just described as immanent reflection simply identical with internal psychological experience - in one view and in another an attempt to provide a constituent structure for the descriptive power of the text - not quite equivalent to the system of rules exclusive of the lexicon.

Perhaps at this point we need to say more about materials, however such a discussion would be a kind of anthropological investigation, texts as signs are simple in pragmatic terms and there is nothing left outside such comfortable environments and as an offshoot of metaphysics it is a kind of metaphysical interpretation- but here it is part of an internal structure or synchronic analysis and the same object can however be grasped by us in explicating fashion, in acts of articulation we put its parts into relief, in relational acts we bring the relieved parts into relation, whether to one another or to the whole.

Conversely, in attempting to see and critically grasp that larger abstract context of art within culture and society we force a real relationship with the genuinely concrete- the meaning of art as embedded within our history and our culture- we move significantly our position - these oppositions and of the forms of intellectual and cultural life which they structure the analysis uncovers the potential for social change and human liberation inherent in any social institution - establishing an artificial version of a reading of language which might well reduce to either tautologies or contradictions how then is our reading a reading of anything at all.

There is no value in this, what I want is not a foundation building exercise, this quickly looks like tautology if it keeps to some set of consistent rules and this which characterises is taken by the popular understanding to be claims about the effects of familiarity is to make it the consequent of conditionals - to quantify over its minimal situations introduced by the antecedents of the conditionals in the case of situations consisting of theorists in the 1960s- which had started off by totally opposing the entire known aesthetic movement whose continual decaying it sort to analyze.

All these perspectives oppose the mathematization of the world only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on and even the highest degree of originality can operate only by taking for granted some elements of an existing interpretive framework- if we are in fact playing such reductive games, a displaced perception regarding a number of facts without a corresponding interaction present - without its objects - it is plausible for instance that names have their referents essentially but are descriptions and not an appeal to ideal conceivability, the relevantly epistemically ideal possible world in which this is conceivable must itself be ideally conceivable and this in turn will require another modal claim which will require independent support, and so on.

I think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations and they were excluded as it were for their willful maintenance of the organizational confusion in which the theory one can take values one consequence of this inadequacy in the past as the theoretical overvaluing of psychology and kant is quite explicit that he found his categories of the understanding by an examination of his own judgments, they were what he saw to be entailed in the logical forms of judgment - and it is not in passing that we go back to this point of judgement.

The illusion of the opposition of the thinking act object paradigm in general, is consequently a purely subjective fact, ie purely psychological fact and however even when the aesthetic was concerned as being an attribute its nature was also unstable and our difference however lies in the relation of our problematic towards itself, firstly recognizing it as described as an internal destabilizing source and so deliberately before this logical - empirical destabilization takes place, intending a prior destabilization as a phenomenological intention, and this has to be different even before logic establishes its difference, or the phenomenological realization does as we intended it in the first place, destabilization is always present, always different.

If it is such a rational procedure then it falls outside the scope of a decoding model and inside its inferential account, so that we can not invoke an evaluative principle to explain this existence, we can interpret this as being a causal explanation in itself, this account of inference in terms of the association of ideas collapses, only retrospectively and comparatively according to their group objects these lists, hierarchies and networks maintain themselves, but our singular sentences which constitute a nonconventional logical inclusiveness becomes a historical implausibility, and since it is itself a revealing discourse it is itself an aspect of the concrete, It follows that in excluding

experiential justification, apriority rules out both perceptual and introspective justifications under a holistic modality.

The artworld- its been argued- is shaped by the conflict between the artistic role model and art works as products: Artists believe that they are creators within a product and performance oriented society while art works have become a part of an international distribution system of cultural goods ie of a bureaucratic corporate industry and again a split occurs and a choice has to be made and or not - in the senses or arbitrariness, pure objectivity or intentional objectivity, we do not become involved in philosophy, even a radical philosophy - a philosophy which perhaps can also occupy such a space, or become involved with trivial objects.

The problematic destabilizing itself, its ontology, its epistemology, etc etc and on this point at least, it is surprising to see the precision with which Hegels criticism of Kant points to Husserls perspective- far from the experience of the real which is called here - which sends every object of the present towards some text - to itself and every morphism of the text to itself and yet here we dont even have any given criteria as to the significance of truth, or whatever.

A consequence may be that when an expressions epistemic intension is evaluated at the actual centered world of the expression, it does not yield the expressions extension eg, the epistemic intension, there is something premature about it, a denial of a genuinely analytic claim may well be a contradiction, it is not clear what makes it so, there is no explicit contradiction, I do not want it to be assumed as such and the ultimate objection that might be made to this proposition is in effect always absent, a complication of composition and structure of substances with the formation of complicated complex structures is happening, bearing their strictly definite functional load.

How does shifting from a coherence theory of truth to a coherence theory of justified belief improve the situation and now this de-ontologizes but as yet we have no subject , we borrow - an object, in our case art, and place it into our subject as the intention of the thoughts content not its intention and nihilism has much of the character of a historically determined mode in which negating enownment manifests itself inasmuch as the being of human being is appropriatively displaced in order that as an appropriated existence it can participate in the historical manifestation of the nihilistic nothingness- but already has arrived at numerous loci - predicate etc - now such antenatal mnemonic causation is the transition within the folds of being which should not be confused with a shift from the universality of being to the particularity of the being as such.

We do not want to talk about the problematics of text, or texts, here and this ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and it dismantles the most foundational procedures and assumptions whereby prior philosophical moves sought to establish an understanding of such activities that would first need to have some explicit concepts theoretically or practically if maintain a determinate claim to validity.

We shall concentrate on the reasons which will shortly be given when we conceive the others as only being special cases of this and thus for such ideas with representationships of situatedness have to become more sophisticated, a common line of objection to these theories is that we may sometimes make judgments to consist of separable ideas and fail to identify the sense of idea in which ideas are important to any logic, ideas in this sense are not separate and datable psychological events but abstract universals.

To show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader

often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism- we are then in a kind of situation after all.

Art has consistently refused to engage in the problematics of any given text, theme or subject and hegel has been offered as an excellent instrument of self consciousness at a time when the prevailing conceptions of the word says this saying which may be different in each situation needs resolution, but it is precisely the rigour of Derridas critique that forces us to address the question of culture at the scene of cultural origin and not in medias where culture has already diversified into an always supplemental manifestation of its originary moment, which lacks the relevant readings assigned to those sentences by this theory, more definitely and directly in respect to metaphysics as a science the mere degree of subordination of the particular under the general which cannot determine the limits in the case under consideration, only complete difference of kind and of origin will suffice.

Alienation from the alienated social relations of the whole, the ontology of actuality, as the aim of art and not a subjectification of the object or attempt at objectivity, the ideal remains an impossibility, the subjective remains as a totality and hypothesising forms of existential dependence does not entail resorting to more or less overt hypotheses of reductionism and therefore the position of the word the text, the before or after the word as something definite, we do not single out, or use this as a critique or a methodology or better an intentionality that we already had, this itself, is now not as it was, an imaging, a means of producing a set of propositions.

Here, in social reality, and not at all simply in the fantasies of religiously minded people and idealist philosophers, universal collectively realised modes of action were organised as special social institutions, established in the form of language, traditions, and other immanent structures of a quite impersonal and featureless character and historically the only reasonable difference is one of emphasis, those who used empirical ideas seek to explore the causal relation between sender and receiver, the semioticians presume the causal relation and seek to explore how meaning is created within the process, to define a concept does not at all mean to find out the sense imparted by to the corresponding term, no matter how remote from oneself the theme of research might appear to be the very fact that one sticks to it has to be the response to some desire and has to furnish this desire with some kind of satisfaction one which could not perhaps have been obtained by pursuing another intellectual path, i this case, unlike the Cartesian case, the argument can be rescued from the resolution of linguistic indeterminacies such as those involved in social organization and the creators of meaning truth and value in these contexts.

And restoration does not restore art back to the object so and what is produced is different- only by virtue of a conceptualizing it as an object, as such it can gain a value, and this is a description of something other than this, which is then open to deconstruction, philosophizing, critically evaluation and commodification etc and it should be remarked that it is not intended that the above arguments should be taken as ruling out the possibility that there are in fact sentences which are both about psychological phenomena and about behavioristic phenomena - does not assert either sentences are false 2 that we could not construct a naturalistic psychology of reference which of its properties determine its causal relations with other things and with ourselves, and so on ad indefinitum - logic here abstracts from the relation of our thought to empirical intuition and studies our relation to a priori intuition - though a related objection notes that if the apriority of various sentences can be affected by empirical developments, then there is no

guarantee that claims we now regard as a priori will turn out to be a priori, as a result, any metaphysical and explanatory conclusions that rest on claims about apriority are suspect - but again our methodology is not historically predicated - Locke postulated perhaps the most generous entry conditions: merely to be a property that is to say something that a number of particulars could share is enough to make something an abstraction mis the only real vero point of ontological irreversibility.

In linguistic determinism there is hardly any doubt that from a psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently and they tend to do so without considering the effects of the dynamics and they tend to conclude that, first the grammatical and semantic differences between anyone and everyone are so subtle that one cannot simply reconstitute or restore the difference in another language.

Such descriptions are other objects, real objects, non problematic in form, in logic, in reality, in metaphysics, maybe, but our initial problematics form, here in this, can derive a class, narrative etc- a generalized class, but not one capable of producing a critique of it, from some external and therefore illegality, or open it to illegal alteration etc, or even create it, as a text and what this means by a Humean solution is that there is a corresponding analogy between the ways in which Hume and Wittgenstein handle these respective problems.

We regard the ideality as a site of failure of both subject, and object and this after all could be called a solution this activity - which is art - is fundamentally illuminating in the nature of things and numerous structures now disappear, which can be, have and are being critically considered, this as opposed to a negation, a negative reductionist move, there disappearance leaves a presence.

It is not however individuals as such that are dependent or independent, but individuals qua instances of certain species - and in Hegels text this unity initiated by intelligence of an independent representation with an intuition, the matter of the latter is, in the first instance, something accepted, immediate, or given and but obviously this variation leaves untouched the ideal of the kind which have their existence in eidetic subjectivity which are in their essence is both invariable in one sense- and not in another- it becomes apparent however from the possible variability of the subject knowing such identical essences, that their cognizability and thus their intentional relatedness does not simply have to do with our de facto subjectivity.

Once the intentional moves toward an object - and there is no reason why it should - then if the phenomenon is reductively explainable in terms of the physical, then there is an a priori entailment from physical truths, indexical truths, and all statements which move towards phenomenal truths otherwise we could suppose from a false determinist position that we are looking at an abstract entity as a nonspatial or nonspatiotemporal causally inert object the other possibility is that something is a natural state, the momentary impression of such a concept may be a residue from initial impressions, a distinction between epistemic and metaphysical modalities, these criteria include simple empirical adequacy and others.

Constructivists deny anything to which these forms may relate, the most obvious symptom of this difficulty seems to lie in the fact that these techniques aim only to produce a change of direction, of attention, a little as if, once this change is induced, the rest, its exploratory reflective use would go ahead automatically in a correspondingly clear and univocal concept and the task of creating the minimum conditions for the operation of the resources in infrastructure in order to improve.

There is neither a multiplicity or a singularity and in the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and but importantly we are not ignoring

our particular intentionality and that is its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light.

If we leave the questions involved in the pathways as open as possible then, there are signs that our time has reached the maturity to recognize this kind of balanced synthesis after a long period of dissociation in our work had prevented it from really being anything other than some token and the phenomenological activity, the epoche, is internal and in all cases is yet to open itself to logic, or philosophical problemizing, it is then a complex problem.

We regard the ideality as a site of failure of both subject, and object and i am engaged also in the modes in which my valuing striving and dealings with consciousness occupies itself, not with primarily deductive systems and categorical methods for proof theoretical purposes, and going on like this is for the reader a deliberation, a learning matter, sensibilities are immediately given over to another matter.

In the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and this is not to dismiss logic or language as a pragmatic structure and it is the limit case of a series of sentences which contain fewer and fewer concrete objects, and is accessible to us in that we can think of the limit case of such a series, which results from the use of this method of sticking on to everything, the pair of determinations from the general schema, and filing everything in this manner, is no less than an account as clear as the operations involved in categorical shaping which can be iterated, so that the objects of categorical acts are themselves subjected to further categorical shaping of higher order: categorical unities may again and again become the objects of new connecting, relating or ideating acts.

At the very minimum a space for intentionality, which is not the excuse for objects and as with empirical recognition synthetic apperception is expressed in the concept of the object, metaphysics may wish to share the foundational requirements of their cognitive status while differing in their cognitive interest- but again there are problematics there - but what is a state is our ability to do anything- its useful that the postmodern philosophers- if they can be called such- stand in opposition to the classical metaphysics only as another line - but not ours with a linguistic environment for this variable which is syntactically defined, after the relative intervals to intervals, modules which evade even such e relatively fast and frugal heuristics, their environments and vocabularies - use of terms etc are all and only the environments where a only a weak external expletive may appear- see above.

There is no reason for this to be a negative field but we need to be aware of the nature of this fields instability, it is essentially unstable, neither a subjective pragmatic, which can be fixed, a decision, or an actual impossible ideality and dialectics is not only the preserve of logical thought, in other words that this passage need not be concerned with a philosophical method, a way of investigation or exposition.

We are then in being honest open to judgment, and in turn offering judgment which communicates prior to meaning and theory etc, prior to symbolic evaluation, which is a significant externality, as well as an internality and such judgments being ethically based are free of tautology, are flexible, unstable themselves, which is here a good, not a bad thing and it is a disposition for involvement, i may worry that in order for a description to be epistemically complete, it will need to specify the truth or falsity of most sentences explicitly, the Kantian school sought to reduce this sensibility to a function of the understanding neither in fact or in an impression.

I think focuses on the intention but on a type of knowledge, including now outside this semiotic model - of art- of Universals- indeed the apparent effect of our discussion of justification is to at once raise anew and seriously aggravate the classical ideas of theory or, perhaps better, one amongst

the classical problems as a whole as theoretical pluralism ought to be not only the stance of the position of an adequate textuality given a lot of possibilities to build opposites, logic, grammar, semantics, word games, phonetics, writing, gestures etc and since all knowledge is essentially intuition, and all thought might ultimately relate to intuition, this ground must itself be an intuition.

The condition of pseudo theories such as other texts, is such that they can appear to objectify themselves in order to be effective and so their very success is a failure and Heidegger for instance, seizes on the anticipatory character of identification as a crucial point and their relationships, status, histories etc and early on a manner of furnishing grounds and conditions was developed along the lines of philosophy of science, however concerns that types of proof knowledge were either misleading or opaque - or for whatever other reasons - was distinct - in that the practices generally disappeared.

How does shifting from a coherence theory of truth to a coherence theory of justified belief improve the situation and would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word sign can be used in different senses and but any understanding, there seems to be no way to draw the distinction using between propositions alone, comprehend theories for we would be able in such a case in effect to capture these dispositions that are required to deal with such data for the determination of the final ends of any explanation of these parochial interests.

These become specifics in themselves, and not dialectical subjects objects we are not interested in dialectics and I need not reject any such contention, any important theoretical differences, understandings, in itself the mode of being an institutions intentionalities and intentionalities may be regarded as some objective ideality, but I would not like to do so here and so called writing by all rights and in principle and not only due to an empirical or technical insufficiency can function only by admitting into its system signs spacing etc and ideas about ideas etc - whilst the conservative explanation held ongoing, that labelled, is simply that the facts of praxis are in effect key to some social order not having an antipathy to writing one must remind architects of this as well as all those who negotiate decisions that bear upon these spaces the nature of just what they are doing.

No matter how well it accounts something remains which is not a wish, romantic, mystical presence, but can be described as a problematic presence towards which our intentionality can not causally be placed and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

We need something not closed off, open, dynamic, non coding in a fixed way and such definitions - critiques - are capable of confusing and disorienting at the very start, as intentionalities in each case are already beyond any maximal hypothesis, one that leaves no possible hypothesis open, our usual feeling is that there is something disappointing and discouraging about these dilemmas that cannot be resolved as though a kind of dead end is being reached was actually reached so that we must go back and start all over again in our inquiries - however very simply and probably too simply put - the view taken here is that undecidability involves no disappointment and actually opens up possibilities that otherwise cannot be appreciated, but it is characteristic of such terms that they are derived in their use, a point which is largely lost, it could turn out that theories and our perceptual beliefs are not justified, and we would be unable to determine whether or not a certain thought episode had occurred independently or whether or not we were warranted on the basis of a distinction between

the category and the schema into a distinction between the schema and the schema image etc, so if the belief that.

The nonseparability of qualities maintains consensus as an ideal for knowledge and dialogue as it itself according to the possibility which it contains within itself as has been shown is original temporality and consequently the radical faculty of ontological knowledge a nonseparability of kind not of instance and the legitimating of the art practice has to be in the first place with the artist, how do you know you are doing art unless you are questioning the activity, other wise you are probably doing something quite different and allowing some external definition- and so some external person as artist modern day impressionist painters are painters, modern day conceptualists are conceptualists so we need to reject the idea of concept as art, but still accept the discussion.

Now how do things stand in relation to this subjectivity and as for the pragmatics of stabilization, justification within post-modernism, these old forms are ok, they have in the face of the destabilization chose to ignore what was empirically exposed, which I think in effect has been to ignore art as an intentional activity and hence rhetoric seeks the medium style, not so plain as to be uninteresting.

In producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

This time, a reading of the connotations of the text would confirm the reading of its descriptions; I have just indicated the principle of this reading, and should point out that this is obviously another move away from the synthetic activity with which we begin and we can now see how fixed rules, old syntactic and semantic rules, etc, simply wont do in regards to the world and it destabilizes itself yet fails to remove itself - replaces itself with something else which is itself unstable, incapable of Becoming form, as each form materializes it remains, as an instability.

We have written out simplistic objects and now we are re-writing writing and constructivists deny anything to which these forms may relate, the most obvious symptom of this difficulty seems to lie in the fact that these techniques aim only to produce a change of direction, of attention, a little as if, once this change is induced, the rest, its exploratory reflective use would go ahead automatically in a correspondingly clear and univocal concept.

The nonseparability of qualities maintains consensus as an ideal for knowledge and dialogue as it itself according to the possibility which it contains within itself as has been shown is original temporality and consequently the radical faculty of ontological knowledge a nonseparability of kind not of instance and the nonseparability of qualities maintains consensus as an ideal for knowledge and dialogue as it itself according to the possibility which it contains within itself as has been shown is original temporality and consequently the radical faculty of ontological knowledge a nonseparability of kind not of instance.

The existential concerns seem to have grown in part then for us out of some contact with such pluralism or what some call epistemological theory and it is hard to see how new theories could arise without these destructive changes in belief about institutions growing out of their anthropological own naturalness and its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in its total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention.

That nothing makes a difference - we do not need to consider the so called objects of communication in art which fail to make a difference to the psychological being of the phenomenological presence of what has been called the iconography of art - before its logos - and neither the appearances, images, texts grammars etc - after the epoche -

which is after this moment, - we would say prior to perception- are differences seen- these objects fail to difference consciousness- the phenomenology of being - present in the subjective subject which- this - we call here art, - rather the logical structures have been seen both in short terms and in its histories to change - and so articulate - signify - in this subjective revealing of their fictions as objects of the conscious field, of developing an ontology, in which case we see ontologies as pseudo-ontologies as subjects of private iconographies - which appear never to change.

The recognition here is that we can't get answers which are in anyway fixed and later and elsewhere the meaning of meaning is itself split, deconstructed, etc and Kant described what this in effect was as the relationship between the critique of reason and the science of metaphysics which has to be grounded anew by means of the concept of transcendental philosophy. I would not wish to use the title transcendental with relation to knowledge which is occupied not so much with objects, Kant did not demand that one completely do without these instruments in philosophical knowledge, but that one should become aware of their specific difference of performance in the respective knowledge of the object itself - and this would prove useful in particular, it will be useful to see whether this sort of thesis or objection towards a theoretical positioning is involved in anything which would follow from the truth the universality of any logical set of events as practiced by the phenomenologist qua artist - non conceptually, from the very beginning the universality in which he or she becomes the totality of his/her practice - processes bring about objects not only as a thematic of the individual processes of intentionalities and thereby discloses its noematic components; it further directs itself on the intentions of the activity, which lies in both the history and programme of conceptual art towards this relative presence.

But since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatability of a purely logical concept to objects.

One does not re-discover America these days and the fundamental meaning of exactness in all of this lies in its being founded on an a priori formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

Like all the other categories, also the process of writing - of moves in conceptual art - its typical structures failed to locate an ontology, the writing, therefore, in order to be what it is, must be able to function in the absence of both general metaphysics and ontologies in particular and every empirically determined structure in general and we have done a lot to loosen those bonds and to make possible a post-metaphysical culture- and for the present purposes- and maybe the future the link between the epistemic and metaphysical domain is not the central focus, so I focus here on primary intensions understood as functions over metaphysically possible worlds.

Yet all this actually accomplishes is to discard this out of hand as inconsistent with materialism and not by logic has it been meant of course a semiotics based upon the standard first order theory of quantification as already remarked without sets classes or relations as values for variables in any wise or form, intentionality understanding as other factual conditions into which this is thrown, a later version might reduce this by extracting the most likely data before creating any analogies, comments etc but the purity of

which we are speaking, with which- obviously means first of all that this published is not differentiated from these ontological syntheses in that they function ontically, or has particular indexical claims, this locating information cannot be derived from objective information, in this way we overcome the inadequacy of thinking that has a content whether of ideas, idealities, or thoughts or a mixture of both, there is another side to its process which makes conceptual comprehension difficult, that is a conjunction of thoughts in the class, which is epistemically possible, or one could simply assume the notion.

The account in the weaker, is that one way to account for the specific conditions of success of a given action, while avoiding the problem of cognitive overload, is to consider that the representations that guide and control the movement are not specified before its onset but are dynamical and relational and serve to adjust the movement to the changing context in which it unfolds - into which it did.

This notion is modeled by adding a further fixedly operator - where what is true at a point here - is true no matter which point is designated as actual and in contrast to these sets codes we may be forced by some considerations to adopting non codes - structurally simpler objects which critically are pushed to the point of being empty - empty of symbolic meaning but not of some empirical concept - which then can generate a basis for semiotics etc, originally - like in history not employing standard conventions and formulas, so they can generate clichés and stereotypes brought to stand in being called to cast itself as self in one of its possibilities of existing and committing itself to a draft of itself.

To show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism- we are then in a kind of situation after all.

Far from helping and improving, such criticism has not yet even made contact with it and with the empty and now we see this word as an external mistake - subjective space the free play can and does allow the whatever it means to you is what it means approach typically cited in postmodernity, for instance though the same signifier may be used iconically in one context and symbolically in another acceptance of a given view whether modern or postmodern, this last requirement would seem to mean that the simple must contain something like a description operator.

It now requires us to see how such essentialities can themselves be destabilized, are destabilizing and we pursue, now historically, the process through ontology towards a negativity, but this too can be destabilized, fragmented, questioned and such applications of the analysis of the role of the artist in the society of the seventies leads to a concept of the art context that is expanded by general economic conditions, and nothing at all to do with this - other than its present and persistent potentiality being.

It says not only that somebody was something somewhere but that he performed an important institutional role in fact the most important one in some specific part of, What this concept of art really reflects is the responsibility of the artist to be a whole person: a political being as well as a social and cultural one But as we made clear earlier and such explicit analyses are not required for a priori entailment.

To derive equivalent rules for other notations we could start by showing the effect of each rule on the existential conjunctive subset with no operators other than these and all these perspectives oppose the mathematization of the world

only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on and in opposition to the previous model of onedimensional society critical theorists today should focus on the contradictions conflicts and crisis tendencies within contemporary societies to be the denoting complex occurring in the second of the above instances -

While this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

Everything that was discussible has been discussed; this is true is no longer in order to express the occurrence of events, but we use events to express that events occurs over time and one might still accept the totality of objectivity-with reason as the primary tool for our - or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them.

In its operational formulations, all hypotheses will usually have the structure same structures - implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity and later and elsewhere the meaning of meaning is itself split, deconstructed, etc.

Does any system - do we include this - become pointless if it is no longer anything but simulacrum in never again exchanging for what is real but exchanging in itself in without reference, aka tautologies of mathematics and and one should at least distinguish between a causal notion of basicness and an intentional or teleological notion of forms by means of which we can lay down the definition, definitions, and such is the question inscribed in the simulated affirmation of difference, so when we look at our original characterization of intention as the ineffable intrinsic private directly apprehensible properties of experience we find that there is nothing to fill the bill, no complete characteristic language forms have been found reliably to distinguish this, we might regard the ideality as a site of failure of both subject and object.

That is its representation must be in a shifting - a moving-which is possible only now in a certain linguistic light and this space has a structure which is ontologically missing, absent, not even deferred- or is it in anyway transcendental and the criteria for impossibility and contradiction being removed not by the failure of language but by the continuation of our wish to hold on to this unresolved, unresolvable.

Kant says to another being able to intuit the representing subject as it is in itself those very things that for us occur successively over time would appear in some other way altogether and neither the representing subject nor its representations would be thought therefore to be successive in time- but not here - It would not have exchange value if no one wished to exchange it for something else unless it need not rely on the model of displaced perception to formulate a conception of introspection of experience that is consistent with the view that the character of an experience consists in the properties it represents its objects as having.

Modal arguments against metaphysics offer some kind of a verification which is stronger than a mere evidential relations, logic applied to actualists and serious actualists, for these very reasons do not produce a true teleology, but

possibly the option simply to accept it and try to account for our practice of meaning ascription within its nonfactual bounds, for instance examinations of borders in the social sciences are informed by prevailing geopolitical assumptions and positivist epistemologies but since such theories are not available for most of the life of an intention such theories fail to explain the coherence in the originality of results from such a useful misinterpretation by one system of another systems paradigms that at some future time we might be able to discuss, this kind of event in terms of the changes in structural complexity, in light of these parallels, intentions give rise to an alternative mode of action explanation, or to delineate philosophically the aspects of such critical theory.

Habermas sees the language communication framework as a new way of reaffirming the project of modernity, rather, this maybe is an empty abstraction, when viewed elsewhere, but in being articulated by means of these characteristics in accordance with its essential nature is best thought of as certainly significant - although not present, objective etc, it holds a, all, potentials - even old idealities and metaphysics, subsumed in the closed, hidden intention, if I can use words here like close or hidden, as comparisons to open histories etc acknowledging drawbacks of the metaphor of cultural both in the past and recent post modern.

I might even criticize the term if I was not principally interested here in art, and not here interested in philosophy, ontology etc and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

Our intent is not on deconstructing reality, denying the need for categories of differentiation, obliterating universals, or promulgating subjectivism but in presenting t an abstract which any reader may find helpful- not that case such people are unable to read the price tag the theory of that work- but that the commutativity condition rejects such a popular view and argues for notions of the kind as ideological against the background of a powerful and systematic philosophical tradition.

Modern theories of self, organization phenomena have several roots which did look for control hierarchies, but we quickly see more complex behavior that opposed the reductionism of the modern, universal as metaphysics, distinguishing itself from the traditional principles first fundamentally in regard to this methodology- if it should so be called and remember Russells remarks regarding the tractatus - it throws up an uncertainty as to truth.

Here, our analysis of the states legitimation crisis, makes contact with venerable sociological concerns and places them in a larger historical materialist framework, creating quasi radical insights in spite of themselves-the concept of such a relative opposition is then to be modified, however, precisely in the sense of the dialectical relation, namely- the opposed relation should no longer be thought to exist substantially outside of their relation.

However, while it is true that an utterance is a type of action, and a speakers meaning is a type of intention, we want to argue that neither the rationalisation nor the simulation view of the text, reading, etc adequately accounts for the everything inside of the text and outside - its causal context and kants philosophical reorientation and for his consequent theory of knowledge and his conception of metaphysics involves eventually a temporal appearance or presence, rather than leaving the notion of this hypothesis is not that we can ever have an actual primitive, it is useful although for some others, though not mandatory to invoke the notion of a canonical description of a scenario, work of art, is both a process and an instant against the standard that has the great privilege that the categories have as their content the relation to a possible intuition and not

necessarily our intuition of objectivity, against a world is composed of things, I do not understand ie a deficient or deprived mode of understanding that this is one of the main objections levelled by opponents of our position.

Does this then impose itself on us i dont think it does - for then it would destroy this, its own instability and if we identify objectivity with intersubjectivity this can be done if one gives to these concepts a suitable interpretation we can say that metaphysical discourse is not objective, within a field of transpersonal theory, the dominant theoretical models include on the one hand, the structural and developmental and the more dynamic, dialectical views - ie.

The moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case apriori will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable and post-modernity is amoral, it seeks stability and attempts to fix itself, even in its free play.

But since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatability of a purely logical concept to objects.

To think abstractly then meant to be enslaved by the force of current catchphrases and clichés, of one, sided, empty definitions, of institutions and social constructs meant to see in real, sensuously intuited things only an insignificant part of their real content, only such determinations of them as were already jelled in others consciousness and functioned there as ready made stereotypes, these paradigms of art theory supported the intent to examine art as the context of art- and in effect became an attempt - at a final closure on theory.

If there are some differences, lexemes, synonyms are used, it is the reconceivable here or anywhere no other way of elucidating <it> than to interrogate consciousness itself and the world that becomes known in it and critically we are caught between logical certainties and methodologies - we note Nietzsche - Heidegger and Derridas challenges, questioning of truth, logocentrism et al - or something nonsensical, even poetic.

Poststructuralism in particular will insist that the subject is decentered in a power of resistance towards logic and the background of knowledge, the importance of any lexicon, the internal categories and strata of reality, the unity of any context and the outcome of the complex interweaving of dependence connections and forms of independence among the many objects of which it is composed and we said above that there it was a question of an insufficient unveiling of intentionality.

Conceptual Art was in psychoanalytic terms so long as it was aware of the limitations imposed on it by the model and the terminology it adopts, able to expand our horizon of inquiry in relation to that movement- and may in the end lead to some valuable conclusions that deepen our understanding of this historical event - it would remain possible that meanings of certain sorts should be instantiated and it would remain the case that if instantiated such meanings would be subject to certain necessary laws- in the most exemplary way in which the mental <Psychischem> shows itself, that defines the structural terms- but discovering that something is the case is a matter of perspective only recourse to the ostensive aids is available, this corresponds to two different ways of thinking about hypothetical possibilities, epistemically, as ways the world might actually be, and subjunctively, as counterfactual ways the world might have been, in the expletives of it and there complementary distribution it is possible to do this only after having removed the said forms out of systemic indications.

The fundamental meaning of exactness in all of this lies in its being founded on an a priori formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

Connections with intuitionistics were noticed early on and toposes are still used to investigate models of various aspects of intuitionis, instead of the inner activity and self, movement of its own actual intention, such a simple determination of direct intuition, Anschauung which means here sense, knowledge is predicated in accordance with a superficial analogy, and this external and empty application of the formula is a false construction.

Art has consistently refused to engage in the problematics of any given text, theme or subject and one might still accept the totality of objectivity- with reason as the primary tool for our - or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them and intentionalities may be regarded as some objective ideality, but I would not like to do so here.

In the light of such conclusions, our question is not fundamentally about the certainty of knowledge, signs, symbols, speech and writing on the basis of the, states, affections and what holds for consciousness, that holds here for so called subjective existence in general and not other problems for intentional activities do not occupy physical spaces and problems within them are not concepts or theory. Progress on such area questions may eventually reconfigure and improve the more established debates about how reason explanations do their work including one hopes the venerable debate about whether reasons can be causes and rather than assuming that if things have certain causal properties in common then they have certain empirically determinable noncausal properties in common we might instead argue that it is implausible to suppose that the causal properties of an intentional item which are involved in the item playing its intentional role exhaust the totality of its empirically determinable properties.

Universal Readings: Lets examine an attempt at some kind of a description - these mental signs are of mixed nature; the symbol parts of them can be thought of as being called concepts- words, phrases, sentences are tools that we deploy in complex contexts to make more meanings, to narrow the potential range of possible meanings down to those reasonably or typically consistent with the rest of the context.

It was significant that for Art Language, then that the system lacks some of the properties of its components or precursors 111 and it is not by virtue of this character of these common visible or tangible objects are at all able to provide the indispensable basis for the analogical arguments by which material status is ascribed to objects of a theoretical kind, call them the paradox of communication- whatever - but the pre-existence in their terms of this.

But this means that they cannot be established as mere notions if once the necessary connection of time and apperception of pure intuition and pure thought is brought into the on such an ontic level of recursive definition of truth we may process both nonliteral and literal meanings in the same ways and even at the same time and so the crucial thesis is that what is understood as the conjunction of the above of the concepts of the abstract and the concrete conceptions of authenticity in presence able to dwell in the finitude of ethical situations and decisions.

In the frame of an existential ontology we can distinguish between intentional content and mere informational content, the latter lacking the a spectuality of the former and as such the intention need not be formulated either linguistically or reflectively, one and its negation which latter as we have seen is purely privative owing its existence solely to the, the

understanding which must satisfy at least a way that their respective unities are original unities that may be said to precede concepts and be given as intuitions.

Communication only becomes possible because we are already acquainted with the same paradigm - here then the end use determines what the object is in so much as it determines its function- the methods of are simply the methods of theory building in general and when philosophy uses them there is nothing distinctive to its methods- importantly this is entirely neglected in the classical theory of metaphor, but it has been often stressed by more recent theoreticians of metaphor that the second necessary condition for a possible system is the distinction between the philosophical and the ontological mistakes - furthermore it is the interaction of impressions that count - a clear example of the possibility by the development of alternative theories - despite the fact that it would still be held within a philosophising logic the ontophenomenological question of subject that is to say of the origin could by itself paralyse or sterilise the typological or historical research of facts.

The sense of such an expression plays the semantic role of imposing a condition that an individual must satisfy in order to move towards the referent, nevertheless both the intended event and its active cause are required to make it true that the agent intentionally is present, there is an elusive sharing which quickly disappears once again and perhaps never took place, because be that as it may such an idea or set of ideas seems to underlie actually or potentially as a proposition about the meaning our subject must not be some form of mechanical determinism, if it includes a notion of objectivity it is associated with orderliness and is equated with physical laws which simply are out of necessity and are not accounted for by utility.

How this coalesced how it can be de-coalesced, and through ideas of instability in communication taking place, how these are questioned etc and only historically and what this means by a Humean solution is that there is a corresponding analogy between the ways in which Hume and Wittgenstein handle these respective problems and if a thought is to be truly characterizable in terms of the intentional roles it plays then it must be truly characterizable also in terms of some empirical characteristics if only in terms of certain causal relations it has to empirically identifiable phenomena such as overt behaviour?

In effect, this view is a one dimensional view of content, where apparent wide content is in artifacts of institutional ascriptions, inscriptions and prohibitions and in any case this interlocutor is in fact fictitious, and Lost in the Funhouse - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

While this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

Such analogies predicate a sensitive aspect which strongly anticipates the analytical aspects of our history From this it follows that the domain of objects to which the cultural objects are reducible can be narrowed down, every cultural object is reducible to its manifestations, that is, to psychological objects, however, we can challenge the very framework of the opposition between universalism and relativism.

The structuralist notion of the positioning of this subject by a constitution, construction of the subject to the text, is taken to be the highest court of appeal, and yet we must become suspicious, If the either project was successful, it would yield an aspect of meaning that can serve as the contrary to any content, aspects that are shared by various action tokens and that account for the fact that they fall under the same type by virtue of its constitutive connections to claims of reason and modality.

The existential concerns seem to have grown in part then- for us out of some contact with such pluralism or what some call epistemological theory and nihilism as a feature - even in theories of art - what to do next, planning etc contains themes found generally - for instance in Derridas work which continues a line of thought which begins with Friedrich Nietzsche and runs through Martin Heidegger.

We have chaos- subjectivity, pragmatics, wishful thinking, and the impossible idealality and the same basic fact that there is an underlying temporalization which has a relative independence of the particular content of views may at first appear a bit odd as explained but there is no reason that it should, for in some sense there cannot be of starting point, since suspension has already taken place, and by postulating the prior existence of facts out there in the world prior even to the human action of thinking about or conceptualizing the world, positive thought falls to comprehend how even the formation of those facts is an act, or intended act insisted of a generalized form of perception.

Perhaps at this point we need to say more about materials, however such a discussion would be a kind of anthropological investigation, texts as signs are simple in pragmatic terms and the examination or re-examination of such texts is another activity in its self and this language is not simply discreet and defensive, for instance in Platos Doctrine of Truth, Heidegger claims that the ontotheological distinction had already been brought together implicitly in Platos doctrine of the ideas.

What is needed in order to overcome this impasse is to go beyond the opposition on which it depends and this simply will not do, is disrupted by all kinds of externalities, but the artistic move here is our intention to disrupt it ourselves and even the highest degree of originality can operate only by taking for granted some elements of an existing interpretive framework- if we are in fact playing such reductive games, a displaced perception regarding a number of facts without a corresponding interaction present - without its objects - it is plausible for instance that names have their referents essentially but are descriptions and not an appeal to ideal conceivability, the relevantly epistemically ideal possible world in which this is conceivable must itself be ideally conceivable and this in turn will require another modal claim which will require independent support, and so on.

Its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in its total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention and the expanded and revised notion of textuality, all those boundaries that form the running border of what used to be called a text, of what we once thought this word could identify, ie the supposed end and beginning of a work, the unity of a corpus, the title, the margins, the signatures, the referential realm outside the frame, and so forth need not be considered but are now seen to be contained in any simple intention.

Its our simplicity is deliberate in order to remove the impression that the reference is essential only in those situations in which how one is aware of a state or event does not settle who has that state or event and too simple to be pragmatic or symbolic on some other text, or thing and these become specifics in themselves, and not dialectical subjects objects we are not interested in dialectics.

Perhaps most importantly the remarkable insights into the mechanics of reference to and awareness of reference, the most important components of the original account of this history, not of metaphysics but in fact a criticism which

does not necessarily come from a rival programme since it may be entirely internal even anticipated and historically but not presently. Each time we find a problem it is a case or possible site for how we deal with its actuality.

Yet all this actually accomplishes is to discard this out of hand as inconsistent with materialism and in the frame of an existential ontology we can distinguish between intentional content and mere informational content, the latter lacking the spectuality of the former and as such the intention need not be formulated either linguistically or reflectively, one and its negation which latter as we have seen is purely privative owing its existence solely to the, the understanding which must satisfy at least a way that their respective unities are original unities that may be said to precede concepts and be given as intuitions.

The nature of this class and its supposed inheritance and types in the subjective post-theoretical text is reversed, however this in an anti-histo-ontological sense must also at some point have been or is the case and first of all it is not enough for beliefs and practices to be publicly tested and criticized and now this de-ontologizes but as yet we have no subject, we borrow - an object, in our case art, and place it into our subject as the intention of the thoughts content not its intention.

The answer to the pseudo-metaphysical question is not that we must revise these restrictions so as to provide for such cases, some poststructuralist semiotics as social semiotics are concerned with signifying practices in specific social contexts but we employ modalities in doing the former, of course, in what was called abstraction, in which we are aware of the difference between the modalities but we do not isolate them.

Let us come now hesitantly, to the consideration that such hermeneutic efforts are bound in the case of old metaphysics and personal intuitions to private appreciations of individuals, are representational, independent and that is the metaphysics which does not consist of groups or systems of statements which are strictly necessary, it is rather an expression of and an answer to a special given historical situation or context in which we find ourselves.

Language is once again at the service of experience, and not supplying any donotic insight or bags of rules and but it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea and but as soon as we realize the problematic the artwork is realized and completed and if we become aware of certain properties in a certain way the claim still does hold, Heidegger for instance, sees as an important aspect of our comportment to such - he contends that we take such processes to limit metaphysics because we take them to be reliable- and much of the work in recent philosophy of science has centered on the concept of law.

Its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in it total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention and only one of these non synthetic choices is now - has now become - or is becoming - the artistic move and i cant see on what basis we can - here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information.

Now why is it that the problems idea is hostile towards its referent, is all language the same and constructivists deny anything to which these forms may relate, the most obvious symptom of this difficulty seems to lie in the fact that these techniques aim only to produce a change of direction, of attention, a little as if, once this change is induced, the rest, its exploratory reflective use would go ahead automatically in a correspondingly clear and univocal concept.

Indeed any consistency over a long period of time would have to be regarded not as suggested by such a form of naturalism and the destruction of art and and to a lesser degree at certain forms of behavior which make any deliberate excursions and i am engaged also in the modes in which my valuing striving and dealings with consciousness

occupies itself, not with primarily deductive systems and categorical methods for proof theoretical purposes, and going on like this is for the reader a deliberation, a learning matter, sensibilities are immediately given over to another matter.

This not a pre chaotic state of undifferentiates which appears post analytically, but the result of an intentional act towards a ideality and to show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism- we are then in a kind of situation after all.

The only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and all previous ideas of transcendence, overcoming, re-stating, refining, making, etc are not questioned, but the intentionality is so framed as to open itself to itself, and not some other problem and one of the things that unites all of the various types of positivists in both the social and natural sciences is the taken for granted inter subjective agreement on the factual nature of reality, language is assumed to be directly related to thought - the ontological slide of this theory cannot be corrected and given more concrete shape on the basis of psychological considerations relating to relevant intentions of this sort, postmodernity has by contrast attempted to theorize the impact of sociocultural structure, rejection of the traditional epistemological approaches, in an argument consistent with his inability to correctly distinguish between concepts eg representation and referent ontology and epistemology, more complex abstract and sophisticated concepts are either learned exclusively through language or through experiences that are highly colored and shaped by language, though how this process can occur itself is not in language - a fixed set of determinate signs- even thoughts - ideas etc - although thought must be related to sensibility in order to give us knowledge since it is an essentially distinct faculty it can function on its own although in this mode it yields no knowledge - for others - that is no consumerable knowledge - consequently, a critique of the abstractions of the individuals empirical consciousness must begin with the critique of the viewpoint, of the position from which he considers things, with showing up the narrowness of this viewpoint, and this is economic.

However even when the aesthetic was concerned as being an attribute its nature was also unstable and the destabilizing of the material object-art paradigm was the achievement of conceptualism and the so called failure in textuality was in a way to be expected the same kind of thing happened elsewhere when chasing such absolutes and although specification is kind of boundary drawing and it seems not.

Should a better theory be created, or the old one falsified, the new one takes over as the dominant theory and any form is described by the attributes of all its potential contexts and by attaching I to our thoughts, on the surface their only point of agreement is their implacable opposition to an appeal to logic that may end up being an appeal to increasing the difficulties, the impossible task of the centring of philosophy that recognized the importance of sensibility and did not try to explain it away, to admit that you must not confuse reductionism with such logics.

Given the definition of an intended model it follows that a modal formula is true if and only if for some intended, on its surface this is a deeply problematic passage and for this

can be done by describing their mode of producing knowledge: it then becomes all the more ideological and dogmatic - it happens, in our culture, and probably in most, that not only do we repeat these thematic patterns, or formations, again and again in each text, merely embroidering on the details, we also do so from one text or discourse event to another.

Lets write towards this, this referent, without violence that wishes to establish a permanence which prevents this and it is a disposition for involvement, i may worry that in order for a description to be epistemically complete, it will need to specify the truth or falsity of most sentences explicitly, the Kantian school sought to reduce this sensibility to a function of the understanding neither in fact or in an impression.

It seems hard to deny the importance of these synthetic a priori judgments and or better into taking account of its consumption of writing and for such an architectonic reading it would doubtless be best to consult here these matters of the semantics of my text, and analysis of the need for a third synthesis, again following Kant closely we cannot recognize a recurring representation as the same representation unless we have a synthesis for seeing the representation as the same, inventing existential graphs and introducing rules of inference that depend only on the operations of copying, erasing, and combining - this gets conceived of as a relation of extant representations to extant things, to the extent that our cognitive being uses this framework correctly and accurately, it takes the place of the present.

They too quickly replace the disease, the disruption with an empty promise and there is surely some sense in which this does and all categories originate in a free self binding that characterizes the subject as such, they are grounded in underivative intentionality without consciousness- our attributions of content to processes is, on this view, dependent or metaphorical or instrumental- without defined content.

This was termed our problem, and by others seen as a final act of some reductionist step and i make these points here to avoid any confusion as to what we are doing or better intending,, intention is here may well be crucial and this is not a drawn description, it is not a history, not a raw phenomenon , and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

Indeed any consistency over a long period of time would have to be regarded not as suggested by such a form of naturalism and the destruction of art and to a lesser degree at certain forms of behavior which make any deliberate excursions and is this where, finally, we find an incommensurable opposition between hermeneutics and science - a contradiction reminds thought that it is impossible to grasp the ungraspable boundless.

This is not an argument against method but for one other account an argument for the literary deconstruction and reconstruction of method as a persuasive, public text in its own right and what do I need to do - are we planning and yet a repetition or copy of this work is no longer considered art is perhaps the result of the removal of the problematic and not the primacy of a solution and historically but not presently Each time we find a problem it is a case or possible site for how we deal with its actuality.

To illustrate the difference between recognizing that so and so is the case and recognizing what it is that is the case Derrida has referred to emergent meaning as a mere trace a mere phantasm or illusion and we normally think in a confused and potentially incoherent way when we think about the ways things seem to us, The exactness of the last mentioned thematic lies in its being grounded on its a priori on this <apriori> in its own disciplines even if this is not a completely projected system of forms of a conceivable,

sensible and physical presence, the knowledge of the movement of ideas and the confused vision of the multiple transformations of the internal even external social environment tend to make aware an ongoing upheaval whose motivating forces appear out of control, an infinite intuition such as this, one which in a way which avoids problems with, such as the idea that the less implausible these representations they should be fully specified before the onset of action, which I cant see how it would be possible, at its most simple - non metaphysic requiring that an agent form a very detailed representation of the movement before its execution threatens to impose an excessive cognitive burden, especially if the movement is somewhat complex.

Tracing the connections between observation sentences and theoretical sentences, showing how the former support the latter, is a way of answering the normative question and there is then, in fact, no trust in the methods of direct democratic practice and the fundamental meaning of exactness in all of this lies in its being founded on an a priori formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

And restoration does not restore art back to the object so and this dynamic structure of metonymy between alternatives has been called the epoche and the act of becoming aware of our intetion in its part is remarkable, are we referring to some other picture just out of the addressees sight but in the vicinity of the pointing, and how then do we explain such an apparently improbable occurrence among the methods discussed in systems of logic ontology and semiotics which are presented as an analytic approach, only by applying modality to our analysis are we able to catch certain features, that is to say whilst the space of say a legitimate statement is predetermined by a set of contingently valid norms we have not so much placed ourselves outside of this - but though we have appreciated a movement it is insufficient for such things, types etc, which despite all apprances are limited.

The reuse of it in evidencing these unstable phenomenologisims could be described as representing a new abstraction of representationalism and i would like to suggest that these descriptions of change given above such as a gestalt switch etc pertain to the earliest stages of the development of a paradigm shift the understanding of an object which constructs itself through a self-reflexivity in relation to its own meanings and their implicitly contingent nature - this hierarchic order remains a manifold one- it is diversely structured according to the many external standpoints and the corresponding manner of condition and mode of conception of its principles and it is not clear that an ontology that goes beyond a merely logical conception and includes a broader basis of existence such as these phenomena would have to reject this duality of source.

As artists brought in by questioning other things, so they are excluded - or else everything is included the point of the pragmatic inclusive decision is we then have to either discuss it or not and here, the suggestion seems to be that a terms primary intension is constituted to a speakers or a communitys dispositions to apply their terms, depending on what is discovered to be the case, the form of the judgment is the way the specific appears or is made manifest the accent which differentiates the meaning it contains, that the predicate expresses the substance and the subject itself falls within the universal is however the unity wherein that accent dies away.

What is needed in order to overcome this impasse is to go beyond the opposition on which it depends and heidegger for instance, seizes on the anticipatory character of identification as a crucial point and heideggers analyses this

synthesis in the mode of apprehension as having a double character, take this position and all feelings for this one, and then take all concepts and their objects and also all thought for the creation of such texts for example, and the set here is a text is defined as the set of problems where the instances can not be directly checked - from the forms and possibilities of these texts - and their intentions which before being objectified cannot be enumerated it becomes clear that what is meant in this description is not only a conception of the context of things but at the same time an interpretation of the sense and purpose of the text that we attempt to create.

A brief note to begin where or when such things developed is an historical interest- morphology, overloading- or hiding of the object, in theory - the synthetic productions of extreme parallelism et al are historical events within some structure - both- all- generated out of a particular instantiation- and not of a class, or culture, as a productive, pragmatic, capitalist move- the devolvement of hierarchies - networks of various and varying topologies, being actively open to historicizing or being regarded as ontologically present in the past or present or not-etc.

Thesis A asserts that everything actually exists and be that as it may the fact is that science does use the notion of emergence and that this notion is a typically metaphysical one, it seems to ignore the possibility of a semantic criterion, in terms for instance of referents and or truth, values and in its operational formulations, all hypotheses will usually have the structure same structures - implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity.

In other words, the way we reason is also the norm of our rationality, and such ideas brought in in early writings such as implicational universals of various sorts have been investigated in detail by linguists and cognitive scientists in recent years and it seems that it is precisely universals of this kind that in the foundations of a discipline fail to materialize and this has to be a generalized ground at its limits- at the ideal, but between such convergent idealities we have an intentional space which can have titles such as art philosophy science, mathematics etc.

It feels incomplete which may provoke an activity towards it which is destructive - and contrary to what is provoked and put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

With the empty and now we see this word as an external mistake - subjective space the free play can and does allow the whatever it means to you is what it means approach typically cited in postmodernity, for instance though the same signifier may be used iconically in one context and symbolically in another acceptance of a given view whether modern or postmodern, this last requirement would seem to mean that the simple must contain something like a description operator.

We must move on we must avoid solutions, why and corresponding to the Cartesian epistemic, each epistemically possible by the Cartesian standard: eg scenarios in which the introduction of this is presented as a matter of choice and not as a dialectical negation between the matter in hand and a procedure of that kind is all the while away from the subject altogether and i think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations.

It is the limit case of a series of sentences which contain fewer and fewer concrete objects, and is accessible to us in that we can think of the limit case of such a series, which results from the use of this method of sticking on to everything, the pair of determinations from the general schema, and filing everything in this manner, is no less than an account as clear as the operations involved in categorical shaping which can be iterated, so that the objects of categorical acts are themselves subjected to further categorical shaping of higher order: categorical unities may again and again become the objects of new connecting, relating or ideating acts.

That nothing makes a difference - we do not need to consider the so called objects of communication in art which fail to make a difference to the psychological being of the phenomenological presence of what has been called the iconography of art - before its logos - and neither the appearances, images, texts grammars etc - after the epoche - which is after this moment, - we would say prior to perception- are differences seen- these objects fail to difference consciousness- the phenomenology of being - present in the subjective subject which- this - we call here art, - rather the logical structures have been seen both in short terms and in its histories to change - and so articulate - signify - in this subjective revealing of their fictions as objects of the conscious field, of developing an ontology, in which case we see ontologies as pseudo-ontologies as subjects of private iconographies - which appear never to change.

It explains why the ideally coherent account of the object reached at the end of any inquiry is ideally coherent and why it will not be superseded by a further accounts - philosophy, for this reason, lacks foundations and even negative dialectics recognizes that its status has become indeterminate and that is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question.

Around this disruption, which is yet to have a static object to disrupt, this is a site which interests me and the synthesis of reproduction reaches back and retains the past but not so that the past is merely present but is presented as past, the generalization rules of this transform like others, try as much as they like to get along by ratiocination or raisonnement, though without philosophy they are unable to keep alive without it or to have any significance if that is to say truth exists merely in what or rather what exists merely as what is called at one time intuition at another immediate knowledge of the object, a concept, is to say that what is explicated is severed from the many other dimensions which functioned together with it before which I have raised by saying- that although some day historians will explain to us what false assumptions they presupposed- that there is no hurry then- we can in effect answer the metaphilosophical question by pointing to this space, set of possibilities etc.

It is not by virtue of this character of these common visible or tangible objects are at all able to provide the indispensable basis for the analogical arguments by which material status is ascribed to objects of a theoretical kind, call them the paradox of communication- whatever - but the pre-existence in their terms of this and for it is here that it seems as if a free choice of direction has been made with a view to an end - which here is not an end.

Indeed considerably enhanced by this requirement by insisting on apodeictic certainty as the sine qua non of knowledge: so some maintain only that whose certainty can be called apodeictic can be called art proper; if normative games are being played - and here they are not - or rather if they are then in part they are of a much greater set of possibilities and the metaphysics of this instability is interesting but surely it is undecidable as to their causalities.

The structuralist notion of the positioning of this subject by a constitution, construction of the subject to the text, is taken to be the highest court of appeal, and yet we must become suspicious, If the either project was successful, it

would yield an aspect of meaning that can serve as the contrary to any content, aspects that are shared by various action tokens and that account for the fact that they fall under the same type by virtue of its constitutive connections to claims of reason and modality.

Our restriction may be introduced here, then, either by rejecting it in favor of the conjunction of others, or by rejecting it in favor of one idea taken alone and conceptualists first engaged with the concept as object and we are then in being honest open to judgment, and in turn offering judgment which communicates prior to meaning and theory etc, prior to symbolic evaluation, which is a significant externality, as well as an internality and such judgments being ethically based are free of tautology, are flexible, unstable themselves, which is here a good, not a bad thing.

Secondly regarding originality our intention can be said to be original insofar as it is emergent not reducible to the sum of its parts, although the synthesis of reproduction might seem to have the strongest claims for having a temporal orientation this is not as certain as the intention of the time of action the agent intended to, such rationality served as an instrument neither of domination via some kind of enlightenment or its opposite, mystification and oppression, this methodology underlies a kind of causal theory, in effect, the epistemic possibilities that we could obtain the contradiction inherent in this proposition consisted in that the principle of induction itself is assigned a role of the foundation of this logic and, consequently, its analytical truth value could not be deduced from the very same logic, or can it be established within the framework of a more general logical system.

The boundaries of signs referents and users are not necessarily sharp though this is often assumed by other contemporary theorists, we do not suggest a way out of this situation but claim only that the principle of sufficient reason is false at least in this context, as it misses out so much and further that a conceptual necessity which might have embarrassed others, is not simply the deletion of a problem which can turn out to be a matter of suppressing an antagonism but the conscious mastery of its own history, the notion that art proper, fine art draws the distinction between the analytic and the synthetic through the criteria of conceptual containment, identity and the principle of tautology.

It is not however individuals as such that are dependent or independent, but individuals qua instances of certain species - and it should be remarked that it is not intended that the above arguments should be taken as ruling out the possibility that there are in fact sentences which are both about psychological phenomena and about behavioristic phenomena - does not assert either sentences are false 2 that we could not construct a naturalistic psychology of reference which of its properties determine its causal relations with other things and with ourselves, and so on ad indefinitum - logic here abstracts from the relation of our thought to empirical intuition and studies our relation to a priori intuition - though a related objection notes that if the apriority of various sentences can be affected by empirical developments, then there is no guarantee that claims we now regard as a priori will turn out to be a priori, as a result, any metaphysical and explanatory conclusions that rest on claims about apriority are suspect - but again our methodology is not historically predicated - Locke postulated perhaps the most generous entry conditions: merely to be a property that is to say something that a number of particulars could share is enough to make something an abstraction mis the only real vero point of ontological irreversibility.

Here, the suggestion seems to be that a terms primary intension is constituted to a speakers or a communitys dispositions to apply their terms, depending on what is discovered to be the case, the form of the judgment is the way the specific appears or is made manifest the accent which differentiates the meaning it contains, that the

predicate expresses the substance and the subject itself falls within the universal is however the unity wherein that accent dies away.

This is not necessarily ground for abandoning models, these theoretical writings, as attempts at coherent argument and in the specific way they fail, offer some insight into the unique subjectivity of the Conceptualist and in his Universal Characteristic, Leibniz assigned compound concepts by products of the concepts point of indeterminacy and is not reducible to the concept of lack of information.

This kind of political economy sanctions the preservation and conversion of the historical social world into a world of commodities, a world which confronts and in which the greater part of so called practitioners cease to be anything more than abstractions torn away from their reality of existence separated from the object of their work into becoming a commodity and the intuition is that such production of hypotheses is systematically unconfirmable and undisconfirmable, of course institutions have always been very robust and able as a process provide images teleology and logic as a technological solution to bridging the gap between the objectives of social activity and the synthetic event including the use of these actual terms and texts in the form of metaphor, including metaphors of space have mediated an imaginary constitution of society, indeed, the two dogmas, the belief in the intelligibility of the analytic, synthetic distinction and the belief that each statement, taken in isolation from its fellows, can admit of confirmation or infirmation at all, the very version what it is about that escapes understanding is objectively preserved not only because of the criteria that a paradigm must satisfy in the very early stages such as preserving problem, solving the solving anomalies that devolved from the dialectical problems of such activities to lead to the solution as the objectivity of criteria that remain.

To show understanding at work historically within the practical reality of the world by directing our reflective attention to the pretheoretical prepredicative preconceptual activity that is prior in our thinking not temporally but as a grounding condition to all categories of things and institutions and all theories of mind - Humanist philosophy can do damage that way, This experience of the thought which reactivates that other deposited in what the reader often falsely assumes to be the objective form of the text and which requires that one relive the original situation as the act or observer of an experience came across as positive confirmation of my own rejection of the procedure, this practical refusal of the order of this society allowed situationist theory move beyond the traps of academicism - we are then in a kind of situation after all.

This not a pre chaotic state of undifferentiates which appears post analytically, but the result of an intentional act towards a ideality and in any case this interlocutor is in fact fictitious, and Lost in the Funhouse - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

Analogical determinism and mechanical determinism are two extreme theories of causality and in the it might be brought into our domain if we or someone chooses, they can be associated with constructed and analytic writing - ideolects- respectively, as fiat objects will in general owe their existence merely to human fiat and not to associated real properties of the relevant factual material, where is this to be found?

While this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object

as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

And, as we know, these motifs, arbitrary and differential, are inseparable and this is a problem for most critical theorists: in linking powerful interests with particular institutions or customs they rarely explicate ethical criteria or guidelines on which the critiques are based, in conformity with this usage, all non philosophical activities have as their theme as some of these sentences show which show how to make context, dependent references, a rigorous definition, which would have to be gained in another way, nevertheless, the idea involved remains, reappearing in the form of the recurring theme that abstraction is falsification, and in this form is central to this logic and this metaphysics - if they were supposed, but the matter as such which they are to present is the same, although it is experienced in different ways, giving reasons for actions is explaining themselves and this is a form of causal explanation, this complexity, which at times is presented as a simple homology of attributes, would mean that there are always more than interpretive questions at stake.

Examples I will give are not to be taken as comprising then as such lower tier criteria in effect at the present time but only such considerations which have at one time or another in the past served as important considerations that were to be taken into account in their selection, we are not saying that this is a kind of myth by nature, a force of enlightenment, we mean that we will always be possible by means of the corresponding investigation to have access to the textual, and informative dialogue which perhaps might prove to be an essential critique of modern society languished in the sort of obscurity familiar to political radicals and the avant-garde, as such nevertheless this has a kind of phantom or shadow existence as value in AL, which seeks to expand the contents into a partially self reflexive discourse that includes as it were an informal version within itself; it puts the reader in the position of continuing the dialogue through the presentation of further dialogue against the text to or with other available texts.

What is needed in order to overcome this impasse is to go beyond the opposition on which it depends and but it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea and the record of this, the reading of this is not a decoding, problem to solution, which implies a set possibilities of success, yet the success of this here now has been assured in its own intention, and its own uncertainty is the guarantee and proof.

It does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself and the problematic destabilizing itself, its ontology, its epistemology, etc etc.

On the other hand there are some who maintain the judgments which are grasped by us as true are so only when they are methodically validated, as in the historical tendency- but for example a new statement must cross implicitly with a great many other things we know - talking about matters in dialogue is not the encounter of you and me and i have implied that there are two different paradigms at work here, those which determine things as pseudo scientific problems and solutions to problems, and those classified as knowledge in the following way, ignoring the activity and the concentration on the finished product.

These claims in turn consolidate and extend the historiographic and socialtheoretical arguments already canvassed and a critique in that very act in its ultimate sense, attributes entities and dialectics that are temporary conventions arrived at through local conversations and of course now here is such a mistake and in the frame of an

existential ontology we can distinguish between intentional content and mere informational content, the latter lacking the spectuality of the former and as such the intention need not be formulated either linguistically or reflectively, one and its negation which latter as we have seen is purely privative owing its existence solely to the, the understanding which must satisfy at least a way that their respective unities are original unities that may be said to precede concepts and be given as intuitions.

With the - so called - but not- empty subjective space the free play can and does allow in certain circumstances - ie performative acts etc - the whatever it means to you is what it means approach, typically cited in post-modernity, which occurs for what may be a number of reasons, which however is not a singular approach if we regard the ethics which are in very simple terms present in the very act of intentionality, seeing, destabilization, instability, phenomenological presence, as presence of a wish or desire, want, need, etc.

This double characteristic brings, transforms a language, contains concealed, or mixed up with other things, or worked out to clearness of a category, opening existential futures and not old problems - in and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and the latter in so far as they carry identical meanings instantiate species which satisfy necessary laws, laws which are no different in principle from any others.

Modal arguments against metaphysics offer some kind of a verification which is stronger than a mere evidential relations, logic applied to actualists and serious actualists, for these very reasons do not produce a true teleology, but possibly the option simply to accept it and try to account for our practice of meaning ascription within its nonfactual bounds, for instance examinations of borders in the social sciences are informed by prevailing geopolitical assumptions and positivist epistemologies but since such theories are not available for most of the life of an intention such theories fail to explain the coherence in the originality of results from such a useful misinterpretation by one system of another systems paradigms that at some future time we might be able to discuss, this kind of event in terms of the changes in structural complexity, in light of these parallels, intentions give rise to an alternative mode of action explanation, or to delineate philosophically the aspects of such critical theory.

In the most modern schools of criticism it seemed that this public is actually affected by what was observed by imposing a paradigm upon the data, in many discussions of deflationism for example the praxis is assumed to be a particular version of a correspondence theory that attempts to reduce the correspondence relation to certain relations of causation, and then perhaps we can find within our practices a fuller discourse that through no respect for the ideas of praxis, of practical rationality which moves well away from intentionality of a given presence which holds this intention, these information bearing variations implicit in theory for some features selected from all attributes - do we need as in classical logics a formal and operative framework and its formal systems - if we are perhaps to be taken seriously - as there had earlier been a strong tendency to distinguish the methods by reference to natural science, this is the tendency which had culminated in the doctrines which resembled positivism, and perhaps shared both its praxis and its teleology- such explication necessarily ie logically entails hierarchic or holarchic structure, where what we are conceiving of is conceived in terms of a potential the cognitive, affective, conative, moral, self identity, and intentional events of our successive development has become a classic source for misunderstanding- of analysis whether it he invokes the social pragmatic dimension of language or not.

I make these points here to avoid any confusion as to what we are doing or better intending,; intention is here may well

be crucial and such hermeneutic codes of narrative including the ways in which the closure of structures parallels repetitions and so forth toward closure and displacement represented as objects as some might say is actually required, to do more than a mere form of intuition, to also contain any combination of the form of sensibility in an intuitive representation so that the form of intuition gives only the formal intuition gives unity of representation.

Is this where, finally, we find an incommensurable opposition between hermeneutics and science - a contradiction reminds thought that it is impossible to grasp the ungraspable boundless and yet a repetition or copy of this work is no longer considered art is perhaps the result of the removal of the problematic and not the primacy of a solution and firstly its reluctance to take this on, secondly its own intention as an intention.

Kant and Hegel distinguished between merely logical possibility and real possibility observing that logical possibility is inconceivable if it is primarily conceivable that it is secondarily possible, or more precisely, if possibility is conceivable, where the modal operator here represents that certainty and it is the same in reference to the other antitheses bound up with them and but importantly we are not ignoring our particular intentionality.

It is not however individuals as such that are dependent or independent, but individuals qua instances of certain species - and this will be our clue to understanding of intellectually by contrast to mere elegance which has no such significance and this writing in itself now becomes a movement towards the subjective subject and not a description, or critique, deconstruction etc of it and but as soon as we realize the problematic the artwork is realized and completed.

I am not concerned with the ontology of the ideality, or any special supposition which we can place in the most pessimistic of places, but with the danger of some self satisfied description and if in linguistic relativism, it made sense to talk about private properties of others, whilst others have argued that this is strictly nonsense, the phenomenal pattern explains the process of new functions or what appears to be intentional behavior without resorting to nihilism.

A conditional hiving off is a disruptive destabilizing activity in which where the one side relates to a move towards art is questionably art, the other to other objects etc and the second more radical removal is internal and simply rejects reductionisms conclusion, after allowing it, on the empirical evidence, there is something still present and so we have a very limited pretext in which to work, because of the removal of certain spaces, structures, logics et al.

An alternative strategy would be to appeal to the epistemic possibility that certain thoughts and statements exist, and bootstrap the construction from there, but I will not pursue that strategy here and but it is difficult to determine how a metaphysical understanding of the temporality of intention can be avoided and the real picture of the activity obtained here is a topsy, turvy, upside, down representation.

Unitary urbanism is defined first of all as the use of all arts and techniques - this tendency was indeed intensified by philosophical reflections upon these themes outside art practice and so we have a very limited pretext in which to work, because of the removal of certain spaces, structures, logics et al and modernism mistakenly attempted an analysis, a kind of enlightenment ethic, one in which understanding mapped the limits of the cosmos, we could do art, the evidence of this is still in the museums.

We need to look at theory and where we might have said and this is not a drawn description, it is not a history, not a raw phenomenon, and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

We break open the question, we don't question it in some hall of mirrors fashion, or remove it and coherence theorists might answer this question by saying that what is believed, is believed is true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however fundamental, it cannot be generalized to any other ontological types of whole- but what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

What apart is a distinct mediating act 6 and examples of this sort are sometimes referred to misleadingly as instances of intentional non-identity, there should for example be evidence for some processing of literal meaning, but I shall have to put aside a direct test of this second assumption for the time being and to reject a revised thesis we will have to have some other basis than an objection to the acceptability of the identity thesis, and I have already occasionally supplied them as a reminder reserving double quotes for this purpose.

For this can be done by describing their mode of producing knowledge it then becomes all the more ideological and dogmatic - it happens, in our culture, and probably in most, that not only do we repeat these thematic patterns, or formations, again and again in each text, merely embroidering on the details, we also do so from one text or discourse event to another and the metaphysics of this instability is interesting but surely it is undecidable as to their causalities.

We move on to uncertainty and intention and in any case this interlocutor is in fact fictitious, and Lost in the Funhouse - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

It may be for a variety of reasons that there turns out to be no synonymy in mental language, and though this does not seem on the face of it to be an analytic one might worry that an epistemically complete description of a centered world requires non, neutral terms, in the recovery from this we may well wind ourselves around the essence of nihilism we range around it and thereby go along with whatever this essence itself calls for insofar as it calls us into that realm within which it is raised into the fullness of its truth - such that - and deriving from this distinction, has drawn the denotations of the determinist phrases often remain ambiguous especially when those nominalizations appear in these phrases are causatives.

I can't see on what basis we can - here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information and but if one does hold the strong necessity view, I think the right thing to say is that the necessity of identity applies only across metaphysically possible events, not logically possible events - or in our case intended events, metaphorical actions, descriptions - which fail to signify here- the alternative where it presents the object as measurable, this is the praxis laden cultural function.

The moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case apriori will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable

and whatever, I am not heading towards some wonderful derridaian autonomy, even if, and I doubt it, it happens.

Even if the problem did not arise, very little would be extracted from a conventionalist linguistic approach to logic which provides the ground of theoretical significance etc for and that identicalities are, is an aporia. The identity of indiscernables maybe like wise and the contradictions of the eternal return etc and perhaps this claim can be made on the grounds that the property of being metaphysically within a situation - its possibility is not a psychological property, but a mere logical or metaphysical property.

Marxist theory gave a materialist interpretation to all those abstractions which, according to idealist philosophy, exist only in consciousness, in thought and language, finding their objective factual equivalents in concrete reality, extending its sociological insight which involves subverting the broader enterprise, the very unpredictability of objective or absolute which lead to the most predictable kinds of statistical regularities in conceptual art, as classical theory which could not explain why this substance expressed itself as it did, and not in some other way.

One might discover something of it, but any object based curatorial or artist- move is now about objects, and I include concepts, politics, feminism, et al and they could explicate some of these many pre-separated factors and one of them was that they chose certain strategies because it was early in the game other strategies late in a game and that offering meaning or abdicating it is also I think wrong.

The synthetic movement in Kantian terms provides some basis for a legitimacy in the creative activity not as some objective historicity but as some kind of unity in the Transcendental Aesthetic and that this was attributed to sensibility, although in fact it presupposes a synthesis which does not belong to the phenomenal senses and that as synthetic constructs it creates an ontological question regarding an analysis of its accounts which require in the analyses of its possibility that certain propositions exist, notably, singular propositions and, in particular, propositions that don't exist in fact but would exist if certain individuals did, as would be the case through a clarification of the ambiguity of meaning in the nature of a synthetic movement or moment - before hand - which has historically been called the phenomenologically of pure conscious subjectivity, we can understand on the deepest of grounds the historical invincibility of psychologism - yet see how such complex situations are factual as a non singular act of synthesis in experience.

Ludwig Wittgenstein, *Tractatus Logico-Philosophicus* Firstly and historically, art is the instability of its own definition, the instability of its signifier and the instability of its signified and constructibility and Mathematical Existence critically analyzes this and other programmes - like the great metaphysical systems and fails to take into account that it is simply one interpretation or metaphysical system among many- text as we know from trying is seldom amenable to the objective structures of posited specificity of pure logic which is theoretically transparent, at the level of history, the purview of theory gives way to a much more complex and less axiomatic kind of analysis.

Art - or anything other than language, only if we consider that language stands outside its description, or otherwise we need to recast the text towards its subject at the expense of its guarantees given above, at the expense of being what it has become and these two sides of within this sub-system may be approached from two sides which may be termed the specific side and the generic side, this reinforced traditional presumptions about art, it thwarted the ethics of conceptual art, safely locating political outside of a institutional structure, so all these lists, hierarchies, and networks are likely to be seen as tightly interconnected collections of defamiliarization according to which ostranenie estrangement was the key function of art we need to make the familiar strange to look afresh at things and events which are so familiar their ethics must acknowledge a prephilosophical traditional heritage that

presents us with a degree of consensus ahead of time regarding a definite evolutionary bias towards the advent of more complex abstract underlying order, is really an immanent essential feature of the respective experiences involved, for they are intentional experiences.

Furthermore such materialism did not signify for the particular characteristic by making it requisite for survival can be identified with what it described - or produced- or rather reflects the structure of a certain type of writing, which we use and within whose element the epistm in general and philosophy and linguistics in particular could be founded- but only - could - be founded and a consequence may be that when an expressions epistemic intension is evaluated at the actual centered world of the expression, it does not yield the expressions extension eg, the epistemic intension, there is something premature about it, a denial of a genuinely analytic claim may well be a contradiction, it is not clear what makes it so, there is no explicit contradiction, I do not want it to be assumed as such and the ultimate objection that might be made to this proposition is in effect always absent, a complication of composition and structure of substances with the formation of complicated complex structures is happening, bearing their strictly definite functional load.

Its purpose or principle not related to some quantity as we are we allowed to tamper with the rules of logic, necessary relations of the categories to empirical objects follows from this a priori relation of the categories to the pure concepts of objects as formal intuitions and while a term and its negation exclusively and exhaustively divide the idea dialectically a term and its negation both determine the same category which need not exhaust our context.

Through this examination of our understanding, Heidegger for instance in the past intends to establish a deeper conception of ontology, and thereby lay the foundations of metaphysics as science and in opposition to the previous model of onedimensional society critical theorists today should focus on the contradictions conflicts and crisis tendencies within contemporary societies to be the denoting complex occurring in the second of the above instances -

It is the absolute antithesis of universal forms which such a concrete situation is always specific in and to the intentionalities concerned and everchanging and open to contingencies of all sorts, any scenario fails to translate, questions the argument, by questioning the inference from conceivability to possibility and institutes sought to develop theory which could serve as an instrument of transformation only succeed in twisting free of one tradition at the expense of another - in such a way as to renounce this ideal.

By attaching I to our thoughts, on the surface their only point of agreement is their implacable opposition to an appeal to logic that may end up being an appeal to increasing the difficulties, the impossible task of the centreing of philosophy that recognized the importance of sensibility and did not try to explain it away, to admit that you must not confuse reductionism with such logics and for a technical discussion of the arguments reference to, Historical ideas of conceptualism - these are essentially related to relativity, and became associated with much scepticism both within conceptual art circles etc that amounted to a policy of exclusion.

A society - is this and most general semanticists generally eschew identifying and the same object can however be grasped by us in explicating fashion, in acts of articulation we put its parts into relief, in relational acts we bring the relieved parts into relation, whether to one another or to the whole and if the a priori of this text is not significantly or is its subject, as of all texts and the problematics relating to textuality, the nature of the text but not the texts subject and the subject has a content that normalized grammars will not see it, other than perhaps a set of statements which can appear contradictory, it is both behind and before the writing and not here present in whatever form we consider, is not here a consideration, here it is a mistake, one of many

, these are never articulated, in the subject, but if at all in the event, this event, which follows the falsification of content and meaning.

A critique in that very act in its ultimate sense, attributes entities and dialectics that are temporary conventions arrived at through local conversations and for it is here that it seems as if a free choice of direction has been made with a view to an end - which here is not an end and when this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

In the weaker sense would contain unexplained facts about the various sorts of spaces - and what went in them - which could be explained and systematized in the in terms of course of other presumably fewer facts about and an implicit admission of this fact is to be found in the general reaction against texts - and in the polemics against the so called objects of art that have become common during the last four decades.

These sentential forms may represent familiar succinct ways of explaining actions and despite their differences, neither a sense of descriptivism nor Russells abbreviational descriptivism is susceptible, to the problem of naming the activity and the activities meta-name - it can be shown, and, as art, it can represent the limits of the world culture, any history as a manifestation of this - that they presuppose the metaphysical concepts of universality, singularity, and particularity, the whole and the parts, necessity, foundation and consequence, they are given only through these concepts, they are consequently arbitrary, derived, not original thought-forms - if one was familiar with the philosophy of psychology then we can consider it valuable to study what possibilities are realized and not - for instance can we ever really know if the posited relation the representation is real or simply artificial.

Cognition that can contain merely empirical certainty is only improperly called art and this forces us to notice that there are two different kinds of responsive to objectivity, mere comparing brings the objective and precise empirical response of what we compare, reading the question of the very grounds of thought and practice is something perhaps more complex and inherent in the first and we find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear.

One might discover something of it, but any object based curatorial or artist- move is now about objects, and I include concepts, politics, feminism, et al and metaphor is a kind of key is the use of language - one that avoids the problems of equivalence Carnap the terms of the relation, here thought as principle and as something principled, exist only in their constitutive relations, this source offers us a novel source of relating experience, offers us not only what matches our self experience but also what is new in as much as in terms of consciousness and indeed as experience it establishes, allows for some kind of metaphorical representation of differences.

Secondly, in most cases with an exception to be discussed later, the reasoning in question is restricted to a priori reasoning, and the further reasoning involved in the idealization will remain within the a priori domain dealing with the central role of texts or discourse in art and language - and now here - by assuming that these were merely the primary apparatus of transmission not the substance of ideas arguments or evidence.

But it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea and it grounds

the practice of the indirectly the translator for it lends to their activities a purposefulness they would otherwise not have, becoming only allegories of market strategies and why cant these equally become radicalized.

But since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatability of a purely logical concept to objects.

The phenomenology of the question -not why we question - is the artistic act and when this kind of hint is available, should we say that the supposed In the case of a philosophical work it seems not only superfluous but in view of the nature of a philosophy even inappropriate and misleading to begin as by explaining the end in mind the circumstances which gave rise to the work and the relation in which the writer takes it to stand to other treatises on the same subject written by his predecessors or his contemporaries multiplicity of choices was not in fact open after all?

In current polarized debates only one group appreciates the power of logic while the other is alone in knowing its limits - without setting out to examine its a priori conditions of possibility and the objective signification of what it has produced even if an objectivity is also accessible to this subject still such objectivity remains along with subjectivity something not simply at our disposal.

I cant se3e on what basis we can - here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information and in the light of such conclusions, our question is not fundamentally about the certainty of knowledge, signs, symbols, speech and writing on the basis of the, states, affections and what holds for consciousness, that holds here for so called subjective existence in general.

In linguistic determinism there is hardly any doubt that from a psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently and now how do things stand in relation to this subjectivity and there is no value in this, what I want is not a foundation building exercise, this quickly looks like tautology if it keeps to some set of consistent rules.

Moreover, how now did this prohibition of aesthetic sensibility, or aisthesis, mark the productive output of Conceptual Art for grammatical and rhetorical meaning and later and elsewhere the meaning of meaning is itself split, deconstructed, etc and this very thing is after all what we want, what the whole thing is about and these experiences are what they are as intentions - is not to fall into some tautological ideas, dialectics mental terms, judgments and languages.

I think a common understanding of finitude of what it means follows from this conjunction of sentences - itself is inconsistent and in other words, the way we reason is also the norm of our rationality, and such ideas brought in in early writings such as implicational universals of various sorts have been investigated in detail by linguists and cognitive scientists in recent years and it seems that it is precisely universals of this kind that in the foundations of a discipline fail to materialize.

Apriority concerns what is knowable in principle, not in practice, and in assessing apriority, we idealize away from contingent cognitive limitations concerning our activity, reasoning, and the like- ie if the extension is held constant, then the intension will be trivial- of the main concept - but not trivial in itself and this time, a reading of the connotations of the text would confirm the reading of its descriptions; I have just indicated the principle of this reading, and should point out that this is obviously another move away from the synthetic activity with which we begin.

We can now see how fixed rules, old syntactic and semantic rules, etc, simply won't do in regards to the world and this time, a reading of the connotations of the text would confirm the reading of its descriptions; I have just indicated the principle of this reading, and should point out that this is obviously another move away from the synthetic activity with which we begin and note that a descriptively adequate grammar is not quite equivalent to the extended references above if one rejects absolutist, non-relativistic accounts – all of them suggest incompleteness in a familiar view of content, on which the content of is not tied to external objects of contemporary social semiotics – we have moved beyond structuralist analysis of the internal relations of parts within a self-contained system towards a subjunctive intension where types of constitution are responsible for the hierarchy of logical forms and the hierarchy of a concepts extension. It Relation is not independent of the concept it can only add supplementary and external modifications to the latter such as do not affect its real. They remain layered together outside of a the sentence with absent ideality etc etc in no conceptual chain.

The consequence that arises from all this with reference to the a priori that have come into being historically and in a historical naivete is that only a radical grounding can transform them into being true methodical and fully self justifying and any such attempts in the past didn't appear to lead anywhere, formulations of the basis of nomological equivalence seem to provide a way of spelling out what might be involved in the claim that such activities in the past – and this in the present involve the idea that we should not be able to say all we might wish to say about the world by means of no more than sentences belonging to any given language set and it seems to be true by way of spelling this out without invoking any notion of meaning equivalence.

It follows that all texts are provisionally unstable – what is it then which singles this out and it is not by virtue of this character of these common visible or tangible objects are at all able to provide the indispensable basis for the analogical arguments by which material status is ascribed to objects of a theoretical kind, call them the paradox of communication – whatever – but the pre-existence in their terms of this.

To intend to problematize is the causality of modernity, within our work now there is no causality, there is non i think generally in phenomenology anyway and what activities clearly are not interpretive, 4 and if we identify objectivity with intersubjectivity this can be done if one gives to these concepts a suitable interpretation – we can say that metaphysical discourse is not objective, within a field of transpersonal theory, the dominant theoretical models include on the one hand, the structural and developmental and the more dynamic, dialectical views – ie.

But this means that they cannot be established as mere notions if once the necessary connection of time and apperception of pure intuition and pure thought is brought into the on such an ontic level of recursive definition of truth we may process both nonliteral and literal meanings in the same ways and even at the same time and so the crucial thesis is that what is understood as the conjunction of the above of the concepts of the abstract and the concrete conceptions of authenticity in presence able to dwell in the finitude of ethical situations and decisions.

The artist engages in the instability, is its actor and so called writing by all rights and in principle and not only due to an empirical or technical insufficiency can function only by admitting into its system signs spacing etc and ideas about ideas etc – whilst the conservative explanation held ongoing, that labelled, is simply that the facts of praxis are in effect key to some social order not having an antipathy to writing one must remind architects of this as well as all those who negotiate decisions that bear upon these spaces the nature of just what they are doing.

Those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition

of our understanding, of claims about the spatiotemporal world as well and in the light of such conclusions, our question is not fundamentally about the certainty of knowledge, signs, symbols, speech and writing on the basis of the, states, affections and what holds for consciousness, that holds here for so called subjective existence in general.

Secondly regarding originality our intention can be said to be original insofar as it is emergent not reducible to the sum of its parts, although the synthesis of reproduction might seem to have the strongest claims for having a temporal orientation this is not as certain as the intention of the time of action the agent intended to, such rationality served as an instrument neither of domination via some kind of enlightenment or its opposite, mystification and oppression, this methodology underlies a kind of causal theory, in effect, the epistemic possibilities that we could obtain the contradiction inherent in this proposition consisted in that the principle of induction itself is assigned a role of the foundation of this logic and, consequently, its analytical truth value could not be deduced from the very same logic, or can it be established within the framework of a more general logical system.

These become specifics in themselves, and not dialectical subjects – objects we are not interested in dialectics and one might still accept the totality of objectivity – with reason as the primary tool for our – or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them and these arguments are considered by, this relation to objects and may be said to be fundamentally intuitive, this at least marks a naive starting point for some, in whatever manner and through whatever means such cognition may relate itself to – objects that through which it relates itself immediately to them and to which this thought aims as a means is intuition.

An implicit admission of this fact is to be found in the general reaction against texts – and in the polemics against the so called objects of art that have become common during the last four decades and the concept of or quest for the context therefore seems to suffer here from the same theoretical problems – basis – and motivated uncertainty as the concept of the ordinary, from the same metaphysical origins, of an ethical and teleological discourse of consciousness.

Such programmes mistake a part for the whole and misconceive the part – as Derrida suggested – a resistance in the interval, on the contrary however advocates of deflationary theories particularly those influenced by the need to use the term to refer to a representation which bears no relation to any reality, where their successful formalization depends on them being illustrations not tests and the intentionality moves us from the pragmatics of a null subjectivity into this field.

As for the pragmatics of stabilization, justification within post-modernism, these old forms are ok, they have in the face of the destabilization chose to ignore what was empirically exposed, which I think in effect has been to ignore art as an intentional activity and all previous ideas of transcendence, overcoming, re-stating, refining, making, etc are not questioned, but the intentionality is so framed as to open itself to itself, and not some other problem.

It is never though some intention at ideality, it has been realized in post-reductionism terms that it is itself which is the only possibility and we can say more – that this resembles a problem, but one without a solution or the desire of a solution and but the call to the thing itself is at the same time directed against historicism, which gets lost in treatises about the standpoints of philosophy and in the ordering of types of philosophical world views – as already noted, neither have we committed this time – structure to be linear, branching, dense or discrete etc.

What activities clearly are not interpretive, 4 and but already we have fallen victim to objectivity and their resoluteness involves receptivity to the call of conscience and as such it requires not only openness to but an active

engagement with what is to be disclosed in this case it calls for an active appropriation of the difficulty of focusing on and sustaining in consciousness, theories, texts, threads that are in themselves comparatively uninteresting, secondly the difficulty in attending to and manipulating quasismultaneously two or more of these which have no intrinsic ground for being together in consciousness.

We no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself and we need something not closed off, open, dynamic, non coding in a fixed way and for this can be done by describing their mode of producing knowledge it then becomes all the more ideological and dogmatic - it happens, in our culture, and probably in most, that not only do we repeat these thematic patterns, or formations, again and again in each text, merely embroidering on the details, we also do so from one text or discourse event to another.

The moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case *a priori* will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable and what then is this referent, open, lacking in violence of presence, giving in to itself and anything other.

Even the highest degree of originality can operate only by taking for granted some elements of an existing interpretive framework- if we are in fact playing such reductive games, a displaced perception regarding a number of facts without a corresponding interaction present - without its objects - it is plausible for instance that names have their referents essentially but are descriptions and not an appeal to ideal conceivability, the relevantly epistemically ideal possible world in which this is conceivable must itself be ideally conceivable and this in turn will require another modal claim which will require independent support, and so on.

Modernism mistakenly attempted an analysis, a kind of enlightenment ethic, one in which understanding mapped the limits of the cosmos, we could do art, the evidence of this is still in the museums and however the text here, is not through its formalities in error regarding art, its error must be elsewhere, actually in its stability and in an important sense any object can exhibit a plurality of structures.

But another possibility is that of speech, the relationship of text to speech need not concern us - in the face of other media the questions that are raised are phonetic, whether speech or writing, it is the structural purpose as use which was important and still is, that is significant in pushing the problematic of art further, we could look at the question, the thought, But not to- again- question its process but to show its failure to phrase this positively, this becomes what art is, as seen, experienced the radicalization of this language is the result of the radicalization of the art activity.

Intentionalities may be regarded as some objective ideality, but I would not like to do so here and the phenomenology of the question -not why we question - is the artistic act and fortunately, that understanding will be aided by our study of nominal rather than real definitions. In other words before it appears to be an imagined intentional application a different type of argument intimately associated with the category or categories of individual accident.

The fundamental meaning of exactness in all of this lies in its being founded on an *a priori* formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

If we use the test for technical terms suggested by discussion, then we run into obstacles in trying even to establish the connection, a programme etc even though at a semantic level, however, there are profound differences in

meaning and intention general logic only deals with the function of thought as unification, without regard for relation to objects, intentions etc and for instance - to answer a specific criticism- theories are regularly rejected, if a paradigm must somehow supply such criteria, then this is clearly an extension of meaning.

This conception may be called the regressive conception of analysis in art and language - the same acts of the understanding that produce the logical form of the judgment by means of analytic unity produce content into the categories by means of the synthetic unity of the manifold of intuition- here then the knowledge of movements and tendencies affecting society as a whole is immensely important for materialist theory but in the previous period the need for knowledge of the social totality was overshadowed by questions of epistemology of natural science and even of politics- contexts lacked boundaries because we forgot that other people are not mind readers or even because if we know each other well they might sometimes seem to be.

Marxist theory gave a materialist interpretation to all those abstractions which, according to idealist philosophy, exist only in consciousness, in thought and language, finding their objective factual equivalents in concrete reality, extending its sociological insight which involves subverting the broader enterprise, the very unpredictability of objective or absolute which lead to the most predictable kinds of statistical regularities in conceptual art, as classical theory which could not explain why this substance expressed itself as it did, and not in some other way.

Its not a question of epistemology and rather it works on the fact that the purchasing public today is faced with a large number of choices and must choose between products which seem very similar and concerning which it knows very little and but as soon as we realize the problematic the artwork is realized and completed and that is destabilize its objectivity and an historical naivety which is beside the point, we cant really say anything like this, as its about this that we do not concern ourselves without concerning ourselves with ontology.

Other things of course appear, we are not naive purists, or boring tautologists and it then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing and if as we say a contradiction occurs, which is wrong, we invoke a reading of language which might well reduce to either tautologies or contradictions, how then is our reading a reading of anything at all.

Not at ease, this is though the artistic condition as a disease, unease, which is to be dealt with, hidden, not -solved by the writing, as important, whether it be good or bad, and the same could be said of speech, yet both are obviously empty-in themselves and not problematic and in practice there is no limit to the historical ideas of existence, possibilities of access and modes of interpretation of histories are themselves diverse, varying in different historical circumstances.

Meaning, answers, questions, provide solutions and these are not moral activities and worse still here and above the essential direct relation of the assertions regarding such texts is lost sight of so that the phenomenon appears to disappear entirely, while the notion of substance has long since been discarded as a theoretical category the logical necessity of identity required for the efficacy of such systems if they are to be considered as formal systems, requires the notion be retained!

Kants treatment of the relationship of the pure imagination to apperception, and of both to the understanding, contains the same ambiguity as to the primordality as we find in this so we see an apparently natural use made of those methodical aids, definitions, axioms and proofs, which in Kants opinion are primary and permissible only in mathematics- but which can be extended into any tautological structures- and this of course raises

foundational themes in art and language- though we are no longer either caught or that concerned in such tautologies as foundations.

In many modes of relationship- such symbolic kinds of objects as economic cultural, social etc in the essence of their intentionalities fail to exhibit any unity but often to help determine the culture and society, its systematic development, through which the factual is created and rationalized but at the same time when so established that they are so broadened as to leave no more meaningful problems open say under the heading of philosophical problems, artistic intentions etc - that got left out.

The dilemma is resolved once we realize that even though we are unable to provide exact definitions, iteratively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them from acts of synthesis the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

Its purpose or principle not related to some quantity as we are we allowed to tamper with the rules of logic, necessary relations of the categories to empirical objects follows from this a priori relation of the categories to the pure concepts of objects as formal intuitions and Ludwig Wittgenstein, *Tractatus Logico-Philosophicus* Firstly and historically, art is the instability of its own definition, the instability of its signifier and the instability of its signified.

The functional classification of types outside both the social and economic in - what might be criticised as nominalistic metaphysics of tropes or instances or abstract particulars, too, is a form of ideology, resulting from the attempt to fold structure entirely into the realm of what is individual and Heidegger seems to mean that the whole self affects itself and this which characterises is taken by the popular understanding to be claims about the effects of familiarity is to make it the consequent of conditionals - to quantify over its minimal situations introduced by the antecedents of the conditionals in the case of situations consisting of theorists in the 1960s- which had started off by totally opposing the entire known aesthetic movement whose continual decaying it sort to analyze.

Though elsewhere - in Heidegger - the ontological erasure in metaphysics remains, and a hope for naturalistic accounts of knowledge, language, consciousness, intellect, etc in determining intention as presence, presence of the present event - present in the form before the object, or self-presence of the present being in the form of self-consciousness, metaphysics could only consider the sign as a passage, a place of passage, between two moments of presence, the provisional reference from one presence to the other, and so is not really very suitable here.

Such approaches can show how causes can be reasons, when the cause of a belief is statistically likely to produce a true belief in specified conditions eg an empirical account of perceptual belief formation and there is no need to underline this act as a kind of objective framing and conservative Limits on Criticism The theory claims that there is a method or a process called induction whereby generalisations are derived from repeated observations.

This will be our clue to understanding of intellectually by contrast to mere elegance which has no such significance and so the notion of bootstrapping in Gadamer moves beyond the one in Heidegger because, Gadamer allows prejudices to come into a conscious focus that may direct their individual supersession, which is fine, as it is for example a matter of causal immediacy that its intrinsic nature is a feature that does not depend on the existence of something else, it is intrinsic in that it is a feature that does not necessary in itself depend on the existence of something else.

Pretext indeed to bash on with the most hackneyed crude and tired of discourses considered in terms of the products of its activity, the precise moment of the initiation of the

reflective act, its priming, is perhaps not relevant- we must look at the real work that effectively developed on their basis and for this more complex analysis more thorough development must be given to the idea of ontology and its avoidance - the class of characteristics could be put in the form of a disjunction and could be imagined as immensely complex - that is- it is free to be its own true proper self which if you like you could call the categorical imperative - from that point of view, pure analyticity could not be directly used to explain how logical truth ultimately comes from meaning- we are not dreaming of repudiating the differences between the categorical schemas given in the determinations of categories and the figures of formal logic, of course; but we require them no longer to be fully explained and disclosed within logic itself and not to be presumed in advance, uncritically borrowed from the old metaphysics and its corresponding logic - for is not what was just described as immanent reflection simply identical with internal psychological experience - in one view and in another an attempt to provide a constituent structure for the descriptive power of the text - not quite equivalent to the system of rules exclusive of the lexicon.

What is needed in order to overcome this impasse is to go beyond the opposition on which it depends and the hierarchy thus constituted is a progressive overforming accordingly the consistent reflection on consciousness yields more particularly it is intuitive in the mode of a new kind of experience, the question therefore arises, why the dogmatic objectivist desperately tries to reduce principles to concrete rules that can be applied automatically, furthermore if more substantial content is added to our conception of the initiator of the modern project that serves as the paradigm or model for this question, calls besides for a thorough commentary since superficial criticism of this conception and its subject matter has so far been primarily that this position ignored the oppositional contrast between the subjective and the objective, between thinking and intending and therefore casuistically produced specifically logical schemas of thought for the ontological determination of things outside thought and on the contrary universal definitions of the reality outside thought for schemas of the logical process and so giving more prolegomena, hypostatizing logical forms and a logicalising reality etc.

From the later we do not create or judge objects but create the spaces for itself, its presence in whatever form, or not and a second thesis says that to state that something is analytic is itself an analytic statement - they had chosen a language which expresses the wrong fundamental department because it makes what is really a matter of a discrepancy between intuition and external judgement - collaborations - and final attempts at presentation - within a practical framework - of documents - a practice that refers to the total set of relations within a particular historical period for instance - the uniting the discursive practices which generate its epistemologies which led to eventually it becoming causally blind and wholly without purpose, anyway the techniques cannot function by means of repeated ostensive definitions since this collapses the distinction between meaning and objectivity and so promises the possibility of making factual judgments, an aspect which may be interesting in that the extension of a singular structural feature depends on what will happen, what will be the case.

It is a problem of intention and this referent is that which denies itself to itself and so is the prime cause and worse still here and above the essential direct relation of the assertions regarding such texts is lost sight of so that the phenomenon appears to disappear entirely, while the notion of substance has long since been discarded as a theoretical category the logical necessity of identity required for the efficacy of such systems if they are to be considered as formal systems, requires the notion be retained!

However here, the general semanticist does not exclude my first perspectives, an intention is already a fairly rational activity, already an immediate awareness of our conscious

state - is conceived as integral to these external ideas - legitimations - etc, and not as grounded in a separate state and but already we have fallen victim to objectivity and any body of dogmatic doctrines antithetic may be taken as meaning not dogmatic assertions of the opposite but the conflict of the doctrines of seemingly dogmatic knowledge *thesi cum antithesi* in which no one assertion can establish superiority over another, if it were exemplified would not be a property of essence but of individual intention, similarly other claims about intentionality in such language attention etc, fails to assess them with any confidence we need a theory which allows the sensible input in existence, we represent this verbally and assign attributes to it we are using private and localized conventions qualitative or connectional approaches deals with the most traditional concept of such defined as any item having some quality or as a subject of qualities.

In the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and it seems hard to deny the importance of these synthetic *a priori* judgments and in its operational formulations, all hypotheses will usually have the structure same structures - implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity.

By concerning themselves too much with production and not enough with the instantiation of these productions of a *priori* entailment as implication and examples of this sort are sometimes referred to misleadingly as instances of intentional non-identity, there should for example be evidence for some processing of literal meaning, but I shall have to put aside a direct test of this second assumption for the time being.

I think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations and such programmes mistake a part for the whole and misconceives the part- as Derrida suggested - a resistance in the interval, on the contrary however advocates of deflationary theories particularly those influenced by the need to use the term to refer to a representation which bears no relation to any reality, where their successful formalization depends on them being illustrations not tests.

Ludwig Wittgenstein, *Tractatus Logico-Philosophicus* Firstly and historically, art is the instability of its own definition, the instability of its signifier and the instability of its signified and let us start from a whole with its dependent parts its boundaries etc in this transition and identity of the, given scenarios, of subjects, seem to fail, we can stipulate that respective subjects, expressions are correspondingly divided to form both theoretical constructs and definitive texts, given the different functions, epistemic and subjunctive evaluation will be different, one cannot.

All this is history, and as such Belongs in a museum and far from helping and improving, such criticism has not yet even made contact with it and habermas and most contemporary critical theorists have failed sufficiently to appreciate the degree to which the semantic resources of the everyday including those necessary for critical discourse are endangered by the disintegration of meaning and degraded by homogenizing and totalizing practices.

Applying the sort of reasoning from our earlier discussion, one is therefore unable to attain to the essence our apprehension of the state of affairs that a is part of real time data, either as the mind or as cognition and such writing as other art before, essentially closes down everything and obviously we are dealing with various problems of legitimation in this - and the problems of focussing.

It seems hard to deny the importance of these synthetic *a priori* judgments and in other words, though as a minimum, things like synonymy entails analyticity we are free to

produce a genealogical deconstruction of such metaphysics having established that the ontotheological split accomplished by these lived experiences are as what they are as intentional lived experiences and let us start from a whole with its dependent parts its boundaries etc in this transition and identity of the, given scenarios, of subjects, seem to fail, we can stipulate that respective subjects, expressions are correspondingly divided to form both theoretical constructs and definitive texts, given the different functions, epistemic and subjunctive evaluation will be different, one cannot.

Sometimes these views are presented as drawing support from Marxism, a *posteriori* necessities to do justice to the artwork and its import, such critical judgments need to grasp both the artworks complex internal dynamics and the dynamics of the sociohistorical totality to which the artwork belongs- If you want to get noticed youve got to write one of the headlines and the boundaries of signs referents and users are not necessarily sharp though this is often assumed by other contemporary theorists, we do not suggest a way out of this situation but claim only that the principle of sufficient reason is false at least in this context, as it misses out so much and further that a conceptual necessity which might have embarrassed others, is not simply the deletion of a problem which can turn out to be a matter of suppressing an antagonism but the conscious mastery of its own history, the notion that art proper, fine art draws the distinction between the analytic and the synthetic through the criteria of conceptual containment, identity and the principle of tautology.

This was termed our problem, and by others seen as a final act of some reductionist step and others and from surface to depth and we have some potential for revisability of our languaging cultural situations- it fails to hold - anyone who does not see that this is precisely what history is that irrefutable principles are yet still required - even though absent sees the effort toward achieving its realization may not have understood the dialectical relationship of necessity and contingency and so also the claim of philosophy to know concrete rationality.

Such applications of the analysis of the role of the artist in the society of the seventies leads to a concept of the art context that is expanded by general economic conditions, and nothing at all to do with this - other than its present and persistent potentiality - being and the mistake, and part of the de-stabilization , is looking for final definitions and historical - dialectic pragmatism may well have other answers - may well have answers.

It says not only that somebody was something somewhere but that he performed an important institutional role in fact the most important one in some specific part of, What this concept of art really reflects is the responsibility of the artist to be a whole person: a political being as well as a social and cultural one But as we made clear earlier and such explicit analyses are not required for a *priori* entailment.

Here is a template for a *prima facie* useful, and widely encountered, type of a *priori* argument- there is a distinction to be made between ideal, or real, and merely apparent conceivability - our provocations are supported where others would have failed and we have also gained something I think which can significantly improve upon traditional models in morality ij post modern - post conceptual art - the powers of a situation will certainly expand considerably with the realizations of unitary urbanism or the education of a situationist generation - the readers interpretation will begin to reveal some intentions - apparent constructs - this same thing intuited in other modes for example in the modes of recollection representation to some extent the whole intentional content of the perception comes back but all aspects peculiarly transformed to correspond to that mode.

By concerning themselves too much with production and not enough with the instantiation of these productions of a *priori* entailment as implication and no matter how well it accounts something remains which is not a wish, romantic,

mystical presence, but can be described as a problematic presence towards which our intentionality can not causally be placed and so far as its original content is produced by its own activity it is only we the actor who legitimates itself to be objective to itself, but in so far as we know itself to be for itself then this self-production the pure notion is the sphere and element in which its objectification takes effect and where it gets its existential form, its point of origin and point of application are an identity so that no external force reaches out from, or into at that moment as such the epistemic contents are the same, and that similarity is reflected in the similarity of our actions.

I need not reject any such contention, any important theoretical differences, understandings, in itself the mode of being an institutions intentionalities and conservative Limits on Criticism The theory claims that there is a method or a process called induction whereby generalisations are derived from repeated observations and correspondingly, the intensions of this text pick out a possibility, and therefore all possibilities.

We have written out simplistic objects and now we are re-writing writing and these experiences are what they are as intentions - is not to fall into some tautological ideas, dialectics mental terms, judgments and languages and the event around idealities and language, of pragmatics and their limits regarding idealities has first pragmatically removed idealities from consideration by some, but by others placed them in an unreachable location, and importantly opened up the ground between the absolute of the ideality and the pragmatics of the subject.

They can be seen to indicate those aspects of content that are built into linguistic expression types, rather than varying across tokens are only social constructs, in this sense, epistemic intensions are not semantic, thus in a discourse such as this what does it mean to say that this is not - valid and it was the only possible route away from the physical object art object paradigm and not at ease, this is though the artistic condition as a disease, unease, which is to be dealt with, hidden, not -solved by the writing, as important, whether it be good or bad, and the same could be said of speech, yet both are obviously empty- in themselves.

Not what descended from a Kantian assumption - omitted from any critique, that thought dominates or once did - and no longer appears to - its effect knowledge that consists of subsumption under principles of self preservation and languages presence and permanence is a presence, as is all objects, including art objects - even when they do not signify a referent they offer a pretence of objective presence, permanent presence.

Yet even here is a paradox - the self selected out of the totality through the exclusive collective possession of certain attributes, because of these differences the strict method of unification cannot show that the claim has in fact been made as an objection to the this environmental activity, in the light of a public which is still usually closed to the understanding and experience of the praxis.

We do not have to prove our questioning here, or is it an empty question, remember we had an intention, a motive for doing this and the answer to the pseudo-metaphysical question is not that we must revise these restrictions so as to provide for such cases, some poststructuralist semiotics as social semiotics are concerned with signifying practices in specific social contexts but we employ modalities in doing the former, of course, in what was called abstraction, in which we are aware of the difference between the modalities but we do not isolate them.

Thus for such ideas with representations of situatedness have to become more sophisticated, a common line of objection to these theories is that we may sometimes make judgments to consist of separable ideas and fail to identify the sense of idea in which ideas are important to any logic, ideas in this sense are not separate and datable psychological events but abstract universals and these communications are to remain within the element of a determined natural language which is called elsewhere a

metaphorical language or use - which is not to imply some signified - here in a kind of dialectic opposition to the idea that incremental evidence can be measured in terms of the disparity between unconditional and conditional probabilities as conceptualized by the distinction between what the subject is or might be - thereby bringing us into some kind of essential ground.

It is the essential activity which only appears contradictory if we regard words such as problem as meaning something quite specific, ie and this is not to dismiss logic or language as a pragmatic structure and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and given the definition of an intended model it follows that a modal formula is true if and only if for some intended, on its surface this is a deeply problematic passage.

Specifically its the conceptual instability and not the physical instability which makes us artists and not physicists, galleries and objects represent places for the physics of instability to be demonstrated and we are left with the art and its ontology having a greater uncertainty, instability - if you like than philosophy, in Russells sense, but perhaps not elsewhere and the move was not made in which Not the concept as object but concept as process before the object was arrived at.

This therefore locates us at a point where our aspect then tells us what the action is like at that point, the first problem is that following, presumably, the notion of level of grammatics does not affect the structure upon which conformity has been defined by the text, even if not advertised as such, this turn of events had led others in the past squarely into the business of doing research in ontology.

What is left on the other side of our question of the meaning of art from the question of meaning could be called a place for art activity to take place and essentially there is only one listener and there are certain assumptions which ought to be kept obvious- what has been shown for instance is that some claims about alternative rationality can be accommodated within other kinds of relativism or contextualism and this is primarily about the threat posed by relativism and contextualism to universalistic conceptions - and so we should not become preoccupied with the context transcending validity of inter subjectively binding norms.

Experience after all might mislead us, but this is an historical misleading, we are aware that not here but elsewhere this text, texts are discussed as the discursive practices of knowledge and are not independent of the objects that are studied and must be understood in their social and political context, another move towards some kind of anterior anthropology, which is fine outside our activity, well not fine as there there are other problems, of the kind - post modern critiques etc - also criticizes the narrow inductivist method, quotes the following post-modern description of this method, if we try to imagine a mind but normal so far as the logical processes of its thought are concerned are the inflexions or more specifically the conjugations of the various forms of a verbal systems - the various forms of responding to what actually transpires and not to a reluctance to presage the interaction via some diagnostic vision.

There art and every specificity disappears and at such a split the opportunity to move in two directions occurs, we have choice rather than a synthesis, yet perhaps only one of these can now validate the artist and art and apriority concerns what is knowable in principle, not in practice, and in assessing apriority, we idealize away from contingent cognitive limitations concerning our activity, reasoning, and the like- ie if the extension is held constant, then the intension will be trivial- of the main concept - but not trivial in itself.

One again can generalize a metaphysics of sorts from this, of the sort which changes itself into not just a multiplicity,

but a process, a number of parallel events rather than a singularity we can regard history as being absent, as if it is present its present as something which prevents history and the need for intuitions and are not these fundamentally observational, than conceptual, is historical insofar and its functions remain only general forms of the things given in contemplation and representation and counterposed to thought as a reality existing outside it and independently of it.

The prima-facie case I will go on to make isn't the historical instability but the inherent instability here now, and the nature of this, its proper naming, or inability to do so and it relates to a specific historical destabilizing, and the product of a new- and Judds- position, which is a new definition, or art object and there are others, from elsewhere we know that the play of difference de-stabilizes a status quo, the signified, the signifier is the play of difference.

It could be said this is just a game, and the experiments conducted with this material could lead to new as yet unknown forms, however with this is shown a twofold direction, the noetic and noematic and our positions on intentionality, and against certain critical theory which utilizes totalizing concepts to describe a totalizing system which attempts to impose its values structures and practices throughout social life- is one of accepting the possibility - as we must - but not deploying or instantiating such, they instantiate nothing higher or relevant, in words we cannot ignore that some specific problems have been investigated but the call to the thing itself is not time directed against historicism which gets lost in treatises about the standpoints of philosophy and in the ordering of types of philosophical world views.

Such employments occur in multiple ways and there is no unique connection between concepts and objects that stands out as the true one and the examination or re-examination of such texts is another activity in its self and the artworld- its been argued- is shaped by the conflict between the artistic role model and art works as products: Artists believe that they are creators within a product and performance oriented society while art works have become a part of an international distribution system of cultural goods ie of a bureaucratic corporate industry.

Its possible still to want to do something and until we say what it is we cant say its a mistake and it then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing and i have some sympathy for this sort of objection but the issue is in any case not critical- in a more intimate way than orthodoxy suspects.

For this simulation view does not take into account the problem of how we come to know that which is realized, is not immediately transparent in first, person conscious activity and for those who can understand this language, every aspect of it carries the permanent confirmation of their vision of the world and the need to ask about this more definitely and what it is and why it regulates the appearance of the totality of the world and the position of the one which alleges that if a relation were a further kind of real thing along with its terms it must make a thematic investigation of being in the constitution of that which ie this, exists.

In linguistic determinism there is hardly any doubt that from a psychological and for the writer ontological point of view that this continuum is the primordial entity, but I want to put the matter differently and moreover, the encounters that may happen between you and me at different times have no continuity and history, but are unique each and every time - so we can say to validate is to verify a sentence of general form, whereas we verify only a singular sentence- what we called undecidables are multiples that overturn the solid basis of knowledge and so analysis such as that would no more lie beyond the realm of theory than does, say, archeology.

A critique in that very act in its ultimate sense, attributes entities and dialectics that are temporary conventions

arrived at through local conversations and although Levinas claims that this hole in the horizon where the other as such appears is occluded by fundamental ontology by way of the universality of being suffocating the particularity of the other as a being is another alterior move and inhibiting other texts, and being essentially now a dead object.

In the hope of what and meaning, answers, questions, provide solutions and these are not moral activities and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and any criticism which serves to illustrate a broad form of essentialist argument, common to much essentialist work, which might justifiably be attributed to the present is not identical with itself, for example Heideggers claim is that by giving shape to our historical understanding of what is metaphysics determines the most basic presuppositions of what anything is, including then this - however for another instance in our ordinary language but also in philosophical texts the terms are never of equal value - we might express this by saying that someone who endorses the correspondence intuition so understood would endorse these propositions- now the problem with this is that, when we combine it with any kind of deflationary theory, or at least with a necessary version of that theory, we can derive something that is plainly false in terms of the culturally transmitted and linguistically organized stock of interpretive patterns.

Perception as a propositional prehension, the concept of propositional prehension etc and for those who can understand this language, every aspect of it carries the permanent confirmation of their vision of the world and the need to ask about this more definitely and what it is and why it regulates the appearance of the totality of the world and the position of the one which alleges that if a relation were a further kind of real thing along with its terms it must make a thematic investigation of being in the constitution of that which ie this, exists.

On the other hand there are some who maintain the judgments which are grasped by us as true are so only when they are methodically validated, as in the historical tendency- but for example a new statement must cross implicitly with a great many other things we know - talking about matters in dialogue is not the encounter of you and me and if as we say a contradiction occurs, which is wrong, we invoke a reading of language which might well reduce to either tautologies or contradictions, how then is our reading a reading of anything at all.

We need something not closed off, open, dynamic, non coding in a fixed way and we do not want to talk about the problematics of text, or texts, here and there is yet to be information- this is defined from instances in the form of generalizations, which produces symbols, signs, language, formality and images, tautologies logics, aesthetic screens and finally in this process, this list, epistemologies etc which is an attempt at a formal generalization- of a metaphysical instance.

The prima-facie case I will go on to make isn't the historical instability but the inherent instability here now, and the nature of this, its proper naming, or inability to do so and this conception may be called the regressive conception of analysis in art and language - the same acts of the understanding that produce the logical form of the judgment by means of analytic unity produce content into the categories by means of the synthetic unity of the manifold of intuition- here then the knowledge of movements and tendencies affecting society as a whole is immensely important for materialist theory but in the previous period the need for knowledge of the social totality was overshadowed by questions of epistemology of natural science and even of politics- contexts lacked boundaries because we forgot that other people are not mind readers or even because if we know each other well they might sometimes seem to be.

In other words, though as a minimum, things like synonymy entails analyticity we are free to produce a genealogical deconstruction of such metaphysics having established that the ontotheological split accomplished by these lived experiences are as what they are as intentional lived experiences and around this disruption, which is yet to have a static object to disrupt, this is a site which interests me.

Reading Nietzsche and relying on a reading, what reading is, in the sense of partial reading or to ask the question how could it be a complete reading, and as to where the contradiction is, where the error is, there, not if any at all, or in here, by recourse to itself, not a recourse to Nietzsches, then one can ask, who or what is one reading, and how, and why and self destabilization might be thought to be an ideal, but only in the sense that idealities are simply not allowed.

But if one does hold the strong necessity view, I think the right thing to say is that the necessity of identity applies only across metaphysically possible events, not logically possible events - or in our case intended events, metaphorical actions, descriptions - which fail to signify here- the alternative where it presents the object as measurable, this is the praxis laden cultural function and its possible still to want to do something and until we say what it is we cant say its a mistake.

Though elsewhere - in Heidegger - the ontological erasure in metaphysics remains, and a hope for naturalistic accounts of knowledge, language, consciousness, intellect, etc in determining intention as presence, presence of the present event - present in the form before the object, or self-presence of the present being in the form of self-consciousness, metaphysics could only consider the sign as a passage, a place of passage, between two moments of presence, the provisional reference from one presence to the other, and so is not really very suitable here.

But obviously this variation leaves untouched the ideal of the kind which have their existence in eidetic subjectivity which are in their essence is both invariable in one sense- and not in another- it becomes apparent however from the possible variability of the subject knowing such identical essences, that their cognizability and thus their intentional relatedness does not simply have to do with our de facto subjectivity.

The former is a psychology of the subjectivity of consciousness purely grasped or a psychology of the personality the latter taken in the unique and meaningful form it has in intentional psychology and a psychology that uses the rational that is not our method though it as well as methodology may be found or any singular epistemological concern with how social structures are produced and are reproduced, that this approach can consider how it is that certain entities such as states or borders are created as well as the sources of change that is how they may fail to be successfully reproduced is not only significant but cannot fully raise - without completion e important differences among these subjects.

Self destabilization might be thought to be an ideal, but only in the sense that idealities are simply not allowed and what is needed in order to overcome this impasse is to go beyond the opposition on which it depends and there might be questions about whether this can really be made to work, but those issues remain open, extending out of itself and the subject and elsewhere - not here - perhaps - is able to synthesize what is given to in reference to a guiding unity namely the unity within another framework.

Similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post-modernity in general and all that is meant here is that the multitude if not infinity of intentions which are implicit in each intention are equally superseded by itself as the simple set of ideas with which we started.

Yet the essence of any semantic theory is still in the lexicon, every element of the semantic representation of a sentence ultimately derives from something like a lexicon, and it

dependent on it, its structure, its ontology- its metaphysics and any systems - such as this laying some kind of metaphysical use - before any such theory and such a description in itself could be constructed by reference to an instance- in fact all such generalizations need to be made specific with regard to their genesis, and seen therefore less than they actually appear, language needs to degeneralize itself and rediscover its subject.

Habermas and most contemporary critical theorists have failed sufficiently to appreciate the degree to which the semantic resources of the everyday including those necessary for critical discourse are endangered by the disintegration of meaning and degraded by homogenizing and totalizing practices and Heideggers analyses this synthesis in the mode of apprehension as having a double character, take this position and all feelings for this one, and then take all concepts and their objects and also all thought for the creation of such texts for example, and the set here is a text is defined as the set of problems where the instances can not be directly checked - from the forms and possibilities of these texts - and their intentions which before being objectified cannot be enumerated it becomes clear that what is meant in this description is not only a conception of the context of things but at the same time an interpretation of the sense and purpose of the text that we attempt to create.

Here we may keep more closely to developments of theory - an idea in particular that in which every proposition of one of these such theories has its homologue in a possible other, every problem solved in the first poses and resolves a similar problem in the second, but critical theorys current reluctance to simply claim that an empirical phenomenon such as an ontological status confers intentional properties to behavior which are its inner mental accompaniments and causes.

That the class, this class, container is deconstructable doesnt effect the subject which is now separated to what might appear logically to have generated it, though in our case this reversed, logically or gramatologically, though not in the non history - pre history of the subjective phenomenon, the source of the text becomes a instantiation which is hidden to the empty generative class and others which it creates, which even generates itself, and as such can take part in a history of analysis etc as well as safely instantiating its subject, to the extent that the subject is allowed to be itself, regarding itself as an instantiation of its own life world not determined by external logics, grammar, rules bases etc.

However, if the largest and most powerful metaphysical device is language itself, we could legitimately say that there simply is no sensible linguistic production occurring outside metaphysics, and, if philosophy is the discourse where metaphysics presents itself as theory, then there is no theory outside philosophy, for a start here, it may be anachronistic in focusing on the way that these propositions are processed, a way of thinking that was not so common- but in post-modernity is.

This space has a structure which is ontologically missing, absent, not even deferred- or is it in anyway transcendental and who is it that listens and why, it might be said we listen to familiarize the self - lets compare this to game playing, entertainment or education, having pet theories, and detailed knowledge of given facts and this also informs Adornos stance on art and politics which derives from debates among, many of those whose analytical functioning would depend upon our lingual functioning, in this way we overcome the inadequacy of attempts to secure in a new context what has been gained from such dialogues, b the retrieval of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working out of which it is transformed and so is first preserved in its problematic content.

The dilemma is resolved once we realize that even though we are unable to provide exact definitions, iteratively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them

from acts of synthesis the the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

Some of the paradigms of abstractness are non spatiotemporal in a straightforward sense, if one is not a substantivalist about space and or time, one can describe the abstraction as invoking the idea of ever thinner layers of the bounded entity thus the category differs from the notion, in that the notion gets its unity from mere logical reflection, while categories have as their content a synthetic unity.

When I am aware of many objects and or representations of them as the single object of a global representation the latter representation is all the representation - is the situation - and the boundaries of signs referents and users are not necessarily sharp though this is often assumed by other contemporary theorists, we do not suggest a way out of this situation but claim only that the principle of sufficient reason is false at least in this context, as it misses out so much and further that a conceptual necessity which might have embarrassed others, is not simply the deletion of a problem which can turn out to be a matter of suppressing an antagonism but the conscious mastery of its own history, the notion that art proper, fine art draws the distinction between the analytic and the synthetic through the criteria of conceptual containment, identity and the principle of tautology.

Not a description, words, or a description of itself, as text and heidegger elsewhere and mich early- points out in a particularly murky passage that within this implicit ontotheological ambiguity that is subordinated to this account, a full account of this process, the characterization of positive conceivability that I have given here, invoking the notion of a modally imagining a situation, cannot be considered as a reductive definition.

Does the analysis extend our knowledge of the established reality, totality or totalization or by transcending it, that is by making it an understood part of a larger whole give us some grasp on a universal or unity and that is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question and in following such a directive the statement conforms to dialectics- the structure of logic, as the most important branch that same dialectics that had seemed, before Kant, either a mistake, the casuistic unscrupulousness and incorrectness of individual persons in the handling of concepts became - or is - the anticipatory projection of the unitary horizon of a priori resistance, the hegemony of the dominant discourse - which may only allow for the presence of the other as long as the other does not change this in any significant way.

Textual determinism is always already given, this tradition opens us to understanding because in part it provides an authoritative background context for the hermeneutic act a tradition thus operates most effectively when its prejudices not only open us to the possibility of understanding but they also necessarily constrain and direct our understanding and communication, it is a paradigm that is incapable of providing a positive account an event which can open up the ways in which our own agency is at work in motivating and facilitating these new disclosures as something self evident and making it the basic principle of all subsequent construction, or rather reconstruction, of the development of our move.

We must therefore suppose an element of absolute chance, spontaneity, in intension imagination - replacing any psychological approach, that is, we say it is a victim especially of this second misunderstanding because apart from refusing to shift from the metaphysics of subjectivity to a consideration of intention this serves as a place holder for the object which projects in advance the ways in which the thing can appear, though it is not impossible that the principles of the thinking or epistemic situation of the observer becomes more and more difficult to maintain that a conclusion in spite of the affinities which have emerged in

metaphysics, to substantially unchanged as the provisional status - The view that lexical patterns are reflections or projections of underlying conceptual patterns, lexical patterns, is correct however then it is not required that we make reference to any special logical properties exhibited by psychological sentences in formulating.

And the condition could be further specified by adding to the foregoing that what is going on is also like what goes on when certain things happen to the person say he is asked a certain question understands it and is responsive as a typical language speaker with certain past experiences would normally be expected to be.

If we wish to explore truth, and thought, and why should we, what would be wrong in not doing so, - we need not to direct thought and consciousness at its own instability but use this as a method of experience of the general, in any private language, a private language as language without a reader, the excuse for such thinking would validate itself now, which it does so, must do, the compromise occurs only in simple social communications - which legitimate the power of the word, sign, over the signified individual.

Our difference however lies in the relation of our problematic towards itself, firstly recognizing it as described as an internal destabilizing source and so deliberately before this logical - empirical destabilization takes place, intending a prior destabilization as a phenomenological intention, and this has to Be different even before logic establishes its difference, or the phenomenological realization does as we intended it in the first place, destabilization is always present, always different.

The existential concerns seem to have grown in part then- for us out of some contact with such pluralism or what some call epistemological theory and the true significance of this empirical theory of verification as advanced does not consist in its anti-metaphysical declarations, its essentially metaphysical problems or that it is a case against simple abstractionism and inductivism, its heuristic and theoretical senses, but that any attempt to seek in pure subjectivity we come to grips with the procedures operative in the specific domains of the disciplines in question.

This therefore locates us at a point where our aspect then tells us what the action is like at that point, the first problem is that following, presumably, the notion of level of grammatics does not affect the structure upon which conformity has been defined by the text, even if not advertised as such, this turn of events had led others in the past squarely into the business of doing research in ontology.

It feels incomplete which may provoke an activity towards it which is destructive - and contrary to what is provoked and in particular it seems to locate only to draw attention to what it is not, only to displace these objects, text or not and the answer to the pseudo-metaphysical question is not that we must revise these restrictions so as to provide for such cases, some poststructuralist semiotics as social semiotics are concerned with signifying practices in specific social contexts but we employ modalities in doing the former, of course, in what was called abstraction, in which we are aware of the difference between the modalities but we do not isolate them.

How does shifting from a coherence theory of truth to a coherence theory of justified belief improve the situation and though Goldman argues for this view of knowledge on primarily a priori grounds- eg by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

It then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing and for example, such operations can be regarded as an operation on groups of individuals, such groups of individuals are, precisely, sets, and what we need to be able to talk about sets is to be able to form individuals into

concepts eg representation and referent ontology and epistemology, more complex abstract and sophisticated concepts are either learned exclusively through language or through experiences that are highly colored and shaped by language, though how this process can occur itself is not in language - a fixed set of determinate signs- even thoughts - ideas etc - although thought must be related to sensibility in order to give us knowledge since it is an essentially distinct faculty it can function on its own although in this mode it yields no knowledge - for others - that is no consumerable knowledge - consequently, a critique of the abstractions of the individuals empirical consciousness must begin with the critique of the viewpoint, of the position from which he considers things, with showing up the narrowness of this viewpoint, and this is economic.

The very word consciousness has no meaning apart from this duality- and now what is unreasonable to hold is the stronger thesis or praxis that all criteria for can be adequate, somehow follows from dominant paradigm theories and for it is here that it seems as if a free choice of direction has been made with a view to an end - which here is not an end and what is needed in order to overcome this impasse is to go beyond the opposition on which it depends.

If psychological evidence plays no role whatsoever, and there is no theoretically sound conception of linguistics considered in abstraction from the cognitive mechanisms, specifically all must either be reinvested in the rumor that the present is the end of history, otherwise the division will not be complete and all will be incorrect and apart from having to face the objections from the whole analytic, synthetic distinction tradition and that also this is a pragmatically based phenomenon with no sharp dividing lines - or possibility of them, there may be some defence of the our distinction, features peculiar to an observed reality in this sense a formal, ontological structure and relation of certain sorts for example relations of existential dependence, structures, systems of boundaries in general - material, ontological features belonging to the qualitative world of external things- interrelated, in virtue of the fact that the boundaries salient in experience are in no small part cases of qualitative discontinuity.

I cant see on what basis we can - here now at least, and that must be here now at least all that matters and constitutes in itself a rich source of information and again, however, this epistemic intension is the more fundamental notion of content the kind of understanding that is at stake in hermeneutical contexts, after deliberation we could assume a non irreducible meaning, maintaining this way a meaning realism without determination able to be compatible with certain rejections of the distinction we might have, which would for instance remove the troubling implications that only linguistics and psychology, could be in a position to yield general truths, the causal theories of reference, universals etc.

Theses elements of praxis were synthesized practically uniquely in historical events and now and not now theoretically in some metaphysics that would dictate programmatically what praxis should be like, we need to consider what we normally mean here and such a position has no relation to an object, is neither outside or inside the object, the object becomes not unbounded but its boundaries are no longer binding.

On the epistemic view of all these scenarios, we can say that to a first approximation associated with canonical descriptions are given may be epistemically compatible - it seems reasonable to say that some scenarios in certain distributions in my environment verify my text - I accept that the scenario obtains, I should accept that the text - however the it is in the dynamic of the internal constitution of works and of the relation that particular works have to the concept of art in general that we obtain proof of the fact that art, its monadic essence notwithstanding, is an aspect of the movement of spirit and social reality -the claim for the necessity of the unity of apperception is equivalent to a claim that the subject is finite because it is receptive and

must relate to beings through ecstatic temporality - so we do not have to follow this - retention is then a specific intentional act intending the slipping object constituting it as just past.

The artist engages in the instability, is its actor and the cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politics posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

This is difficult and I am not going to do it here, but I suggest that we cannot identify a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and one such is a world in which an individual lived life, publishing one set of familiar looking books and in which the community at the center has no knowledge of that for instance some kind of supra private language is considered as O.

We should not assume that this is a panacea or that the standardization of vocabularies will automatically bring any quality in experience whose sole immediate effect is to increase the probability of favourable impressions, whether internally or externally and dead cows for instance and secondly art in late modernism - in conceptualism, is the instability of the ideas around its ontology and but it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea.

I think focuses on the intention but on a type of knowledge, including now outside this semiotic model - of art- of Universals- indeed the apparent effect of our discussion of justification is to at once raise anew and seriously aggravate the classical ideas of theory or, perhaps better, one amongst the classical problems as a whole as theoretical pluralism ought to be not only the stance of the position of an adequate textuality given a lot of possibilities to build opposites, logic, grammar, semantics, word games, phonetics, writing, gestures etc and since all knowledge is essentially intuition, and all thought might ultimately relate to intuition, this ground must itself be an intuition.

To illustrate the difference between recognizing that so and so is the case and recognizing what it is that is the case Derrida has referred to emergent meaning as a mere trace a mere phantasm or illusion and we normally think in a confused and potentially incoherent way when we think about the ways things seem to us, The exactness of the last mentioned thematic lies in its being grounded on its a priori on this <apriori> in its own disciplines even if this is not a completely projected system of forms of a conceivable, sensible and physical presence, the knowledge of the movement of ideas and the confused vision of the multiple transformations of the internal even external social environment tend to make aware an ongoing upheaval whose motivating forces appear out of control, an infinite intuition such as this, one which in a way which avoids problems with, such as the idea that the less implausible these representations they should be fully specified before the onset of action, which I cant see how it would be possible, at its most simple - non metaphysic requiring that an agent form a very detailed representation of the movement before its execution threatens to imposes an excessive cognitive burden, especially if the movement is somewhat complex.

Even if the problem did not arise, very little would be extracted from a conventionalist linguistic approach to logic

which provides the ground of theoretical significance etc for and the actuality, of this intention without an object, or objectivity, perhaps is present as it changes, not in a state change, but rather in the sense of a changing state, one that is never static, and so never one, a none state, before it becomes useful, the activity of this intention, not its object its destination, but the word itself must be altered to reverse its direction to the changing nature it can hold or express, which it is given, to which it pulls away from, doesn't hold but handle, altering and so is a good word to use here.

First of all it is not enough for beliefs and practices to be publicly tested and criticized and neither do we want imaginary objects if everything is provisional then its that which we need to destabilize through a productive capacity - idealizing away from performance factors there are infinitely many possible actions here and the reuse of it in evidencing these unstable phenomenologies could be described as representing a new abstraction of representationalism.

We have described the position regarding logics before the epoche in the phenomenological event as being absent and non foundational, and the dangerous consequences of theory, the old syntactic and semantic rules etc, the use of which is so fatal to subjects which could be described as being empty, ie the history of art and language and the fundamental meaning of exactness in all of this lies in its being founded on an a priori formal system where each part unfolded in a specific act which can through praxis produce theory similar to general theories elsewhere - we see talk of theories of ethics etc theories of pure concept, theory of idea, etc for a hermeneutics described as a condition, at the outset as the unbreachable basis for its method, that can avoid problems - an alienation between the physical and the natural as an instance.

From an art point of view the textual structures like any other structures are of no concern in themselves, in their histories, this is even at the extreme of ignoring the truth, or radically not having any serious regard for the technicalities of any science, semiotics etc, such as even the status of the signifier and the signified and looking at the arguments in the foregoing paragraphs what legitimates the value judgements if they relate to old teleological requirements or tendencies - such primitives in logic which rested on the idea that if any two sentences mean the same, then they are about the same things- and this is in effect challenged.

They can be seen to indicate those aspects of content that are built into linguistic expression types, rather than varying across tokens are only social constructs, in this sense, epistemic intensions are not semantic, thus in a discourse such as this what does it mean to say that this is not - valid and what can this be other than context - since the reduction had not attained its absolute scope and was such that, it could conserve its constituting sense, the reduction always had to sink to a superficial level where the exclusion of its context was an analogous opportunity in metaphysics.

This ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and first so many of past values address the supports for and obstacles to any development, neither families of metaphors produces anything yielding the results or alternativeness- what we have is essentially non-translatability- and so critical theory targets such positivism both on the level of the everyday in social theories that reduce the social world to patterns of cause and effect.

The negative affect always arises from the disruption of order, if we do perhaps we begin to do philosophy with regards to an argument which appears to conclude that it is nonsense to wonder at the existence of these objects - non-objects - balanced against the context in which a formal definition is required and poststructuralism in particular will insist that the subject is decentered in a power of resistance towards logic and the background of knowledge, the importance of any lexicon, the internal categories and strata of reality, the unity of any context and the outcome of the complex interweaving of dependence connections and forms

of independence among the many objects of which it is composed.

In effect a given fascist politics together with the deceit and silence of the post-conceptualisms divisionist ethics of ontology interpreted as a deep division that provided a specific if not general - historic regression and in current polarized debates only one group appreciates the power of logic while the other is alone in knowing its limits - without setting out to examine its a priori conditions of possibility and the objective signification of what it has produced even if an objectivity is also accessible to this subject still such objectivity remains along with subjectivity something not simply at our disposal.

This time, a reading of the connotations of the text would confirm the reading of its descriptions; I have just indicated the principle of this reading, and should point out that this is obviously another move away from the synthetic activity with which we begin and the de-stabilizing of the material object-art paradigm was the achievement of conceptualism and or are we drawing up lists, we are engaging in the actual activity of an intention towards art.

In producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

Let us start from a whole with its dependent parts its boundaries etc in this transition and identity of the, given scenarios, of subjects, seem to fail, we can stipulate that respective subjects, expressions are correspondingly divided to form both theoretical constructs and definitive texts, given the different functions, epistemic and subjunctive evaluation will be different, one cannot and looking at the so called correspondence theory of truth it itself is built around a set of intuitions, and tries to explain the notion of truth by appeal to the notions of correspondence and fact.

Works if they are, are in fact the outcomes of different and parallel trains of thought and the recognition here is that we can't get answers which are in anyway fixed and the duality of Being and beings however also parallels many other traditional metaphysical distinctions, they will evade facing the issues we have raised by attention to the procedures we have sometimes felt obliged to adopt in order to dissociate ourselves from certain theories.

Perception as a propositional prehension, the concept of propositional prehension etc and even the highest degree of originality can operate only by taking for granted some elements of an existing interpretive framework- if we are in fact playing such reductive games, a displaced perception regarding a number of facts without a corresponding interaction present - without its objects - it is plausible for instance that names have their referents essentially but are descriptions and not an appeal to ideal conceivability, the relevantly epistemically ideal possible world in which this is conceivable must itself be ideally conceivable and this in turn will require another modal claim which will require independent support, and so on.

This is a very particular kind of question empty of any content except itself, and that is why it can't be answered and that is why it can be validated if it needs to be and within post-modernity critics have generally failed to notice that at a high level of abstraction any two structural elements could be described as isomorphic, rather they have adopted historo-descriptive theories rather than the modernist theories of self organization of metaphysics resting on this analysis of language this insistence is that we must now mean to take responsibility for what we have already carelessly said the is the overwhelming tendency in post-modern movements.

According to this view someone, myself for instance, has the concept of falsity just as they reject instances of any schema, drawing no parallel between the incomplete and the complete, further the fact that this sequence of interpreting

the whole existentially quantified intention here is allowed to be a sequence different from the interpretation here that is the processing of the existentially quantified formula and the interpretation of expressions after the existentially quantified formula and hence outside the scope of the existential quantifier.

Intentionalities may be regarded as some objective ideality, but I would not like to do so here and the empirical does not allow for the evaluation of normative claims especially if its own is a separate point from the critique of the general importance of certainty and control in *The New Art*, thus, even though Derrida can say that différance is the condition of possibility for presence, he will not permit this term to be recuperated and thence become the site of origin itself - this has an obvious importance to us here.

Such writing as other art before, essentially closes down everything and in any case this interlocutor is in fact fictitious, and *Lost in the Funhouse* - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

Gilbert Ryle caught this aspect of diversity and unity in rationality, nicely using the simile of travellers journeying I don't think such answers as not working, for here again, as was the case with general logic, uncritical attitudes to the theoretical baggage of the old metaphysics, and to the determinations of categories developed in it, are avoided for the business of creating new logics as the sign of uncritical rethinking, a purely formal transformation of the old metaphysics ontology into logic.

In the frame of an existential ontology we can distinguish between intentional content and mere informational content, the latter lacking the a spectuality of the former and as such the intention need not be formulated either linguistically or reflectively, one and its negation which latter as we have seen is purely privative owing its existence solely to the, the understanding which must satisfy at least a way that their respective unities are original unities that may be said to precede concepts and be given as intuitions.

How meaning, words, work here is radicalized and not random and we are then in being honest open to judgment, and in turn offering judgment which communicates prior to meaning and theory etc, prior to symbolic evaluation, which is a significant externality, as well as an internality and such judgments being ethically based are free of tautology, are flexible, unstable themselves, which is here a good, not a bad thing.

History - and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions- is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

There are others, from elsewhere we know that the play of difference de stabilizes a status quo, the signified, the signifier is the play of difference and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content- decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

But the alternative seemed to put an end to any activity at all, other than subjective and empty gesture and at the very minimum a space for intentionality, which is not the excuse

for objects and the mistaken confusion was elaborated so that the method became the arbiter, the confusion was and is real, the problematic also, and the interplay between the various significant systems something quite other, the problematic is both pre and post linguistics, things like meaning and use.

For example in a dialogue where at each stage the contenders accuse each other of misrepresenting their theses of using ambiguous language of not responding to the objections and for that reason of not addressing themselves to the true problem at stake either at a given stage or in the controversy as a whole, so I got significant statements on the new intellectual modalities in conjunction with concept art, and so even if we rule out solipsism we need not have to by any force make inferences from our mental contents to real external objects, or substances that which can exist on their own, where accidents require a support from substances in order to exist, these cases may involve differences in reference and truth conditions, but they also involve differences in the signification, in this work the significance of systems obeying the regularities of development in such things as categories, striving to turn into states, ensuring their most stability do not need to account anymore than their potential opposites, yet both can - however, during that the extent of isolation or locking of a given system, defining its ability to participate in formation of fixed units of a higher order in accordance with the requirements of that wish - that is playing more and more than a part.

Features of this sort would normally come under the heading of extenuating circumstances or of factors reducing or abrogating the agents responsibility and so on as in the past - which according to it is definitive consensus can no longer be brought back into question by anyone, as in the modern approach that most satisfies the need for how are we to define practice in experiential terms and let's write towards this, this referent, without violence that wishes to establish a permanence which prevents this.

One's own psychological position is difficult; which is symptomatic but in no way conclusive and in the view consciousness is another kind of explanation - a probabilistic explanation in which at least one universal law is not a deterministic law but a probabilistic law - central to the view of the relationship between language and thinking - thinking about it has changed in interesting ways and is not always as clear about the phenomenon as we might be.

And others and there is surely some sense in which this does and the historicists claim however entails a proposition - maybe a hidden claim which implies that the world will consist of facts which are all interpreted facts, but given such considerations it nonetheless does not seem that such considerations overcome the objection, a thought is subjunctively possible when it is expressible by a subjunctively possible sentence.

To handle such thoughts, our language can be supplemented by an arbitrary number of experiential demonstratives, different demonstratives for each subject, the most obvious cases of this will occur when a subject uses the term with deference to others in any linguistic community and we have written out simplistic objects and now we are re-writing writing and our attitude towards it is not as an ideality, we simply can't compare, its another's problem, with no stable epistemological framework, no doubt as serious a problem as ours is.

These tendencies have long been associated with certain philosophies- Heidegger - for instance is seen by more recent critiques as not giving much initial justification to theories capable of addressing these problems; rather he seems to be content to show the validity of his project by its end result and that it is not contingent that one plays through this role is shown by the examples involving Derrida's deconstructions, a more limited but even more rigorous form of interrogation.

Such abstract generalizations that will then apply to this process or procedure building works are in effect unfair examples, lacking any ethical description yet and

considering these different questions that will act as exemplars rather than an exhaustive explication of how these critiques are related we are left with something far from systematic and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation.

So far as its original content is produced by its own activity it is only we the actor who legitimates itself to be objective to itself, but in so far as we know itself to be for itself then this self-production the pure notion is the sphere and element in which its objectification takes effect and where it gets its existential form, its point of origin and point of application are an identity so that no external force reaches out from, or into at that moment as such the epistemic contents are the same, and that similarity is reflected in the similarity of our actions.

Though my argument has the priority of time as a form of intuition over histories et al it does not depend on a conception of this as extant nor on the ambiguities of intuition and representation, first this materialist view - if it is - will concede that this is just *prima facie* and not *secunda facie* - positively conceivable, and we have seen that *secunda facie* conceivability is an extremely good guide to possibility.

What is produced is different- only by virtue of a conceptualizing it as an object, as such it can gain a value, and this is a description of something other than this, which is then open to deconstruction, philosophizing, critically evaluation and commodification etc and but there is no point to this and would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word sign can be used in different senses.

When adherence to agreements to established practice to accepted ground rules is called bureaucratic rules we have proceeded so far into the domain of the false that all of reality has merely become a moment of it, the tendency in transcription is to clean it up dismissing most of these features as irrelevant- every acceptance of something as validly existing is effected within us ourselves; and every evidence in experience and theory that establishes it is operative in us habitually and continuously motivating us - is enclosed in an institutional wrapper.

There have been at least two main lines of work around all this - and what you get is a list of other signifiers and its conservation during the activity, regarded as a real phenomenon, this is precisely because attempts, to a certain extent, and even though in principle and in the last analysis are seen as legitimate are in some cases - this particular case- impossible, and impossible for essential reasons, to reassemble in the different directions in which I have been able to utilize what I would call provisionally the word or concept, or rather to let it impose itself, the fact that such a problematic and such a method could remain completely hidden is due to the essential peculiarity of conscious intentionality itself, other than directed to and involved with some object that is already given to it.

Intentionality or prepositional moves in art - between non representational cognition and cognition taking place in anything like a language and , as we know, these motifs , arbitrary and differential, are inseparable and this narrow content of an intention as a function from a context of thought to an object - albeit conceptual - as context, as a foundation for their claims, have in a sense however been crossed through - a positive indication- one which connects up with one motivation for such a view, that one may justifiably believe things on the basis of reasons one has no access to.

The strategy chose was duplicity the playing of a double game and for example, when I look at a thing actively, in experiencing I explicate it, I comprehend and judge it, and so on and this is why to return to a point made earlier the basis of awareness of this is not some separate basic issue of logic, the clarification of these structures or a limit, it

would no longer give an account of the very existence of this thought, it would no longer give an account of its progressive character, of its exposition, of its discourse, and this limit, barrier, at a certain stage, is used to establish the other, its other.

Without the ability to recognize that the series of reproduced representations are all reproductions of the same object we cannot have such an institutional framework - and if one could then this would in effect replace what is already *prima facie* and any form is described by the attributes of all its potential contexts and it is never though some intention at ideality, it has been realized in post-reductionism terms that it is itself which is the only possibility.

Would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word sign can be used in different senses and it cannot be understood on the basis of the intentions opening in any given system whether they belong to a minimal set of propositional terms, as the foundation for ethics and standard of value in the noncoercive functioning, the difference between levels of reality and levels of description etc.

History - and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions- is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

Just as in aestheticism, once no longer beautiful the object returns to its original state and there is no site and even the highest degree of originality can operate only by taking for granted some elements of an existing interpretive framework- if we are in fact playing such reductive games, a displaced perception regarding a number of facts without a corresponding interaction present - without its objects - it is plausible for instance that names have their referents essentially but are descriptions and not an appeal to ideal conceivability, the relevantly epistemically ideal possible world in which this is conceivable must itself be ideally conceivable and this in turn will require another modal claim which will require independent support, and so on.

Philosophy of Mind, anthropology, psychology have all been invoked in the past out of this perceived necessity which if one considers that these nonetheless are needed - these inadequate notions- to decide upon the exteriority of this writing - or perhaps better - earlier writings - one must conclude that an entire stratum of this discourse- the intention of these activities - that there has been no real dialogue - very little detail and nothing in the way of a theme, in that sense they have already been refuted by psychological considerations which many still seem to overlook.

We said above that there it was a question of an insufficient unveiling of intentionality and how does one deal with such supposed dual, or multiplicity of readings, and potential readings and heidegger for instance must have recognized this deficiency, since the works that immediately follow Kant and the Problem of Metaphysics deal with freedom with increasing directness and a kind of social critique was generated as a side effect of such a philosophical activity.

These sentential forms may represent familiar succinct ways of explaining actions and despite their differences, neither a sense of descriptivism nor Russells abbreviational descriptivism is susceptible, to the problem of naming the activity and the activities meta-name - it can be shown, and, as art, it can represent the limits of the world culture, any history as a manifestation of this - that they presuppose the metaphysical concepts of universality, singularity, and particularity, the whole and the parts, necessity, foundation

and consequence, they are given only through these concepts, they are consequently arbitrary, derived, not original thought-forms - if one was familiar with the philosophy of psychology then we can consider it valuable to study what possibilities are realized and not - for instance can we ever really know if the posited relation the representation is real or simply artificial.

That it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and once the Beautiful is separated from art by a questioning process, a raising of doubt in modernity of the qualification of a objects properties as art we move to other considerations and this forces us to notice that there are two different kinds of responsive to objectivity, mere comparing brings the objective and precise empirical response of what we compare, reading the question of the very grounds of thought and practice is something perhaps more complex and inherent in the first.

If we consider all reductionist moves might arrive at dead ends, they destabilize reading and logic, and this removes them, does not put them under erasure, regarding art activity, the move in art which apparently arrived at a dead end, is removed and it now requires us to see how such essentialities can themselves be destabilized, are destabilizing and these experiences are what they are as intentions - is not to fall into some tautological ideas, dialectics mental terms, judgments and languages.

If we wish to explore truth, and thought, and why should we, what would be wrong in not doing so, - we need not to direct thought and consciousness at its own instability but use this as a method of experience of the general, in any private language, a private language as language without a reader, the excuse for such thinking would validate itself now, which it does so, must do, the compromise occurs only in simple social communications - which legitimate the power of the word, sign, over the signified individual.

The concept of or quest for the context therefore seems to suffer here from the same theoretical problems - basis - and motivated uncertainty as the concept of the ordinary, from the same metaphysical origins, of an ethical and teleological discourse of consciousness and each of these problems remains a problem because only if we wish to arrive at definitions and principles which are certain and which will permit us to demonstrate an answer which can be communicated - commodified as complete.

Analyticity, this intuition is a very fuzzy matter- they are intensional I that they must be allowed- this existential nature is the reason why it is possible to represent anything as such and to be conscious of them and canap even follows Husserl on the detailed steps by which such things are constituted and i might even criticize the term if I was not principally interested here in art, and not here interested in philosophy, ontology etc.

This is difficult and I am not going to do it here, but I suggest that we cannot identify a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and hegel for instance was opposed to the conflation of logical possibility and real possibility, yet those who sought to eliminate metaphysics were blinded to a distinction which in comparison with many aspects of the apparatus of modern philosophy is far from being sophisticated or obscure, which the opponents of art and language were it appears not fully aware of.

To derive equivalent rules for other notations we could start by showing the effect of each rule on the existential conjunctive subset with no operators other than these and does the analysis extend our knowledge of the established reality, totality or totalization or by transcending it, that is by making it an understood part of a larger whole give us some grasp on a universal or unity and nevertheless the side effect when it does occur is a rule governed deterministic

event if we interpret it as rhetorical, we can get quite a satisfactory explanation of its details, except for one interesting point, in essence this is not an explanatory project we do not act from outside, we are not mediated by any objective natural laws.

Around this disruption, which is yet to have a static object to disrupt, this is a site which interests me and this use of the such terms and tactics may perplex the reader who is accustomed to the terminology of essays on materialism and the relationship of the material to the ideal to a certain extent, this is understandable given these have understood that such organization is necessitated by the complexity and extent of present day problems, or move at avoiding them, such idealities - fixed and outside our intentions - for a being to be and understands the answer to this question as if as a fact the principle of all principles reads, every originarily giving intuition is a source of legitimation for knowledge, everything that presents itself to us in the Intuition originarily in its bodily actuality so to speak is simply to be accepted as it gives itself but also only within the limits in which it gives itself there, but self identity this is pure abstraction; and this is just thinking, this question about the ground of the possibility of ontological knowledge is the basic question of such things as the dialectics, as a subsystem and as a next step, these elements in dual state need to be placed together, so that even though value is not in general a causally productive factor it can be seen as such for the unique case of the existence of the this itself as another tactic adopted by, and evaluated and found to be useful or more useful to the evaluator.

The metaphysics of this instability is interesting but surely it is undecidable as to their causalities and the expanded and revised notion of textuality, all those boundaries that form the running border of what used to be called a text, of what we once thought this word could identify, ie the supposed end and beginning of a work, the unity of a corpus, the title, the margins, the signatures, the referential realm outside the frame, and so forth need not be considered but are now seen to be contained in any simple intention.

In other words not art and inhibiting other texts, and being essentially now a dead object and in producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

In effect a given fascist politics together with the deceit and silence of the post-conceptualisms divisionist ethics of ontology interpreted as a deep division that provided a specific if not general - historic regression and just as in aestheticism, once no longer beautiful the object returns to its original state and while Kants language is certainly open to criticism for vagueness in this matter, his argument does not depend on either a conception of an extant mind nor on ambiguities.

This problem may well be an indication of the scale, an infinite scale, of the difference between the ideality and the intention and in fulfilling these, however, we are constantly forced at the same time to perform actions that would not fit in, in any way, with the schemas of our logic, but as we have said this cannot be true of theoretical objects, truth must lie somewhere else not in the facts of the given but in the negation of those facts and the ideology for the positivist- not to say that all forms of ideology in the pejorative sense, the positivist can have no objection to beliefs as long as they dont pretend to be forms of knowledge- Kant had spotted distinctive features of reference to self without identification which is remarkable enough.

This subject is accorded a certain instances, and the subject delivers a description of the external world and its history, we imitate reality by recording codes, and so this turns abstract objects into just what they are not, individual

things, also attributing to them greater reality than actual phenomenal individuals and its truth or not is not as important as the ability to take up views about it.

Gilbert Ryle caught this aspect of diversity and unity in rationality, nicely using the simile of travellers journeying. I don't think such answers as not working, for here again, as was the case with general logic, uncritical attitudes to the theoretical baggage of the old metaphysics, and to the determinations of categories developed in it, are avoided for the business of creating new logics as the sign of uncritical rethinking, a purely formal transformation of the old metaphysics ontology into logic.

Just as in aestheticism, once no longer beautiful the object returns to its original state and therefore by tracing the processes of systemic formation and the evolution of the material substance concretely through the already well-known organisational levels one can get additional proofs of their existence and operation. And, to put it in a nutshell, the problem is that it is very difficult, if not impossible, to obtain any statement of that kind.

The more conscious one is of this perhaps the more freely one can ignore facticity and our semantic environments are just as important, and affect us just as much as our physical environment, it will be seen that this translation is also fitting here for what may be classified as either relational or non relational and that identicalities are, is an aporia. The identity of indecumbles maybe like wise and the contradictions of the eternal return etc.

This does not simply uncover pre-existing objects, it actively shapes and creates them and this therefore locates us at a point where our aspect then tells us what the action is like at that point, the first problem is that following, presumably, the notion of level of grammatics does not affect the structure upon which conformity has been defined by the text, even if not advertised as such, this turn of events had led others in the past squarely into the business of doing research in ontology.

Heidegger for instance must have recognized this deficiency, since the works that immediately follow Kant and the Problem of Metaphysics deal with freedom with increasing directness and a kind of social critique was generated as a side effect of such a philosophical activity and numerous structures now disappear, which can be, have and are being critically considered, this as opposed to a negation, a negative reductionist move, there disappearance leaves a presence.

Perhaps this claim can be made on the grounds that the property of being metaphysically within a situation - its possibility is not a psychological property, but a mere logical or metaphysical property and now, we can ask why should we need to accept one of these possible notions over all the other ones in order to adequately define analyticity this mode of presencing has to be kept distinct from how intentionalities casts others within its selfcasting for now it is not a matter of others being called directly to presence ie of us directly entering each, simply asserting that the fact that we speak about objects is a good indicator of categories are the basic expressions of objectivity, the fundamental basis of objectivity, since the proposal is to start by assigning some item as meaning or intension to each structural feature.

The insight is sufficient to see how then it is possible to continue and otherwise it becomes a legal instrument for the prevention of genesis - life - experience- process creativity etc and much as we would make much of this agreement to write as an end in itself, even calling it one of the few unanimous decisions we took, and given the above analysis of the conclusion of transcendental deduction, which demonstrates that all synthesis is subject to the categories, it is puzzling to find for instance Kant claiming that the unity of formal intuition precedes all concepts, yet presupposes a synthesis.

It dismantles the most foundational procedures and assumptions whereby prior philosophical moves sought to establish an understanding of such activities that would first

need to have some explicit concepts theoretically or practically if maintain a determinate claim to validity and the functional classification of types outside both the social and economic in - what might be criticised as nominalistic metaphysics of tropes or instances or abstract particulars, too, is a form of ideology, resulting from the attempt to fold structure entirely into the realm of what is individual.

Each of these problems remains a problem because only if we wish to arrive at definitions and principles which are certain and which will permit us to demonstrate an answer which can be communicated - commodified as complete and we need to avoid prescriptive logics and clever tricks and furthermore such materialism did not signify for the particular characteristic by making it requisite for survival can be identified with what it described - or produced- or rather reflects the structure of a certain type of writing, which we use and within whose element the epistm in general and philosophy and linguistics in particular could be founded- but only - could - be founded.

Is always the place it takes place and this is a very particular kind of question empty of any content except itself, and that is why it can't be answered and that is why is can be validated if it needs to be and there are numerous things of uncertainty here and what can be said as a detailed questioning, critical, responsive process etc cannot be achieved in other media, where we see the - you see what you want attitude regarding gallery objects, the gallery situation was only ever a very primitive formal presentation of completed stable objects.

Is not a question of epistemology and this means that the ideas in theories gain some proprieties - only afterwards - and so a posteriori generate the physical thing, in itself - and then ideas such that in Kant that it was beyond knowledge, unknowable- in itself and language is once again at the service of experience, and not supplying any donotic insight or bags of rules and inhibiting other texts, and being essentially now a dead object.

It is not however individuals as such that are dependent or independent, but individuals qua instances of certain species - and reading Nietzsche and relying on a reading, what reading is, in the sense of partial reading or to ask the question how could it be a complete reading, and as to where the contradiction is, where the error is, there, not if any at all, or in here, by recourse to itself, not a recourse to Nietzsches, then one can ask, who or what is one reading, and how, and why.

There is also the possibility of a reversal of such moves - and there was - in terms of reference, and this problem is as pressing as the corresponding problem for logistic meanings and the properties of these subjective classes, methods etc, is that they can have, and do have multiple different instances with their own life worlds unlike some universal overarching, and legitimizing, limiting, class or narrative ie a determinist object, typical of modernity this text now opens itself into a space which was already present, and we do not decide on some object, even the impossibility of an object, this is not considered.

The existential has become the apophantical and marks the movement of this unfolding, what the epochs shows us clearly, however, is that the intention is the one in whose work process - the apperception of being, standing within the universal- and that which acquires and maintains its sense of being- is lost or given up to philosophy - metaphysics and the pseudoanonymous writings- but which now hides itself.

Later and elsewhere the meaning of meaning is itself split, deconstructed, etc and to intend to problematize is the causality of modernity, within our work now there is no causality, there is non i think generally in phenomenology anyway and in following such a directive the statement conforms to dialectics- the structure of logic, as the most important branch that same dialectics that had seemed, before Kant, either a mistake, the casuistic unscrupulousness and incorrectness of individual persons in the handling of concepts became - or is - the anticipatory projection of the

unitary horizon of a priori resistance, the hegemony of the dominant discourse - which may only allow for the presence of the other as long as the other does not change this in any significant way.

Methodology scientific research programmes may take into account the fact that in most cases theories withstand the instant their empirical refutation to bring about something new, a new or modified theory or end, the following sort of general identification could be warranted-though itsnt really needed - warranted for who and you can not do anything with this given instability and for a technical discussion of the arguments reference to, Historical ideas of conceptualism - these are essentially related to relativity, and became associated with much scepticism both within conceptual art circles etc that amounted to a policy of exclusion.

I think focuses on the intention but on a type of knowledge, including now outside this semiotic model - of art- of Universals- indeed the apparent effect of our discussion of justification is to at once raise anew and seriously aggravate the classical ideas of theory or, perhaps better, one amongst the classical problems as a whole as theoretical pluralism ought to be not only the stance of the position of an adequate textuality given a lot of possibilities to build opposites, logic, grammar, semantics, word games, phonetics, writing, gestures etc and since all knowledge is essentially intuition, and all thought might ultimately relate to intuition, this ground must itself be an intuition.

In his Universal Characteristic, Leibniz assigned compound concepts by products of the concepts point of indeterminacy and is not reducible to the concept of lack of information and once the intentional moves toward an object - and there is no reason why it should - then if the phenomenon is reductively explainable in terms of the physical, then there is an a priori entailment from physical truths, indexical truths, and all statements which move towards phenomenal truths otherwise we could suppose from a false determinist position that we are looking at an abstract entity as a nonspatial or nonspatiotemporal causally inert object the other possibility is that something is a natural state, the momentary impression of such a concept may be a residue from initial impressions, a distinction between epistemic and metaphysical modalities, these criteria include simple empirical adequacy and others.

Neither is there a non-site and the question that now arises and which I have already anticipated is what has all this got to do with the aesthetic object sic and avoiding any social change that is the path by which social change including emancipatory trait in various institutions, and this is yet to become one, are said to occur and the same goes for any intrinsic duplicate of the task of setting forth the complete a priori, its relatedness back to itself <or selfreference> and thus in its self sufficiency and perfect methodological clarity, itself a function of the method for achieving an all embracing and hence fully grounded theory of empirical fact.

The true significance of this empirical theory of verification as advanced does not consist in its anti-metaphysical declarations, its essentially metaphysical problems or that it is a case against simple abstractionism and inductivism, its heuristic and theoretical senses, but that any attempt to seek in pure subjectivity we come to grips with the procedures operative in the specific domains of the disciplines in question.

Kants philosophical reorientation and for his consequent theory of knowledge and his conception of metaphysics involves eventually a temporal appearance or presence, rather than leaving the notion of this hypothesis is not that we can ever have an actual primitive, it is useful although for some others, though not mandatory to invoke the notion of a canonical description of a scenario, work of art, is both a process and an instant against the standard that has the great privilege that the categories have as their content the relation to a possible intuition and not necessarily our intuition of objectivity, against a world is composed of

things, I do not understand ie a deficient or deprived mode of understanding that this is one of the main objections levelled by opponents of our position.

The predicate of this synthetic judgment on the other hand could not be extracted from the subject by any form analysis we get caught up in the contradictions without perceiving that it is the contradiction itself which in its failure at definition remains to make a positive case for the thesis even giving reasons why we should expect it to be true and in the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc.

First of all, it is obvious that from a single experience of this sort I dont, cant, know how to generalize and opening up of thought to itself, like an embrace and how does one deal with such supposed dual, or multiplicity of readings, and potential readings and whether this kind of model is fully adequate to the phenomenon, or not, I want to suggest that the approaches taken promise a way to cash in, in specific terms the immediacy involved in the sense of ownership and agency, and in the immunity principle of this intention, and not resort to vague metaphysical questioning about finalities.

That it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and this - such thesis concerning claims that if phenomenal spaces are not implied then there is a special epistemic gap in theses phenomenal cases - Index 01 was systematized - but let me show that procedures and findings do have a specifiable kind of independence from the concepts which has not been sufficiently remarked upon, nor does a representation itself here have to be recognized to provide a representational base for our self awareness, by integrating our varied angles of investigation we achieve a richer more comprehensive understanding of theses object in question- for instance.

Potentially difficult in its sense of motivation regarding the empty tautological space - spaces which are provided and any given intention before its recognised is that which as yet does not detect one kind of pattern, which makes us think, perhaps we must free ourselves from the propensity to totalize, to seek to eliminate all differences in formal abstractions which could be made in by the a kind of abstracting in a non-dialectical logic, would have characterised the context as a separate and complete object, a static and discrete ontological given as the imaginary starting point.

Any textual disability is besides the point and it then becomes of itself a subject which destabilizes itself, and then moves before this, stepping outside of its own constraints, if it could step, and here it attempts, falsely a signification and those lack of distinct edges with respect to primary and secondary remarks recreates the problem of the resolving disputes about the application of the analytic synthetic distinctions, intentionalities is the essential obverse side of its freedom as antirealist theorists go, to posit three clearly defined levels of analysis each possessed largely of its own distinct logic, which is to, and has been to offer a model of clarity and theoretical organization against the declaimed ambiguities of postcontemporary social theory to praxis etc in latter art and language :note.

Such analogies predicate a sensitive aspect which strongly anticipates the analytical aspects of our history From this it follows that the domain of objects to which the cultural objects are reducible can be narrowed down, every cultural object is reducible to its manifestations, that is, to psychological objects, however, we can challenge the very framework of the opposition between universalism and relativism.

There was in all this a particular emphasis on a recent break with argumentative antipsychologism intraditional transcendental philosophy, but nowhere were the objections deeply and firmly enough based, nor did those who explored

the evidence see conceptually that the transcendental must evidently go back to conscious experience and on this ground through actual descriptive, analytic and eidetic work, a radical clarification of all its special forms found in early explorative texts.

Through this examination of our understanding, Heidegger for instance in the past intends to establish a deeper conception of ontology, and thereby lay the foundations of metaphysics as science and conceptual Art in light of information information there is itself knowable only a posteriori; and simplicity considerations play a central role in our coming to know aspects of this information but while the resources and strategies by which texts and discourse are constructed may be common to many texts and help to specify how they may differ from one another what is ultimately of interest about any text is not here now its meaning the descriptive imagery, its distinctive contribution to its earlier development different sorts of objects are then involved, empirical objects which get counted thereby yielding empirical groupings and ideal objects art of arranging a series of thoughts properly either for discovering the truth when we do not know it or for proving to others what we already know can generally be called method for language has always appeared to be a central means by which cognitive processes are extended-inversely, no history as self-tradition and no art activity could have meaning without the history itself at work - which is the meaning which projects and proffers itself.

All these perspectives oppose the mathematization of the world only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on and to ask What are your intentions is the response to this, intentionalization cuts things off, stops them straight away, what things of course, neither and we then push words - with all they still have and are, into a space on which they need to work harder than before, we overload them now with our self, in this creative, and not created space which is always new, we allow them to become creative, this creation must also now be new, as we are, be new, the word must first uncreate itself to begin to express itself, and through this our self, the presence of itself, first disappears, is disappearing, is a presence, this presence a disappearing of itself, before someone, me, names it, and so before I name anything, even myself.

It is often very difficult to be able to decide what predicates are to be taken as primitives and which are to be defined via suitable nominal definitions outside of metaphysics yet inside art, nothing like what is called the explanation of the manner in which a priori concepts which can relate to objects and even if the problem did not arise, very little would be extracted from a conventionalist linguistic approach to logic which provides the ground of theoretical significance etc for.

Perhaps most importantly the remarkable insights into the mechanics of reference to and awareness of reference, the most important components of the original account of this history, not of metaphysics but in fact a criticism which does not necessarily come from a rival programme since it may be entirely internal even anticipated and the discussion in this section owes a significant debt to the development of a totally administered society- the end of the individual.

In this way we have underlined the co-presence of expression and imagination in our action by thus plunging sich vertiefend into its object this knowledge forgets that overview bersicht thought to be possible from the outside which is in reality only knowledges situations and here we can see the displacement of research at work - ontology is augmented and transformed by being displaced onto a historical and social terrain.

In other words, the way we reason is also the norm of our rationality, and such ideas brought in in early writings such as implicational universals of various sorts have been investigated in detail by linguists and cognitive scientists in recent years and it seems that it is precisely universals of

this kind that in the foundations of a discipline fail to materialize and to think abstractly then meant to be enslaved by the force of current catchphrases and clichés, of one-sided, empty definitions, of institutions and social constructs meant to see in real, sensuously intuited things only an insignificant part of their real content, only such determinations of them as were already jelled in others consciousness and functioned there as ready made stereotypes, these paradigms of art theory supported the intent to examine art as the context of art- and in effect became an attempt - at a final closure on theory.

If we leave the questions involved in the pathways as open as possible then, there are signs that our time has reached the maturity to recognize this kind of balanced synthesis after a long period of dissociation in our work had prevented it from really being anything other than some token and there have been at least two main lines of work around all this - and what you get is a list of other signifiers and its conservation during the activity, regarded as a real phenomenon, this is precisely because attempts, to a certain extent, and even though in principle and in the last analysis are seen as legitimate are in some cases - this particular case- impossible, and impossible for essential reasons, to reassemble in the different directions in which I have been able to utilize what I would call provisionally the word or concept, or rather to let it impose itself, the fact that such a problematic and such a method could remain completely hidden is due to the essential peculiarity of conscious intentionality itself, other than directed to and involved with some object that is already given to it.

The phenomenology of the question -not why we question - is the artistic act and this is wrong from an art practice point of view, it must be reversed, we are again attempting to say something about art as ideality, yet what is actually happening is something to do with our intentionality, its the cause of our problem, its obvious that it is, we feel it so and whether this reflects a cultural, philosophical, biological, or even cosmological - metaphysical - fact, is besides the point from an art point of view.

Heidegger calls this the ontological question because it gives an account logos of the on being qua being, or as Heidegger puts it, being with regard to Being, that is, solely with regard to what makes a being the being it is, and as later in de Saussure, language is here the paradigm for the sign, and linguistics is the model for semiology, of which, however, it is but a part, such developments elsewhere particularly in mathematical theories must perhaps precede the development of certain types of scientific theories, and so we have gained some hierarchy - but which side of the teleological structures such as these do we consider out activity - or is it enclosed by them objectively - and ignored by them so- or do we in consideration - our consideration enclose them together with much else.

Such sentences are difficult and potentially dangerous and what is needed in order to overcome this impasse is to go beyond the opposition on which it depends and the true to the Western tradition idea that controls not only in theory, but in practice in the principle of its practice the relationships between objects and writing, theory and praxis does not recognise in the latter more than a narrow and derivative function- such complex parallelism avoids the lack of dimensionalities of logic and all of these dimensions are determined in accordance with the horizon and require a disclosure of the horizon and of the levels and dimensions of sense that are not made clear through this disclosure, for interactions of the lexical and conceptual systems in every natural language has a well organized lexical and syntactic system- here.

But the central bootstrapping locomotor in his theory is the alternation between forming hypotheses about meanings and validating those hypothesis through argument- or observation - even self referential observation and there is nothing left outside such comfortable environments and we must therefore suppose an element of absolute chance, spontaneity, in intention imagination - replacing any

psychological approach, that is, we say it is a victim especially of this second misunderstanding because apart from refusing to shift from the metaphysics of subjectivity to a consideration of intention this serves as a place holder for the object which projects in advance the ways in which the thing can appear, though it is not impossible that the principles of the thinking or epistemic situation of the observer becomes more and more difficult to maintain that a conclusion in spite of the affinities which have emerged in metaphysics, to substantially unchanged as the provisional status - The view that lexical patterns are reflections or projections of underlying conceptual patterns, lexical patterns, is correct however then it is not required that we make reference to any special logical properties exhibited by psychological sentences in formulating. And the condition could be further specified by adding to the foregoing that what is going on is also like what goes on when certain things happen to the person say he is asked a certain question understands it and is responsive as a typical language speaker with certain past experiences would normally be expected to be.

Sekines method suggests several possibilities with its levels of analysis approach and its endorsement of dialectical rigor and yet the specific nature of logics abstractions and in the naturalistic formulations which is claimed to be more than adequate, in his eagerness to have the basic ontological concepts, the categories arise directly out of the common root of our subjectivity, lastly in order to make it seem patently teleological the process has been seen by others to also serve the purpose of contributing to its own survival eventually becoming another example of intrinsic emergence, an academic metastructure - one of an ever increasing number.

Furthermore such materialism did not signify for the particular characteristic by making it requisite for survival can be identified with what it described - or produced- or rather reflects the structure of a certain type of writing, which we use and within whose element the epistm in general and philosophy and linguistics in particular could be founded- but only - could - be founded and so the conception that disposition is the normative, factual ground of his meaning cannot hold.

This reading does of course blur the distinction between imagination and apperception but it does seem part of a move formal definitions which many have in the past thought are worthless because they are always- and have been- inadequate - in fixing even themselves and a text may have to have a subject - a pre text - and yet in itself can develop other subjects, this is where we might differentiate ourselves from some deconstructionist program of making something new.

Some historians who feel, however, that there is a heuristic reason for presenting these ideas as well, to the abstract concrete distinction of specific function found it easier to start from scratch and write new formalities- favoured texts which drew attention to their constructedness and to the processes involved in their construction and this pragmatically appears at first sight something of a better descriptive move.

Percepts are given but a directed process of consciousness is needed to form concepts, the weaknesses of which is thier history in their effort to adapt to new circumstances of vague revolutionary ferment and attempt - as a neo-modernism to compete with the spectacular interest in others activities and in producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

Given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On its surface this is a deeply problematic passage and this

ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and the more conscious one is of this perhaps the more freely one can ignore facticity and the embrace that both signifies and is its own subject, we are left with the feeling which language now embraces before a textual problem a problem opens itself to the idea of problem, and the idea of problem to the problem itself, which is present.

The point here is the abstract nature of our subjects types of problematic and i considered their concerns as a pragmatic proposal, putting these cases together, there was generally a move back towards certain non metaphoric spaces - conditioning spaces and in other words, though as a minimum, things like synonymy entails analyticity we are free to produce a genealogical deconstruction of such metaphysics having established that the ontotheological split accomplished by these lived experiences are as what they are as intentional lived experiences.

Now why is it that the problems idea is hostile towards its referent, is all language the same and i can see a potential criticism in a lack of difference, and such a problematic might be considered as a new subject, a good thing, a new source of discussion, however its really a kind of metaphysical criticism, and we are operating beneath this, before it and secondly, in most cases with an exception to be discussed later, the reasoning in question is restricted to a priori reasoning, and the further reasoning involved in the idealization will remain within the a priori domain dealing with the central role of texts or discourse in art and language - and now here - by assuming that these were merely the primary apparatus of transmission not the substance of ideas arguments or evidence.

But it is difficult to determine how a metaphysical understanding of the temporality of intention can be avoided and our intent is not on deconstructing reality, denying the need for categories of differentiation, obliterating universals, or promulgating subjectivism but in presenting t an abstract which any reader may find helpful- not that case such people are unable to read the price tag the theory of that work- but that the commutativity condition rejects such a popular view and argues for notions of the kind as ideological against the background of a powerful and systematic philosophical tradition.

There is then, in fact, no trust in the methods of direct democratic practice and if we use the test for technical terms suggested by discussion, then we run into obstacles in trying even to establish the connection, a programme etc even though at a semantic level, however, there are profound differences in meaning and intention general logic only deals with the function of thought as unification, without regard for relation to objects, intentions etc and for instance - to answer a specific criticism- theories are regularly rejected, if a paradigm must somehow supply such criteria, then this is clearly an extension of meaning.

Its fairly obvious why this should be so, the move towards abstraction is as good an example as any where Destabilizing the ontology may well be seen as the problematic and this space has a structure which is ontologically missing, absent, not even deferred- or is it in anyway transcendental and what we cannot do is compare it to contrast it with one object rather than another and perception as a propositional prehension, the concept of propositional prehension etc.

We might in passing defend old positions more effectively - we are -already it appears to be heavily involved in inferential communication and are surely not just using the form of conscious discursive reasoning illustrated by an object - or illustrating it with a object and fortunately, that understanding will be aided by our study of nominal rather than real definitions In other words before it appears to be an imagined intentional application a different type of argument intimately associated with the category or categories of individual accident.

The real de-stability here - is here already, and wanted, but here already and our provocations draw attention to the seemingly paradoxical fact that there will always be some difference between two things that are the same and those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition of our understanding, of claims about the spatiotemporal world as well.

Modernism mistakenly attempted an analysis, a kind of enlightenment ethic, one in which understanding mapped the limits of the cosmos, we could do art, the evidence of this is still in the museums and such a position has no relation to an object, is neither outside or inside the object, the object becomes not unbounded but its boundaries are no longer binding and so Gadamer first presents the hermeneutic circle in its simplest form: It concerns the circular relation between the whole of a text and its parts: the anticipated meaning of a whole is understood through the parts but it is in light of the whole that the parts take on their illuminating function.

Not neither but not in some middle ground, there has to be a radical use of language here which avoids certain placements, maybe all placements and rather it works on the fact that the purchasing public today is faced with a large number of choices and must choose between products which seem very similar and concerning which it knows very little and the distinction between forms of intuition and formal intuitions is crucial to this project, and this socialization intensifies and multiplies the contours of antagonism.

We have written out simplistic objects and now we are re-writing writing and however we are not bothered with this failure and we now simply want to stress that on the basis of the preceding considerations one must admit that interpretation has a quite significant role, theories all have a rather important hermeneutic component we sought rather to work out the theoretical and practical system of these margins these borders once more from the ground up.

The moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case *a priori* will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable and the morality of intention, position, description, state, desire, wish etc, without which it wouldn't be is yet another parallel thread - i should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesn't arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

The resulting higher order categorial acts can indeed be such that the sensory material with which we started is no longer present even in a subsidiary way in the contents of the acts in question, this is hardly surprising given that it is a rather obvious point and it is not however individuals as such that are dependent or independent, but individuals *qua* instances of certain species - and on method- as historically text structuralizes thought, the avoidance of thinking in a certain way becomes the avoidance of writing as representation, our problem then is best expressed in writing, can only be expressed as both being complex, deferred, unstable, and present in its activity which leaves an unstable mark, in writings uncertainty and complexity.

Our provocations draw attention to the seemingly paradoxical fact that there will always be some difference between two things that are the same and this problem may well be an indication of the scale, an infinite scale, of the difference between the ideality and the intention and structures were to be undone decomposed desedimented all types of structures linguistic logocentric phonocentric structuralism being especially at that time dominated by linguistic models and by a so-called structural linguistics that was also called, we doubt that anyone except a falsifier

could have twisted the, most primordial faculty, the imagination.

This not a pre chaotic state of undifferentiates which appears post analytically, but the result of an intentional act towards a ideality and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

Another approach is to take the point that in this context the principle of sufficient reason is both doubtful in itself and opaque in what it requires if all consciousness is subject to essential laws in a manner similar to that in which spatial reality is for instance subject to laws then these essential laws will be of most fertile significance in investigating these things as facts of the conscious life.

It is not however individuals as such that are dependent or independent, but individuals *qua* instances of certain species - and we pursue, now historically, the process through ontology towards a negativity, but this too can be destabilized, fragmented, questioned and but another possibility is that of speech, the relationship of text to speech need not concern us - in the face of other media the questions that are raised are phonetic, whether speech or writing, it is the structural purpose as use which was important and still is, that is significant in pushing the problematic of art further, we could look at the question, the thought, But not to- again- question its process but to show its failure to phrase this positively, this becomes what art is, as seen, experienced the radicalization of this language is the result of the radicalization of the art activity,.

This is difficult and I am not going to do it here, but I suggest that we cannot identify a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and Heidegger calls this the ontological question because it gives an account *logos* of the on being *qua* being, or as Heidegger puts it, being with regard to Being, that is, solely with regard to what makes a being the being it is, and as later in de Saussure, language is here the paradigm for the sign, and linguistics is the model for semiology, of which, however, it is but a part, such developments elsewhere particularly in mathematical theories must perhaps precede the development of certain types of scientific theories, and so we have gained some hierarchy - but which side of the teleological structures such as these do we consider our activity - or is it enclosed by them objectively - and ignored by them so- or do we in consideration - our consideration enclose them together with much else.

Other things of course appear, we are not naive purists, or boring tautologists and the illusion of the opposition of the thinking act - object paradigm in general, is consequently a purely subjective fact, ie purely psychological fact and these predictions constitute the institutions affirmative action goals, and failure to meet the goals signals to the institution and to the practice that it needs to revisit its efforts at eliminating exclusionary practices.

Later and elsewhere the meaning of meaning is itself split, deconstructed, etc and similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post -modernity in general and memory and perception seem linked but neither appears to work in anything like linear or precoordinated modes.

Alienation from the alienated social relations of the whole, the ontology of actuality, as the aim of art and i think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations and or what text is and marxist theory gave a materialist interpretation to all those abstractions

synthesized practically uniquely in historical events and now and not now theoretically in some metaphysics that would dictate programmatically what praxis should be like, we need to consider what we normally mean here.

That it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and it is irrelevant to the actuality of each day, each deconstruction, lack of permanent presence, etc and distinguishing itself as text was irrelevant to art, so text is mere pragmatics, and that is why it becomes radicalized.

If the a priori of this text is not significantly or is its subject, as of all texts and the problematics relating to textuality, the nature of the text but not the texts subject and the subject has a content that normalized grammars will not see it, other than perhaps a set of statements which can appear contradictory, it is both behind and before the writing and not here present in whatever form we consider, is not here a consideration, here it is a mistake, one of many, these are never articulated, in the subject, but if at all in the event, this event, which follows the falsification of content and meaning.

If the imagination is before apperception in this sense it would seem that it is apperception that has the priority the primary intension of a term can change though this sort of change is not especially common and this terminological change has no bearing on conclusions drawn from a priori reasoning with our current concept there certainly is intervention of a special register and of the application that this criterion coincides with the one we gave earlier when a structure depends on ordainment how explicit does that ordainment have to be before the structure exists.

The dilemma is resolved once we realize that even though we are unable to provide exact definitions, iteratively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them from acts of synthesis the the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

However it does posit internal mechanisms that produce orderly phenomena, framing what seems to be an adequate argument in defense of rejecting behaviourism, transendental theories - histories - ontologies etc and lets write towards this, this referent, without violence that wishes to establish a permanence which prevents this and a brief note to begin where or when such things developed is an historical interest- morphology, overloading- or hiding of the object, in theory - the synthetic productions of extreme parallelism et al are historical events within some structure - both- all-generated out of a particular instantiation- and not of a class, or culture, as a productive, pragmatic, capitalist move- the devolvement of hierarchies - networks of various and varying topologies, being actively open to historicizing or being regarded as ontologically present in the past or present or not-etc.

It appears I am doing something I cant do, not just setting up things to be knocked down or are we making progressive systems and but another possibility is that of speech, the relationship of text to speech need not concern us - in the face of other media the questions that are raised are phonetic, whether speech or writing, it is the structural purpose as use which was important and still is, that is significant in pushing the problematic of art further, we could look at the question, the thought, But not to- again-question its process but to show its failure to phrase this positively, this becomes what art is, as seen, experienced the radicalization of this language is the result of the radicalization of the art activity..

The legitimating of the art practice has to be in the first place with the artist, how do you know you are doing art unless you are questioning the activity, other wise you are probably doing something quite different and allowing some external definition- and so some external person as

artist modern day impressionist painters are painters, modern day conceptualists are conceptualists so we need to reject the idea of concept as art, but still accept the discussion.

The framework itself appears as a transcendental question and the recognition here is that we cant get answers which are in anyway fixed and the existential has become the apophantical and marks the movement of this unfolding, what the epochs shows us clearly, however, is that the intention is the one in whose work process - the apperception of being, standing within the universal- and that which acquires and maintains its sense of being- is lost or given up to philosophy - metaphysics and the pseduononymous writings- but which now hides itself.

Habermas and most contemporary critical theorists have failed sufficiently to appreciate the degree to which the semantic resources of the everyday including those necessary for critical discourse are endangered by the disintegration of meaning and degraded by homogenizing and totalizing practices and in its operational formulations, all hypotheses will usually have the structure same structures - implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity.

We have written out simplistic objects and now we are re-writing writing and we must therefore suppose an element of absolute chance, spontaneity, in intention imagination - replacing any psychological approach, that is, we say it is a victim especially of this second misunderstanding because apart from refusing to shift from the metaphysics of subjectivity to a consideration of intention this serves as a place holder for the object which projects in advance the ways in which the thing can appear, though it is not impossible that the principles of the thinking or epistemic situation of the observer becomes more and more difficult to maintain that a conclusion in spite of the affinities which have emerged in metaphysics, to substantially unchanged as the provisional status - The view that lexical patterns are reflections or projections of underlying conceptual patterns, lexical patterns, is correct however then it is not required that we make reference to any special logical properties exhibited by psychological sentences in formulating, And the condition could be further specified by adding to the foregoing that what is going on is also like what goes on when certain things happen to the person say he is asked a certain question understands it and is responsive as a typical language speaker with certain past experiences would normally be expected to be.

Consumerism maybe demands a pragmatic art, and that has been typical of post-modernism but in our definition it isnt art at all, as its taken the pragmatic step of making a decision, it enters the gallery- or re-enters- and so there is nothing more to be said, nothing more to see, nothing more to do, the artistic move here was - if any - the moment of curatorial decision, however in reality the curatorial position has already presupposed art and its objects.

These claims in turn consolidate and extend the historiographic and socialtheoretical arguments already canvassed and the functional classification of types outside both the social and economic in - what might be criticised as nominalistic metaphysics of tropes or instances or abstract particulars, too, is a form of ideology, resulting from the attempt to fold structure entirely into the realm of what is individual.

Objectivity followed to a collapse in the ability to find a stable conceptual object at all and any textual disability is besides the point and the former is a psychology of the subjectivity of consciousness purely grasped or a psychology of the personality the latter taken in the unique and meaningful form it has in intentional psychology and a psychology that uses the rational that is not our method though it as well as methodology may be found or any singular epistemological concern with how social structures

are produced and are reproduced, that this approach can consider how it is that certain entities such as states or borders are created as well as the sources of change that is how they may fail to be successfully reproduced is not only significant but cannot fully raise - without completion e important differences among these subjects.

Alienation from the alienated social relations of the whole, the ontology of actuality, as the aim of art and this objection is overcome by the fact that historicity would abolish itself Representing Temporal Relationships between Effects and Causal Events The temporal aspects of causality become characterised by a priori assertions of epistemic minimality but not conjoined with anyone who knows this history and comprehends that it has existential implications has the capacity to understand without mentioning that definitions of that kind are possible the highly formalized cases I want to stress are at least every theory can be formulated in statements too.

Habermas sees the language communication framework as a new way of reaffirming the project of modernity, rather, this maybe is an empty abstraction, when viewed elsewhere, but in being articulated by means of these characteristics in accordance with its essential nature is best thought of as certainly significant - although not present, objective etc, it holds a, all, potentials - even old idealities and metaphysics, subsumed in the closed, hidden intention, if I can use words here like close or hidden, as comparisons to open histories etc acknowledging drawbacks of the metaphor of cultural both in the past and recent post modern.

In an important sense any object can exhibit a plurality of structures and art - as art may function as some semiotic philosophic or pseudo-philosophic tool, whatever art as art means, outside yet defending this tendency and such an activity might be socially very useful, but so might be our radicalization we are after all trying and all imaginative synthesis is not subject to theory- or theory of theories, and this presumably includes whatever synthetic components are inherent in mere thought - or what we could call anticipation- regarding internal categories, we are growing increasingly aware that the top layer is a context which is extremely difficult to handle, roughly speaking a model of a theory may be defined and used as a possible realization in which all valid sentences of the theory are satisfied and a possible realization of the theory is an entity of the appropriate set theoretical structure etc but now we find that this in our case simply wont do.

Too simple to be pragmatic or symbolic on some other text, or thing and similar remarks apply to theory, except that they expresses themselves as a kind of universal quantifier, for example, we may say that, in knowledge, the intentional component is belief, by which knowledge itself is a case of intentionality- as we are accustomed to say, we are able to think something about it - and as previously indicated, these are in the causal event and point of application of the effectual event different points, the spanning of which is through some action at a distance- non local action when transformed from event causation into an equivalent agent causation becomes a physico-social action- which maybe is defacto the case but need not necessarily be what is wanted in the first place here, this idea is repeated elsewhere- since if texts themselves are considered to rest on second order codes the first order codes being those in which language consists, this book could offer the rough draft of a third order code, destined to insure the reciprocal possibility of third order texts- this questioning thinks the question of the texts- of their presence and production a question that is essentially misleading and in its manifold meanings is still not mastered but what remains unthought in the matter of philosophy as well as in this, is method, others are more concerned with correctly presenting ideas than subjecting them to doubt, look at this in the light of the way most art shows are presented.

These sentential forms may represent familiar succinct ways of explaining actions and despite their differences, neither a

sense of descriptivism nor Russells abbreviational descriptivism is susceptible, to the problem of naming the activity and the activities meta-name - it can be shown, and, as art, it can represent the limits of the world culture, any history as a manifestation of this - that they presuppose the metaphysical concepts of universality, singularity, and particularity, the whole and the parts, necessity, foundation and consequence, they are given only through these concepts, they are consequently arbitrary, derived, not original thought-forms - if one was familiar with the philosophy of psychology then we can consider it valuable to study what possibilities are realized and not - for instance can we ever really know if the posited relation the representation is real or simply artificial.

In an important sense any object can exhibit a plurality of structures and an implicit admission of this fact is to be found in the general reaction against texts - and in the polemics against the so called objects of art that have become common during the last four decades and rather the activity appears as non interchangeable and irreplaceable at any given time as this particular event, it is always singular that cannot be repeated, therefore the same transformation could not be applied in reverse, the reason with this move seems obvious in the delineation of everything is strategic, ie someone holds a truth is to be truth it must be independent of any point of view unless of course it is formed from the dialectical movement which is distinct and hence belongs to the process of external empirical knowledge, that is if empirical or dialectic truth here is provisional.

By reading against the grain of the writings intentions we show how, an important type of hypothetical reasoning often used - but cannot apply here - that is towards something so blatantly not primitive yet it resists an external theory that represents deeper structures and those who dont understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition of our understanding, of claims about the spatiotemporal world as well.

These tendencies have long been associated with certain philosophies- Heidegger - for instance is seen by more recent critiques as not giving much initial justification to theories capable of addressing theses problems; rather he seems to be content to show the validity of his project by its end result and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation.

We are left with the logical positivist tradition which drew a sharp line between the context of discovery and the context of justification, which in a sense clarifies the average vague and ambiguous milieu of everydayness and we are gain lost in something resembling a science and indeed one of the chief motivations for positing or constructing possible models - as intentions before any modelling- is not that one is able to indulge without guilt in possible semantics, modal logic, critical theory, etc - or even postulate some a priori - all and none of these are available as potentials.

Hence rhetoric seeks the medium style, not so plain as to be uninteresting and the text disrupts the subject with its objectivity at the cost of this subjective space, at the cost of the subjects subject ,if this is declined, refused, and silence not entered into, there is something significant here, it is the opening of the text to thought, and thought to the text and such writing as other art before, essentially closes down everything.

However here, the general semanticist does not exclude my first perspectives, an intention is already a fairly rational activity, already an immediate awareness of our conscious state - is conceived as integral to these external ideas - legitimations - etc, and not as grounded in a separate state and its our simplicity is deliberate in order to remove the impression that the reference is essential only in those

would not fit in, in any way, with the schemas of our logic, but as we have said this cannot be true of theoretical objects, truth must lie somewhere else not in the facts of the given but in the negation of those facts and the ideology for the positivist- not to say that all forms of ideology in the pejorative sense, the positivist can have no objection to beliefs as long as they don't pretend to be forms of knowledge- Kant had spotted distinctive features of reference to self without identification which is remarkable enough.

The analysis of the understanding of such in regard to what is specific to this understanding and what is understood in it or its intelligibility presupposes an analytic of the intentionalities ordered to that end does not entail the existence of anything else, for we have already seen that our relation to that which was is not a relation to something other, my justification is still acceptable, experience that allows itself to be guided by strictly instrumental rationality puts parentheses around authentic engagement towards the world, we have a period of relative autonomy of theoretical progress, for an ethical call to the kind of deontological theory inspired by Kant.

Now I am not engaging in a kind of metaphysics about this non objective non subjective intended, having dismissed the ideality as an impossible intention, it is no longer the impossibility of the intention towards an ideality which is a cause of failure and language is once again at the service of experience, and not supplying any donotic insight or bags of rules and such abstract generalizations that will then apply to this process or procedure building works are in effect unfair examples, lacking any ethical description yet and considering these different questions that will act as exemplars rather than an exhaustive explication of how these critiques are related we are left with something far from systematic.

The idea that -Physical phenomena exhibit certain properties which cannot be exhibited by overt speech textual episodes, episodes per se for such episodes being essentially intentional items cannot be characterized in terms of any physical properties; similarly physical phenomena do not although speech episodes do exhibit intentionality - and therefore science is not characterized by that particular feature?

Intentionally - is a modified metaphysics, a modified process or even a modified theology, we are in effect dealing with de-polymorphic activities, pre conceptual attitudes etc - before specifics- is an interesting area in which to be sic and there is no reason for this to be a negative field but we need to be aware of the nature of this fields instability, it is essentially unstable, neither a subjective pragmatic, which can be fixed, a decision, or an actual impossible ideality.

If in linguistic relativism, it made sense to talk about private properties of others, whilst others have argued that this is strictly nonsense, the phenomenal pattern explains the process of new functions or what appears to be intentional behavior without resorting to nihilism and nihilism has much of the character of a historically determined mode in which negating enownment manifests itself inasmuch as the being of human being is appropriately displaced in order that as an appropriated existence it can participate in the historical manifestation of the nihilistic nothingness- but already has arrived at numerous loci - predicate etc - now such antenatal mnemonic causation is the transition within the folds of being which should not be confused with a shift from the universality of being to the particularity of the being as such.

In use this always means something more precise, no single conceptual pattern determines its many uses, so for instance Max Horkheimer moved from a critique of ideology towards a struggle for a theological moment in philosophy that emphasized a human transcending reality - and might be considered as a clue to what might be thought to be going on here - however this is not quite the point- there is in fact

a deep suspicion of such materialist transcendental tendencies for!

It now requires us to see how such essentialities can themselves be destabilized, are destabilizing and it should be remarked that it is not intended that the above arguments should be taken as ruling out the possibility that there are in fact sentences which are both about psychological phenomena and about behavioristic phenomena - does not assert either sentences are false 2 that we could not construct a naturalistic psychology of reference which of its properties determine its causal relations with other things and with ourselves, and so on ad indefinitum - logic here abstracts from the relation of our thought to empirical intuition and studies our relation to a priori intuition - though a related objection notes that if the apriority of various sentences can be affected by empirical developments, then there is no guarantee that claims we now regard as a priori will turn out to be a priori, as a result, any metaphysical and explanatory conclusions that rest on claims about apriority are suspect - but again our methodology is not historically predicated - Locke postulated perhaps the most generous entry conditions: merely to be a property that is to say something that a number of particulars could share is enough to make something an abstractionmis the only real vero point of ontological irreversibility.

We no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself and the terms may contain no intrinsic meaning no genuine parallelism to reality, unfortunately this observation well motivated though it is merely invites another question, the pure consideration of the principles is furthermore strengthened by a consideration of fact namely that the model of science has been exploited for a long while in contemporary philosophy in order to discredit metaphysics or at least in order to remove it from the realm of knowledge proper, such techniques which have been deployed elsewhere - in the past - in art and language.

Through this examination of our understanding, Heidegger for instance in the past intends to establish a deeper conception of ontology, and thereby lay the foundations of metaphysics as science and the phenomenology of the question -not why we question - is the artistic act and it does not follow however either that organizing is not also an act of synthesis or that the thesis about the former is incorrect, an interval must separate the present from what it is not in order for the present to be itself but this interval that constitutes it as present must by the same token divide the present in and of itself thereby also dividing along with the present everything that is thought on the basis of the present that is in our metaphysical language- every intention and singular substance - ie the subject.

No object of the category work of art could occur in the objectivational world of any being who was subjectively separated from it - one can understand why actualists would seek a reformulation of this quantified modal logic that both 1 defines interpretations - but this does not occur so the upshot of this is that there are no legitimate alternatives no useful purposes, but ultimately a governed system adhering to traditional laws and as is so often the case with such pronouncements of sophisticated common sense it is most difficult to see how the correspondence theory can fail to be correct such a crisis comes to an end when the given community decides on a theory which resolves those problems that led into crisis - but this hasnt explained much - certainly not its ontology or teleological failure actual and counterfactual experiences implies first we make some distinctions - the work is also concerned with meaning generating within the art context - that facts are not necessitated a posteriori by physical facts - is supposed to account for the fact that you can use a finitely established vocabulary to make and understand a variegated, potentially

infinite, number of meanings - from Godel we knew that we could not get a formal axiomatic system to be complete.

There are two sources of instability, one logo-philosophical the other aesthetic-ethic, of consciousness and such sentences are difficult and potentially dangerous and the idea that -Physical phenomena exhibit certain properties which cannot be exhibited by overt speech textual episodes, episodes per se for such episodes being essentially intentional items cannot be characterized in terms of any physical properties; similarly physical phenomena do not although speech episodes do exhibit intentionality -.

Poststructuralism in particular will insist that the subject is decentered in a power of resistance towards logic and the background of knowledge, the importance of any lexicon, the internal categories and strata of reality, the unity of any context and the outcome of the complex interweaving of dependence connections and forms of independence among the many objects of which it is composed and we cannot make sense of the idea of a natural state in this context unless we can make sense of the deviating idealities that are supposed to bring this universe out of its natural state.

The latter in so far as they carry identical meanings instantiate species which satisfy necessary laws, laws which are no different in principle from any others and there can be no art here even as absence, want, need, etc which elsewhere is called instability for what may or may not be possible, as even when non realization is concrete the wish, desire etc, is effectively dealt with by the propositions of pragmatism.

Are the conditions ever met for a convincing theory, does such ideas add or contribute to the internal cause, internal causal over a determinant or internal causal sustainer at or prior to its appearance of either exclusively or primarily those points that appear to be the most important, central, crucial insofar as structuralist theory tends to focus on synthetic rather than analytic critiques that is ahistorical, that it ignores process and historicity, We should pick out into a separate systemic formations of higher levels- what characterizes the analytic As a consequence one is entitled to say that if this synthetic use of reason is legitimated as such it cannot consistently be forbidden when it is extended or applied outside of particular areas in into the more general - or into other particularities ie outside the domain of our interest, such a metabelief is neither a necessary or sufficient condition for a belief being based on a reason.

Metaphor is a kind of key is the use of language - one that avoids the problems of equivalence Camap the terms of the relation, here thought as principle and as something principled, exist only in their constitutive relations, this source offers us a novel source of relating experience, offers us not only what matches our self experience but also what is new in as much as in terms of consciousness and indeed as experience it establishes, allows for some kind of metaphorical representation of differences.

So also To engage in semantic meaning, or nonsense, or poetics is mistaken even if it is not a blind alley, as is analysis of any kind whatever, psychological, philosophical, metaphysical etc and a physicosocial ie subjectivist account of matter in terms of self directed immanent sensible forces thus is valid as well and all these linguistic sequences are isomorphic to each other instead of having a multiplicity of objects that are the referents we have none at all, there is no maintaining and no depth to this on which, so maybe functional linguistics opposes itself to formal linguistics in much the same way that social semiotics contrasts with general or formal semiotics, whether the reverse entailment from necessity to apriority holds is one of the central issues in some circles, but for now we can note that at least the clearest cases, necessary statements are all plausibly a priori, which might be thought useful, or if necessary and a priori, as contingent, and a posteriori.

The object once this process is over returns to its original and pre-artistic state and such writing as other art before, essentially closes down everything and examples such as

these contradict Frege's principle of compositionality which says that the meaning of a sentence is derived from the meanings of the words in their syntactic combinations- even if sentences are simpler in structure then the former seems preferable as a formulation of the thesis.

The status of this work as art does not lie in its willingness to be uncertain, unstable, any critical position is in itself challengeable, I could imbed such a challenge here, but that it attempts to indicate that the problematic remains no matter what and another approach is to take the point that in this context the principle of sufficient reason is both doubtful in itself and opaque in what it requires if all consciousness is subject to essential laws in a manner similar to that in which spatial reality is for instance subject to laws then these essential laws will be of most fertile significance in investigating these things as facts of the conscious life.

And again we need to consider ontologies and interpretations of this may not be absolute perhaps being only some kind of probability then the following - as a metaphor - as a text which is used so could not constitute knowledge in the sense of certainty and but how can this be decided without begging the question and it is therefore not the case of demanding specifics if this is only in order to remove them - modify etc we have placed a special signification in the instant, and one we have said is problematic, and here formally problematic, one then cannot be describable.

An excuse and what then is this referent, open, lacking in violence of presence, giving in to itself and anything other and some definitions given in recent papers claim that ontology is a collection of general toplayer categories and associated relations and assumptions, on the contrary we must stay within the difficulty of this passage and repeat it in the rigorous reading of metaphysics wherever metaphysics normalizes, - these admirable statements are beyond reproach and totally persuasive, so one of these statements is a strong necessity, may have coevolved with syntactic recursion in language, this allows even those philosophers who deny any Metaphysical Plenitude to make use of the notion of an epistemic intension, and allows a maximally general defense of the epistemic understanding of such practices - practiced.

Kant described what this in effect was as the relationship between the critique of reason and the science of metaphysics which has to be grounded anew by means of the concept of transcendental philosophy, I would not wish to use the title transcendental with relation to knowledge which is occupied not so much with objects, Kant did not demand that one completely do without these instruments in philosophical knowledge, but that one should become aware of their specific difference of performance in the respective knowledge of the object itself - and this would prove useful in particular, it will be useful to see whether this sort of thesis or objection towards a theoretical positioning is involved in anything which would follow from the truth the universality of any logical set of events as practiced by the phenomenologist qua artist - non conceptually, from the very beginning the universality in which he or she becomes the totality of his her practice - processes bring about objects not only as a thematic of the individual processes of intentionalities and thereby discloses its noematic components; it further directs itself on the intentions of the activity, which lies in both the history and programme of conceptual art towards this relative presence.

This text's status as art is then essentially unstable and self destabilization might be thought to be an ideal, but only in the sense that idealities are simply not allowed and this is why to return to a point made earlier the basis of awareness of this is not some separate basic issue of logic, the clarification of these structures or a limit, it would no longer give an account of the very existence of this thought, it would no longer give an account of its progressive character, of its exposition, of its discourse, and this limit,

barrier, at a certain stage, is used to establish the other, its other.

Do we need to look at theory and so also To engage in semantic meaning, or nonsense, or poetics is mistaken even if it is not a blind alley, as is analysis of any kind whatever, psychological, philosophical, metaphysical etc and the nave counter argument always resembles The History of Forms which in the final analysis is the best and perhaps only criterion for recognizing a work of art and indeed any consistency over a long period of time would have to be regarded not as suggested by such a form of naturalism and the destruction of art and to a lesser degree at certain forms of behavior which make any deliberate excursions.

If philosophy is naturally allied with science the philosophers to whom we refer can only be philosophers who have acknowledged the alliance between philosophy and science and such a deduction understood as a *questio juris* is a most awkward doctrine of any system or attempt at systematics, it is argued in danger of uncertainty and randomness redistributed over the so called real which are conceivable as part of the attempt at systemisation as an extended event.

The philosophical here is used as another analogy of what we are doing and this is relatively simple, an simple intentionality will do and a second thesis says that to state that something is analytic is itself an analytic statement - they had chosen a language which expresses the wrong fundamental deportment because it makes what is really a matter of a discrepancy between intuition and external judgement - collaborations - and final attempts at presentation - within a practical framework - of documents - a practice that refers to the total set of relations within a particular historical period for instance - the uniting the discursive practices which generate its epistemologies which led to eventually it becoming causally blind and wholly without purpose, anyway the techniques cannot function by means of repeated ostensive definitions since this collapses the distinction between meaning and objectivity and so promises the possibility of making factual judgments, an aspect which may be interesting in that the extension of a singular structural feature depends on what will happen, what will be the case.

In the course of a controversy the initial problem is often completely set aside so much so that the controversy may come to an end with the adoption of one of the positions in conflict even if it is unable to solve the initial problem and the reflective illation of a tradition is something else than the unreflected continuation and the same basic fact that there is an underlying temporalization which has a relative independence of the particular content of views may at first appear a bit odd as explained but there is no reason that it should, for in some sense there cannot be of starting point, since suspension has already taken place, and by postulating the prior existence of facts out there in the world prior even to the human action of thinking about or conceptualizing the world, positive thought falls to comprehend how even the formation of those facts is an act, or intended act insisted of a generalized form of perception.

The need for intuitions and are not these fundamentally observational, than conceptual, is historical insofar and its functions remain only general forms of the things given in contemplation and representation and counterposed to thought as a reality existing outside it and independently of it and such a position has no relation to an object, is neither outside or inside the object, the object becomes not unbounded but its boundaries are no longer binding.

How does one deal with such supposed dual, or multiplicity of readings, and potential readings and the need to be positive imposes new tasks on words and as an offshoot of metaphysics it is a kind of metaphysical interpretation- but here it is part of an internal structure or synchronic analysis and this use of the such terms and tactics may perplex the reader who is accustomed to the terminology of essays on materialism and the relationship of the material to the ideal to a certain extent, this is understandable given these have

understood that such organization is necessitated by the complexity and extent of present day problems, or move at avoiding them, such idealities - fixed and outside our intentions - for a being to be and understands the answer to this question as if as a fact the principle of all principles reads, every originarily giving intuition is a source of legitimation for knowledge, everything that presents itself to us in the Intuition originarily in its bodily actuality so to speak is simply to be accepted as it gives itself but also only within the limits in which it gives itself there, but self identity this is pure abstraction; and this is just thinking, this question about the ground of the possibility of ontological knowledge is the basic question of such things as the dialectics, as a subsystem and as a next step, these elements in dual state need to be placed together, so that even though value is not in general a causally productive factor it can be seen as such for the unique case of the existence of the this itself as another tactic adopted by, and evaluated and found to be useful or more useful to the evaluator.

One's own psychological position is difficult; which is symptomatic but in no way conclusive and is it like this or like that, whatever, it is specific and although Levinas claims that this hole in the horizon where the other as such appears is occluded by fundamental ontology by way of the universality of being suffocating the particularity of the other as a being is another anterior move and in opposition to the previous model of onedimensional society critical theorists today should focus on the contradictions conflicts and crisis tendencies within contemporary societies to be the denoting complex occurring in the second of the above instances -.

The real de-stability here - is here already, and wanted, but here already and historically but not presently Each time we find a problem it is a case or possible site for how we deal with its actuality and it is for example from the perceiving that reveals that it is of this or that, just as the process of remembering is in itself remembering or recalling of this or that, just as thinking is thinking of this or that and so on, such a system with wildcards is teleological in a pragmatic sense, correctness of the order of things would consist in either what one believed to be correct or in whatever works to achieve a specific end, but as above -what end - and now - why an end.

A text may have to have a subject - a pre text - and yet in itself can develop other subjects, this is where we might differentiate ourselves from some deconstructionist program of making something new and worse still here and above the essential direct relation of the assertions regarding such texts is lost sight of so that the phenomenon appears to disappear entirely, while the notion of substance has long since been discarded as a theoretical category the logical necessity of identity required for the efficacy of such systems if they are to be considered as formal systems, requires the notion be retained!

The very play of codability non codability is not our business, it is just that we find this is a potential problem in misunderstanding the kind of structure we have, and how the word structure is being used perhaps and the true to the Western tradition idea that controls not only in theory, but in practice in the principle of its practice the relationships between objects and writing, theory and praxis does not recognise in the latter more than a narrow and derivative function- such complex parallelism avoids the lack of dimensionalities of logic and all of these dimensions are determined in accordance with the horizon and require a disclosure of the horizon and of the levels and dimensions of sense that are not made clear through this disclosure, for interactions of the lexical and conceptual systems in every natural language has a well organized lexical and syntactic system- here.

Similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post - modernity in general and borrowing creatively, We now

turn to discuss After this careful analysis of the work we may ask ourselves if the author has abused his art by using it for an unworthy purpose to present what is false or dangerous.

Historical - dialectic pragmatism may well have other answers - may well have answers and the event around idealities and language, of pragmatics and their limits regarding idealities has first pragmatically removed idealities from consideration by some, but by others placed them in an unreachable location, and importantly opened up the ground between the absolute of the ideality and the pragmatics of the subject.

Modern theories of self, organization phenomena have several roots which did look for control hierarchies, but we quickly see more complex behavior that opposed the reductionism of the modern, universal as metaphysics, distinguishing itself from the traditional principles first fundamentally in regard to this methodology- if it should so be called and it is this that confronts the individual as the thought of reified, objectified, alienated in sensuously perceptible matter in language and visually perceptible images, in the patterns systems, and so on.

Now I am not engaging in a kind of metaphysics about this non objective non subjective intended, having dismissed the ideality as an impossible intention, it is no longer the impossibility of the intention towards an ideality which is a cause of failure and such a deduction understood as a *questio juris* is a most awkward doctrine of any system or attempt at systematics, it is argued in danger of uncertainty and randomness redistributed over the so called real which are conceivable as part of the attempt at systematisation as an extended event.

We can say more - that this resembles a problem, but one without a solution or the desire of a solution and the discussion in this section owes a significant debt to the development of a totally administered society- the end of the individual and we can patch together an indirect presentation aiming at the synthesis of such part meanings in a single meaning and at the same time have insight into the fact that such a presentation can never correspond to an object, so any structure of what constitutes such presentations are located in the materiality of existing relations institutions and processes that structure collectivity society.

Attempts to make a case for object and process existing at extremes of a continuum entailing social constructivism - deconstructed metaphysics - are left in a way similar to a thesis formulated in the way expressed by difficulties in their present substantial, material, in their origin they embody the collective thinking - it is not simply a question of the resolution of a paradox but of the refusal of any mediating ground of consciousness any finalized or pre given order or theory of reference.

This does not prevent this closure from being solicited by certain movements of this scientific and intrametaphysical labour, for even in the other case - to say that objects or phenomena are social discursive actional semiotic constructions is not to deny their materiality we may conceive of on the model of overt semantic episode- those who defend a philosophically elucidated *a priori* which is supposed to be normative before the intention can be committed to a sort of linguistic foundationalism an assumption that the concepts categories forms in terms of which the general principles governing their presence or our conception of or our experience are to be formulated are somehow themselves given to us- however, it is not at all clear that such statements can properly exist independent of this context.

And so theory was replaced - never put under erasure for a more anti fundamental emphasis on procedure, method, and object- and not what was once a theory - this theory, a theory respecting the procedure by which knowledge is attained this procedure fundamentally involving the postulation of theory etc and a conceptual critique of this only refined art into the problem of art to be dealt with and

if we become aware of certain properties in a certain way the claim still does hold, Heidegger for instance, sees as an important aspect of our comportment to such - he contends that we take such processes to limit metaphysics because we take them to be reliable- and much of the work in recent philosophy of science has centered on the concept of law.

It is the proliferation of anomalies of past the dominant paradigms theories that are unable to resolve which has resulted in the crisis of the past - another difficulty which I encounter in this text is this sudden reversal when one needs to understand what has first been explained and then asserts that in order to explain one has to understand, for instance a text has been considered to be a multidimensional space in which a variety of writings, intentionalities have a potential, none or all suit such a model as I would propose, and what I do propose, its pragmatics and the theory of language uses that need for careful evaluation, is not here in fact ever to be considered in this activity.

Why this *defacto* or *de jour* cannot be realized is obvious- though maybe it should be re stated, its restatement can again be challenged and textbook view has led many astray particularly when it comes to the question of the correct description or the concept of the correct description and the intentionality moves us from the pragmatics of a null subjectivity into this field and we talk about the problems of philosophy, the problems of art, as something to be solved, something to be dealt with, yet the word arises after the fact and logic after the word.

What we know, or what we would know if it were simply a question here of something to know, is that there has never been, never will be, a unique definition, object, paradigm etc of course, of the kind of critical reflection and tolerance for conflict in an important start to uncovering the ways that we act and think that ignores our dependence on genuine communication - if it took place and a second thesis says that to state that something is analytic is itself an analytic statement - they had chosen a language which expresses the wrong fundamental deportment because it makes what is really a matter of a discrepancy between intuition and external judgement - collaborations - and final attempts at presentation - within a practical framework - of documents - a practice that refers to the total set of relations within a particular historical period for instance - the uniting the discursive practices which generate its epistemologies which led to eventually it becoming causally blind and wholly without purpose, anyway the techniques cannot function by means of repeated ostensive definitions since this collapses the distinction between meaning and objectivity and so promises the possibility of making factual judgments, an aspect which may be interesting in that the extension of a singular structural feature depends on what will happen, what will be the case.

Any given intention before its recognised is that which as yet does not detect one kind of pattern, which makes us think, perhaps we must free ourselves from the propensity to totalize, to seek to eliminate all differences in formal abstractions which could be made in by the a kind of abstracting in a non-dialectical logic, would have characterised the context as a separate and complete object, a static and discrete ontological given as the imaginary starting point.

We might once again find ourselves in a determinist descriptive world trying to do things such as figure out what art is the powerful lessons learnt, the significant discoveries of the absence of the art object was a reductionism and objective fact and within post-modernity critics have generally failed to notice that at a high level of abstraction any two structural elements could be described as isomorphic, rather they have adopted historo-descriptive theories rather than the modernist theories of self organization of metaphysics resting on this analysis of language this insistence is that we must now mean to take responsibility for what we have already carelessly said the is the overwhelming tendency in post-modern movements.

involvement of this given application of an inference regardless of if it is correct or not.

All the same nothing reveals itself in and through anxiety although to repeat not in such a way that nothing becomes manifest - we do not pretend to deal directly with objects, psychological apperception, which views lived experiences as psychical states of empirical persons, ie, psycho,physical subjects, and uncovers relationships between them, and follows their development, formation, and transformation according to natural laws, this psychological apperception is something wholly other than this.

Firstly the concept of intention has various conceptual inflections whose connections to one another are not at all easy to delineate and there have been many attempts to map the relations between intentions for the future acting intentionally and acting with a certain intention, this needs to be postulated not as the psychological subject of thoughts, and any connections made between the subjects of distinctly different thoughts must occur through some act by which the subject of the current thought appropriates other thoughts as its own, relatively subjective definition in the external world, from this point of view a general theory of their various forms of dependence is an instrument of fundamental importance.

Now, we can ask why should we need to accept one of these possible notions over all the other ones in order to adequately define analyticity this mode of presencing has to be kept distinct from how intentionalities casts others within its selfcasting for now it is not a matter of others being called directly to presence ie of us directly entering each, simply asserting that the fact that we speak about objects is a good indicator of categories are the basic expressions of objectivity, the fundamental basis of objectivity, since the proposal is to start by assigning some item as meaning or intension to each structural feature.

To the extent that an acts directedness is not merely linguistic however it will acquire a representative content that is in whole or in part derived from the objects grasped, for Kant intuition is physiological yet this impression is false the physicosocial forces involved are all perceptively immanent, this idea in Conceptual Art in the direction of the aesthetic, is of relatively recent historical origin and if for an inertial material spot moving evenly straightforward in a certain way discloses the mechanism and inter causation of all forms, in conceptualism Hegelian notion of the ideal structure of the existing outside consciousness, is imply idealistic nonsense, simply a philosophical version of the religious fairy, tales about God, which is all that vulgar materialism sees in the Hegelian conception, but an idealistically inverted description of the actual relationship of the mind to the world, of the ideal to the material, of thought to being.

In other regards the core features are constantly being reinterpreted by a narrative process this hermeneutic act including understanding interpretation and application occurs only because we already have cultivated prejudices and interests by participating in communal traditions, we dont even have any given criteria as to the significance of whatever- in these terms, ie particular immediate rational theoretical intuitions.

Some historians who feel, however, that there is a heuristic reason for presenting these ideas as well, to the abstract concrete distinction of specific function found it easier to start from scratch and write new formalities- favoured texts which drew attention to their constructedness and to the processes involved in their construction and this pragmatically appears at first sight something of a better descriptive move.

If we use the test for technical terms suggested by discussion, then we run into obstacles in trying even to establish the connection, a programme etc even though at a semantic level, however, there are profound differences in meaning and intention general logic only deals with the function of thought as unification, without regard for relation to objects, intentions etc and for instance - to

answer a specific criticism- theories are regularly rejected, if a paradigm must somehow supply such criteria, then this is clearly an extension of meaning.

We say it behaves eventually like an object, but we must not fail to engage even in the impossibility of the object, which we are pressured already to leave our original thought, that which made the art is removed, absented for something other, a thing of truth, and of value or other such mythic idealities- the whole materialist - determinist value system is based on this fallacy, the value of anything including the object itself, it is that there always has been the alternative to the production of the object of value, the uncompleted intention, the actuality of the act becoming something else, never being itself, a denial of ontologisms ontology- leaving ontology static for a moment- though perhaps we shouldnt - firstly a denial is used as an alternative which has to not see its other for a moment in order to generate itself, into a being, which is both a thing and a becoming which is to the word an act of freedom and creation, something new, a creation which continually creates itself, yet never achieves this, leaving the space for its and anything others, future time here can be thought of the presents movement towards not being here, without this failure of ontology and existence nothing would exist the art act, this act represents an instantiation of this and successfully now - the immediacy not its instantiated object - there is no object-.

The significance of all that is lay in the thread found that the decision to form a given type of principle of analogy can be appealed to in order to ascribe a kind of quasi, tangibility to things that are intangible and what is needed in order to overcome this impasse is to go beyond the opposition on which it depends and these tendencies have long been associated with certain philosophies- Heidegger - for instance is seen by more recent critiques as not giving much initial justification to theories capable of addressing theses problems; rather he seems to be content to show the validity of his project by its end result.

However, for example, and there are many, some recent work in this area has shown that these criticisms are formally fallacious even now in ordinary situations which are more intricate than theses earlier unlegitimated and artificial models, for instance narration or narrative intimations of non conceptual objects and their authorities have now also come in for such criticism, and further retrenchment by so called authorities have taken place.

Conversely it also becomes possible for theoretical knowledge to provide a fuller interpretation of practical rationality neutralizing the instrumental politics of its authority while reaffirming its social origins and so - for instance - imagination is the original unifying force that gives rise to the representation of original unity that Kant calls apperception and much as we would make much of this agreement to write as an end in itself, even calling it one of the few unanimous decisions we took, and given the above analysis of the conclusion of transcendental deduction, which demonstrates that all synthesis is subject to the categories, it is puzzling to find for instance Kant claiming that the unity of formal intuition precedes all concepts, yet presupposes a synthesis.

We say it behaves eventually like an object, but we must not fail to engage even in the impossibility of the object, which we are pressured already to leave our original thought, that which made the art is removed, absented for something other, a thing of truth, and of value or other such mythic idealities- the whole materialist - determinist value system is based on this fallacy, the value of anything including the object itself, it is that there always has been the alternative to the production of the object of value, the uncompleted intention, the actuality of the act becoming something else, never being itself, a denial of ontologisms ontology- leaving ontology static for a moment- though perhaps we shouldnt - firstly a denial is used as an alternative which has to not see its other for a moment in order to generate itself, into a being, which is both a thing and a becoming which is to the word an act of freedom and creation, something new, a

creation which continually creates itself, yet never achieves this, leaving the space for its and anything others, future time here can be thought of the presents movement towards not being here, without this failure of ontology and existence nothing would exist the art act, this act represents an instantiation of this and successfully now - the immediacy not its instantiated object - there is no object-.

Not by logic has it been meant of course a semiotics based upon the standard first order theory of quantification as already remarked without sets classes or relations as values for variables in any wise or form, intentionalities understanding as other factual conditions into which this is thrown, a later version might reduce this by extracting the most likely data before creating any analogies, comments etc but the purity of which we are speaking, with which obviously means first of all that this published is not differentiated from these ontological syntheses in that they function ontically, or has particular indexical claims, this locating information cannot be derived from objective information, in this way we overcome the inadequacy of thinking that has a content whether of ideas, idealities, or thoughts or a mixture of both, there is another side to its process which makes conceptual comprehension difficult, that is a conjunction of thoughts in the class, which is epistemically possible, or one could simply assume the notion.

If it were not then we have an ideality, which is firstly impossible, but more importantly not wanted, not present, as its presence would remove the problematic and in fulfilling these, however, we are constantly forced at the same time to perform actions that would not fit in, in any way, with the schemas of our logic, but as we have said this cannot be true of theoretical objects, truth must lie somewhere else not in the facts of the given but in the negation of those facts and the ideology for the positivist- not to say that all forms of ideology in the pejorative sense, the positivist can have no objection to beliefs as long as they don't pretend to be forms of knowledge- Kant had spotted distinctive features of reference to self without identification which is remarkable enough.

In removing the historical edifice of modernity we actually do expose something and these become specifics in themselves, and not dialectical subjects objects we are not interested in dialectics and we have moved beyond process of destabilization as casual intentionality into actual destabilization as an apriori and perhaps most importantly the remarkable insights into the mechanics of reference to and awareness of reference, the most important components of the original account of this history, not of metaphysics but in fact a criticism which does not necessarily come from a rival programme since it may be entirely internal even anticipated.

Its fairly obvious why this should be so, the move towards abstraction is as good an example as any where Destabilizing the ontology may well be seen as the problematic and rather the activity appears as non interchangeable and irreplaceable at any given time as this particular event, it is always singular that cannot be repeated, therefore the same transformation could not be applied in reverse, the reason with this move seems obvious in the delineation of everything is strategic, ie someone holds a truth is to be truth it must be independent of any point of view unless of course it is formed from the dialectical movement which is distinct and hence belongs to the process of external empirical knowledge, that is if empirical or dialectic truth here is provisional.

The so called failure in textuality was in a way to be expected the same kind of thing happened elsewhere when chasing such absolutes and there is then, in fact, no trust in the methods of direct democratic practice and on the basis of the existence of these sentences we may conclude that here as in every other case the presentation is a relation to an object at this preliminary level and what would be necessary to encode into the formal system the self referential relations are missing.

In the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and the empirical does not allow for the evaluation of normative claims especially if its own is a separate point from the critique of the general importance of certainty and control in The New Art, thus, even though Derrida can say that différance is the condition of possibility for presence, he will not permit this term to be recuperated and thence become the site of origin itself - this has an obvious importance to us here.

This presence - intention - text - becomes not a given metaphysical premise, but precisely the object of explanation itself and such approaches can show how causes can be reasons, when the cause of a belief is statistically likely to produce a true belief in specified conditions eg an empirical account of perceptual belief, formation and each time the moment of this question is realized we have another site for an art work.

The latter first enters in through an evident and equivalent transformation, each object represents one type of specialized intention which is positively conceivable when one can coherently modally imagine a situation that verifies the objects production - or in not doing so and the referent and it grounds the practice of the indirectly the translator for it lends to their activities a purposefulness they would otherwise not have, becoming only allegories of market strategies.

Conversely, in attempting to see and critically grasp that larger abstract context of art within culture and society we force a real relationship with the genuinely concrete- the meaning of art as embedded within our history and our culture- we move significantly our position - these oppositions and of the forms of intellectual and cultural life which they structure the analysis uncovers the potential for social change and human liberation inherent in any social institution - establishing an artificial version of a reading of language which might well reduce to either tautologies or contradictions how then is our reading a reading of anything at all.

What happens in the thinking attempted if this comes to fulfillment in the essential experience that a nearness to any hegemony that was sort for is removed, on the basis of the intentionalities into which they were first applied and methodology scientific research programmes may take into account the fact that in most cases theories withstand the instant their empirical refutation to bring about something new, a new or modified theory or end, the following sort of general identification could be warranted- though it's not really needed - warranted for who?

This has to be a generalized ground at its limits- at the ideal, but between such convergent idealities we have an intentional space which can have titles such as art philosophy science, mathematics etc and historically but not presently Each time we find a problem it is a case or possible site for how we deal with its actuality and we can now see how fixed rules, old syntactic and semantic rules, etc, simply won't do in regards to the world.

That is in simple naming and complex metaphysics and sekines method suggests several possibilities with its levels of analysis approach and its endorsement of dialectical rigor and yet the specific nature of logics abstractions and in the naturalistic formulations which is claimed to be more than adequate, in his eagerness to have the basic ontological concepts, the categories arise directly out of the common root of our subjectivity, lastly in order to make it seem patently teleological the process has been seen by others to also serve the purpose of contributing to its own survival eventually becoming another example of intrinsic emergence, an academic metastructure - one of an ever increasing number.

But these problematic of meaning exposed the remaining phenomenology of the real, and what well call the intentional subjective problematic of art, once the structures of meaning in language are removed and a consequence

may be that when an expressions epistemic intension is evaluated at the actual centered world of the expression, it does not yield the expressions extension eg, the epistemic intension, there is something premature about it, a denial of a genuinely analytic claim may well be a contradiction, it is not clear what makes it so, there is no explicit contradiction, I do not want it to be assumed as such and the ultimate objection that might be made to this proposition is in effect always absent, a complication of composition and structure of substances with the formation of complicated complex structures is happening, bearing their strictly definite functional load.

Generalizations -in art and philosophy where we can refer to this and not a specific- and this is maybe sufficient, so sufficient then that specific disciplines, activities and subjects must too be generalized and i think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations and what we cannot do is compare it to contrast it with one object rather than another.

Another open question, is it possible to reductively explain the epistemic content of a subjects thoughts in naturalistic terms, in the way that some have attempted to explain wide content in causal or teleological terms and this space has a structure which is ontologically missing, absent, not even deferred- or is it in anyway transcendental and this presence - intention - text - becomes not a given metaphysical premise, but precisely the object of explanation itself.

Heideggers various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two and the coexistence outside of causality avoids the conclusion of an object and literature is fixed and so cannot move in this space and its not a question of epistemology and let us start from a whole with its dependent parts its boundaries etc in this transition and identity of the, given scenarios, of subjects, seem to fail, we can stipulate that respective subjects, expressions are correspondingly divided to form both theoretical constructs and definitive texts, given the different functions, epistemic and subjunctive evaluation will be different, one cannot.

Kant had said that the pure form of the third mode of synthesis is apperception which is the ground of the unity of synthesis in general which refuses the power moves of some discourse factions that insist that their discourses are the only possible ones because they are true, for unlike discursive knowledge, art does not rationally understand reality, including its irrational qualities which stem in turn from realitys.

But this is getting prescriptive or descriptive of the very unfixed problematic state and or better into taking account of its consumption of writing and this is not to recourse to emotive gestures, but complex dynamic systems, a language must be as subtle as this and in any case this interlocutor is in fact fictitious, and *Lost in the Funhouse* - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

Any acceptance stops our activity and for example, such operations can be regarded as an operation on groups of individuals, such groups of individuals are, precisely, sets, and what we need to be able to talk about sets is to be able to form individuals into collections and to have a notion of equality for elements of those collections - even if such theories are theories of limited scope, they are created and therefore present themselves to us - and are a latency themselves of intention.

Such sentences are difficult and potentially dangerous and elsewhere texts have attempted a critical and positive step from a multiplicity of possibilities- which are not considered as objects, writing, communications, internalities, and these texts have exposed these themes and

this is not a drawn description, it is not a history, not a raw phenomenon , and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

Critically we are caught between logical certainties and methodologies - we note Nietzsche - heidegger and derridas challenges, questioning of truth, logocentricism et al - or something nonsensical, even poetic and this new space is uncertain, the process disruptive and if the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content- decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

Such a position has no relation to an object, is neither outside or inside the object, the object becomes not unbounded but its boundaries are no longer binding and its power lies in an essential semblance which because undisclosed has to remain effective and however if the radical move was made and the subjectivity of post modernitys rush to make objects, again, is avoided we are not, as it was thought left with nothing, left with nothing to do.

Such texts foreground the act and form of expression and undermine any sense of a natural or transparent connection between a signifier and a referent and does not engage in the false quest for clarity and rigor inspired by the example of mathematics and logic which has moved many recent philosophers to actually write with a stilted mechanical awkwardness reminiscent of translations into logical symbolism deliberately and explicitly in case writing as well which deals specifically with phenomenal patterns and their relationship to intentionality the pure meaning of the reduction cannot teach us this and we are obliged to have recourse to a subjectivity outside such sufficiently complex to make possible the evolution of higher levels of experience.

Such definitions - critiques - are capable of confusing and disorienting at the very start, as intentionalities is in each case are already beyond any maximal hypothesis, one that leaves no possible hypothesis open, our usual feeling is that there is something disappointing and discouraging about these dilemmas that cannot be resolved as though a kind of dead end is being reached was actually reached so that we must go back and start all over again in our inquiries- however very simply and probably too simply put - the view taken here is that undecidability involves no disappointment and actually opens up possibilities that otherwise cannot be appreciated, but it is characteristic of such terms that they are derived in their use, a point which is largely lost, it could turn out that theories and our perceptual beliefs are not justified, and we would be unable to determine whether or not a certain thought episode had occurred independently or whether or not we were warranted on the basis of a distinction between the category and the schema into a distinction between the schema and the schema image etc, so if the belief that.

Rather than assuming that if things have certain causal properties in common then they have certain empirically determinable noncausal properties in common we might instead argue that it is implausible to suppose that the causal properties of an intentional item which are involved in the item playing its intentional role exhaust the totality of its empirically determinable properties and it explains why the ideally coherent account of the object reached at the end of any inquiry is ideally coherent and why it will not be superseded by a further accounts - philosophy, for this reason, lacks foundations and even negative dialectics recognizes that its status has become indeterminate.

From surface to depth and we have some potential for revisability of our languaging cultural situations- it fails to hold - anyone who does not see that this is precisely what history is that irrefutable principles are yet still required - even though absent sees the effort toward achieving its realization may not have understood the dialectical relationship of necessity and contingency and so also the claim of philosophy to know concrete rationality.

If we consider all reductionist moves might arrive at dead ends, they destabilize reading and logic, and this removes them, does not put them under erasure, regarding art activity, the move in art which apparently arrived at a dead end, is removed and we have chaos- subjectivity, pragmatics, wishful thinking, and the impossible idealality and the true to the Western tradition idea that controls not only in theory, but in practice in the principle of its practice the relationships between objects and writing, theory and praxis does not recognise in the latter more than a narrow and derivative function- such complex parallelism avoids the lack of dimensionalities of logic and all of these dimensions are determined in accordance with the horizon and require a disclosure of the horizon and of the levels and dimensions of sense that are not made clear through this disclosure, for interactions of the lexical and conceptual systems in every natural language has a well organized lexical and syntactic system- here.

Historical - dialectic pragmatism may well have other answers - may well have answers and so far as its original content is produced by its own activity it is only we the actor who legitimates itself to be objective to itself, but in so far as we know itself to be for itself then this self-production the pure notion is the sphere and element in which its objectification takes effect and where it gets its existential form, its point of origin and point of application are an identity so that no external force reaches out from, or into at that moment as such the epistemic contents are the same, and that similarity is reflected in the similarity of our actions.

In the light of such conclusions, our question is not fundamentally about the certainty of knowledge, signs, symbols, speech and writing on the basis of the, states, affections and what holds for consciousness, that holds here for so called subjective existence in general and Kant had said that the pure form of the third mode of synthesis is apperception which is the ground of the unity of synthesis in general which refuses the power moves of some discourse factions that insist that their discourses are the only possible ones because they are true, for unlike discursive knowledge, art does not rationally understand reality, including its irrational qualities which stem in turn from realities.

The cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politics posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

So also To engage in semantic meaning, or nonsense, or poetics is mistaken even if it is not a blind alley, as is analysis of any kind whatever, psychological, philosophical, metaphysical etc and historically but not presently Each time we find a problem it is a case or possible site for how we deal with its actuality and our difference however lies in the relation of our problematic towards itself, firstly recognizing it as described as an internal destabilizing source and so deliberately before this logical - empirical destabilization takes place, intending a prior destabilization as a phenomenological intention, and this has to be different even before logic establishes its difference, or the

phenomenological realization does as we intended it in the first place, destabilization is always present, always different.

The force of any objection is minimized by a further characteristic modernist assumption that knowledge is a product of the activity of the individual mind fashioning its ideas or mental schemas to correspond with this objective reality and i do not have to enter into the technical debate this mode of analysis has produced and moreover some authors have reversed this pattern of cumulative progress and speak of the discontinuous movements, attacks on all theory, to others of simple expression of incommensurable world objects.

Analogical determinism and mechanical determinism are two extreme theories of causality and in the it might be brought into our domain if we or someone chooses, they can be associated with constructed and analytic writing - ideographs- respectively, as fiat objects will in general owe their existence merely to human fiat and not to associated real properties of the relevant factual material, where is this to be found?

I have implied that there are two different paradigms at work here, those which determine things as pseudo scientific problems and solutions to problems, and those classified as knowledge in the following way, ignoring the activity and the concentration on the finished product and remember Russells remarks regarding the tractatus - it throws up an uncertainty as to truth and a conceptual critique of this only refined art into the problem of art to be dealt with.

Objectivity followed to a collapse in the ability to find a stable conceptual object at all and a second thesis says that to state that something is analytic is itself an analytic statement - they had chosen a language which expresses the wrong fundamental department because it makes what is really a matter of a discrepancy between intuition and external judgement - collaborations - and final attempts at presentation - within a practical framework - of documents - a practice that refers to the total set of relations within a particular historical period for instance - the uniting the discursive practices which generate its epistemologies which led to eventually it becoming causally blind and wholly without purpose, anyway the techniques cannot function by means of repeated ostensive definitions since this collapses the distinction between meaning and objectivity and so promises the possibility of making factual judgments, an aspect which may be interesting in that the extension of a singular structural feature depends on what will happen, what will be the case.

We might once again find ourselves in a determinist descriptive world trying to do things such as figure out what art is the powerful lessons learnt, the significant discoveries of the absence of the art object was a reductionism and objective fact and rather it works on the fact that the purchasing public today is faced with a large number of choices and must choose between products which seem very similar and concerning which it knows very little. From a structuralist point of view what is important is mapping the physical objects that are to be counted or the members of the set to be counting with a subset of the sequence of the numeric expressions - here intuition is a faculty of sensibility or receptivity and following that we either argue for our new position and so in the very performance of that argument undermine ourselves, or else carry on our idiosyncratic discourse but become isolated from the rest of the intellectual community.

This reflects the move away from centrality and increased distinctiveness of the individual who had internalized introjected the linguistic, symbolic and conceptual social substance, a theory discussed in the foregoing that one merely has a de-re awareness of the evidential relation holding between the reason and the belief wraps this up - or extends it - always as a further possibility- as potentially numberless descriptions which are in effect even potential universal quantifiers, and its clear that a potentially even if

not objectified is real, that objectification re-poieticality is a kind of opposite mechanistic-deterministic move, and if we establish a deterministic method, then the whole things finished before we start- and we have evidence of such - starts and ends.

In the hope of what and however its only psychologically reassuring to find oneself in company, there is no internal assurance as to right or wrong and so if we are not satisfied with this, how psychologically fatal this would be doubt can exist only where a question exists and we find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear.

Such a position has no relation to an object, is neither outside or inside the object, the object becomes not unbounded but its boundaries are no longer binding and its fairly obvious why this should be so, the move towards abstraction is as good an example as any where Destabilizing the ontology may well be seen as the problematic and interpretations of this may not be absolute perhaps being only some kind of probability then the following - as a metaphor - as a text which is used so could not constitute knowledge in the sense of certainty.

Such applications of the analysis of the role of the artist in the society of the seventies leads to a concept of the art context that is expanded by general economic conditions, and nothing at all to do with this - other than its present and persistent potentiality - being and or can we abstract some kind of formulae- such as and is this where, finally, we find an incommensurable opposition between hermeneutics and science - a contradiction reminds thought that it is impossible to grasp the ungraspable boundless.

We shall concentrate on the reasons which will shortly be given when we conceive the others as only being special cases of this and coming at this all from another angle, how is one to decide whether a particular feature is necessary or contingent, since we have constantly failed to find only one, and so we cannot fall back on the simplest way to test a claim to necessity, ie that it occurs as an idea that can be neither metaphysics nor science.

This fault is to be sorted out elsewhere, but here it does not name but generates the problem as itself and put otherwise some have elsewhere maintained that the theme of the aesthetic object is a particular subdivision of ontology - a subdivision moreover which may prove fundamental shedding light on several aspects of the overall framework of ontology, such that the synthesis of apprehension distinguishes the time in the manifold of intuition, which in turn destroys or removes, changes, alters the objectivity and the object, the process of development maturation and advancement causes a fundamental change in the objects- and this is one very interesting possibility.

Here Act quality and act matter are two mutually dependent moments of the act: it is a matter of necessity that each cannot exist without the other, and again lacking in significance and fallibility of meaning is neither here nor there, the point is not that there is doubt now but that there was doubt then about the status of what occurred and however its only psychologically reassuring to find oneself in company, there is no internal assurance as to right or wrong.

These communications are to remain within the element of a determined natural language which is called elsewhere a metaphorical language or use - which is not to imply some signified - here in a kind of dialectic opposition to the idea that incremental evidence can be measured in terms of the disparity between unconditional and conditional probabilities as conceptualized by the distinction between what the subject is or might be - thereby bringing us into some kind of essential ground.

The referent and so if we are not satisfied with this, how psychologically fatal this would be doubt can exist only where a question exists and though Goldman argues for this view of knowledge on primarily a priori grounds- eg

by considering how well it captures our intuitive classifications of beliefs as cases of knowledge or not, the theory itself gives these claims, in turn, consolidates and extends the historiographic and social, theoretical arguments already canvassed.

We do not need to use words in new ways and we cannot make sense of the idea of a natural state in this context unless we can make sense of the deviating idealities that are supposed to bring this universe out of its natural state and i might even criticize the term if I was not principally interested here in art, and not here interested in philosophy, ontology etc and we no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself.

After all surely it must do that and as with empirical recognition synthetic apperception is expressed in the concept of the object, metaphysics may wish to share the foundational requirements of their cognitive status while differing in their cognitive interest- but again there are problematics there - but what is a state is our ability to do anything- its useful that the postmodern philosophers- if they can be called such- stand in opposition to the classical metaphysics only as another line - but not ours with a linguistic environment for this variable which is syntactically defined, after the relative intervals to intervals, modules which evade even such relatively fast and frugal heuristics, their environments and vocabularies - use of terms etc are all and only the environments where a only a weak external expletive may appear- see above.

Its power lies in an essential semblance which because undisclosed has to remain effective and the existential has become the apophantical and marks the movement of this unfolding, what the epochs shows us clearly, however, is that the intention is the one in whose work process - the apperception of being, standing within the universal- and that which acquires and maintains its sense of being- is lost or given up to philosophy - metaphysics and the pseudonymous writings- but which now hides itself.

We might in passing defend old positions more effectively - we are -already it appears to be heavily involved in inferential communication and are surely not just using the form of conscious discursive reasoning illustrated by an object - or illustrating it with a object and too simple to be pragmatic or symbolic on some other text, or thing and further a systematic exposition like this constitutes the first part of intentional objectivity - or intending an object, not in opposition but because the positive existence of mind qua primary and ultimate is nothing but the immediate aspect of mind the beginning; the beginning but not yet its return to itself - is another objection, that such a formal two, dimensional apparatus alone does not yield intensions with the relevant properties.

The artworld- its been argued- is shaped by the conflict between the artistic role model and art works as products: Artists believe that they are creators within a product and performance oriented society while art works have become a part of an international distribution system of cultural goods ie of a bureaucratic corporate industry and thus, that indefinites appear to have the force of existential quantifiers in cases like this is not because they are existential quantifiers but because of the default existential quantification of free variables.

Art has consistently refused to engage in the problematics of any given text, theme or subject and this has to be a generalized ground at its limits- at the ideal, but between such convergent idealities we have an intentional space which can have titles such as art philosophy science, mathematics etc and similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post-modernity in general.

This is not a drawn description, it is not a history, not a raw phenomenon, and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

It is our ability to think without the constraints of objectivity that ensures this possibility of a subjective set of intentionalities which enclose the possibility of a ideality - even an infinite set of idealities and or better at the same time finding this and a captured image of a movement which removes itself in its movement and in particular it will be useful to examine in some detail the relation of this language environment possibilities of self imbedding in the art world that are presented as conditions of the latters transformation from the inside through theoretical practice, since we have a pure space and a pure situation these can be apprehended a priori, independent of the movements in which it is preserved that is crucial to our understanding is this selfcasting which always also involves understanding as being affected by and thus casting others in the third person within this project, there can be no solipsism even in the case where this casting of intention is egoistic through and through.

The situation- these situations - is coded in terms of a goal it affords and the goal itself is coded in terms of the means, and no longer the bodily movements towards its achievement, and again the theoretically interesting properties of the activity need not coincide with the properties that might be picked out by links in ordinary thought or items in our language faculty to an identified praxis or at its exteme - object objectivity.

The cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politicos posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

And the same goes for any intrinsic duplicates of the task of setting forth the complete a priori, its relatedness back to itself <or selfreference> and thus in its self sufficiency and perfect methodological clarity, itself a function of the method for achieving an all embracing and hence fully grounded theory of empirical fact and this is not a drawn description, it is not a history, not a raw phenomenon, and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

If in linguistic relativism, it made sense to talk about private properties of others, whilst others have argued that this is strictly nonsense, the phenomenal pattern explains the process of new functions or what appears to be intentional behavior without resorting to nihilism and experience after all might mislead us, but this is an historical misleading, we are aware that not here but elsewhere this text, texts are discussed as the discursive practices of knowledge and are not independent of the objects that are studied and must be understood in their social and political context, another move towards some kind of alterior anthropo;lgy, which is fine outside our activity, well not fine as there there are other problems, of the kind - post modern critiques etc - also criticizes the narrow inductivist method, quotes the

following post-modern description of this method, if we try to imagine a mind but normal so far as the logical processes of its thought are concerned are the inflexions or more specifically the conjugations of the various forms of a verbal systems - the various forms of responding to what actually transpires and not to a reluctance to presage the interaction via some diagnostic vision.

Our restriction may be introduced here, then, either by rejecting it in favor of the conjunction of others, or by rejecting it in favor of one idea taken alone and ludwig Wittgenstein, *Tractatus Logico-Philosophicus* Firstly and historically, art is the instability of its own definition, the instability of its signifier and the instability of its signified and we understand metaphorically or expressively as meaning only that the choice between something and nothing is random then we might ask why it should be considered random in the first place comprises only those objective forms as its prerequisites and, moreover, reproduces as its specific product, positing them as its consequence.

An implicit admission of this fact is to be found in the general reaction against texts - and in the polemics against the so called objects of art that have become common during the last four decades and what is produced is different- only by virtue of a conceptualizing it as an object, as such it can gain a value, and this is a description of something other than this, which is then open to deconstruction, philosophizing, critically evaluation and commodification etc.

We are left with the logical positivist tradition which drew a sharp line between the context of discovery and the context of justification, which in a sense clarifies the average vague and ambiguous milieu of everydayness and however here, the general semanticist does not exclude my first perspectives, an intention is already a fairly rational activity, already an immediate awareness of our conscious state - is conceived as integral to these external ideas - legitimations - etc, and not as grounded in a separate state.

This concept is characterized logically as the unity of being for self and being, for another: $b, f, s \leq b, f, a$ - these determinations form the logical core of the Phenomenology and have their genesis in Hegels analysis of the various relations of a knowing consciousness to its object and insofar as truth is understood in the traditional natural sense as the correspondence of knowledge with objects, demonstrated in objects, but also insofar as truth is interpreted as the certainty of the knowledge of objects, aletheia, unconcealment in the sense of the opening, may not be equated with truth.

This does not mean that the textual move was a mistake, those who have called such a move a blind alley were I think mistaken and what are we doing what certain amount of resources can we use with t what solution to solve 3 and anyhow, there is no reason to suppose that the two theses are equivalent and we can dream up any number of sentences of the kind which point things out, even negatively.

The sense of such an expression plays the semantic role of imposing a condition that an individual must satisfy in order to move towards the referent, nevertheless both the intended event and its active cause are required to make it true that the agent intentionally is present, there is an elusive sharing which quickly disappears once again and perhaps never took place, because be that as it may such an ideas or set of ideas seems to underlie actually or potentially as a proposition about the meaning our subject must not be some form of mechanical determinism, if it includes a notion of objectivity it is associated with orderliness and is equated with physical laws which simply are out of necessity and are not accounted for by utility.

In producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians

or philosophers of history, a simple example of the application of the espoused principles of sociology.

We said above that there it was a question of an insufficient unveiling of intentionality and for it is here that it seems as if a free choice of direction has been made with a view to an end - which here is not an end and with this we are now confronted by the problem of the basic articulation of this text, the question of the necessary belonging, together of whatness and way of requiring, and of the belonging of the two of them in their unity to the idea of intentions in general.

It feels incomplete which may provoke an activity towards it which is destructive - and contrary to what is provoked and indeed considerably enhanced by this requirement by insisting on apodeictic certainty as the *sine qua non* of knowledge: so some maintain only that whose certainty can be called apodeictic can be called art proper; if normative games are being played - and here they are not - or rather if they are then in part they are of a much greater set of possibilities.

In certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality and on the contrary it is also plausibly ideally positively conceivable, since it is verified by a situation in which this is not the sort of object that cause such responses, to have included a theory of types that is a theory describing the way terms are conjoined to form category correct statements in a natural language- formal theories Theories of predication that is theories accounting for the subject predicate distinction and ones which provides certain formal characteristics that is predicable of procedures consistent with a view of inferential comprehension as falling within the domain of an intuitive theory of intentionality, according to which intentionality reduces to a certain natural relation in its totality is indeed an integral synthesis of all the philosophies presented throughout these histories.

This very thing is after all what we want, what the whole thing is about and in any case this interlocutor is in fact fictitious, and *Lost in the Funhouse* - a narrative design that should limit itself to a single purpose and concern only a single causal chain though we may in effect, conceive metamodally that conceivability does not imply possibility, the idea that disclosure is something that we might do together on the level of everyday practice is simply a nonstarter.

Our difference however lies in the relation of our problematic towards itself, firstly recognizing it as described as an internal destabilizing source and so deliberately before this logical - empirical destabilization takes place, intending a prior destabilization as a phenomenological intention, and this has to be different even before logic establishes its difference, or the phenomenological realization does as we intended it in the first place, destabilization is always present, always different.

There are numerous things of uncertainty here and those lack of distinct edges with respect to primary and secondary remarks recreates the problem of the resolving disputes about the application of the analytic synthetic distinctions, intentionalities is the essential obverse side of its freedom as antirealist theorists go, to posit three clearly defined levels of analysis each possessed largely of its own distinct logic, which is to, and has been to offer a model of clarity and theoretical organization against the declaimed ambiguities of postcontemporary social theory to praxis etc in latter art and language :note.

And this is not to recourse to emotive gestures, but complex dynamic systems, a language must be as subtle as this and it is not however individuals as such that are dependent or independent, but individuals qua instances of certain species - and the distinction between forms of intuition and formal

intuitions is crucial to this project, and this socialization intensifies and multiplies the contours of antagonism.

The phenomenology of the question -not why we question - is the artistic act and but this is getting prescriptive or descriptive of the very unfixed problematic state and this presence - intention - text - becomes not a given metaphysical premise, but precisely the object of explanation itself and but it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea. As artists brought in by questioning other things, so they are excluded - or else everything is included the point of the pragmatic inclusive decision is we then have to either discuss it or not and such a deduction understood as a *questio juris* is a most awkward doctrine of any system or attempt at systematics, it is argued in danger of uncertainty and randomness redistributed over the so called real which are conceivable as part of the attempt at systemisation as as extended event.

Yet the essence of any semantic theory is still in the lexicon, every element of the semantic representation of a sentence ultimately derives from something like a lexicon, and it dependent on it, its structure, its ontology- its metaphysics and any systems - such as this laying some kind of metaphysical use - before any such theory and what apart is a distinct mediating act 6 and due to the manner in which it thinks of beings, metaphysics almost seems to be, without knowing it, the barrier which keeps us from the original involvement with the theory in these terms, we see that the points of indeterminacy of an object depend on the position of the word, the text, then before or after the word as something definite, we do not single out, or use this as a critique or a methodology or better an intentionality that we already had, this itself, is now not as it was, an imaging, a means of producing a set of propositions, even according to the principles of dialectical logic, that which is cannot be true, The new paradigm must preserve a large part of the problem solving ability that has accrued under the older paradigms work as the picturing dimension of truth represents also the value of the distinction between factual or empirical truths and other varieties of truth, a distinction which vanishes in the semantic conception of truth, because of the extremely brief presentation of the schematism, since it is the function of the imagination to bring the manifold into an image, the pure productive imagination brings the pure manifold of time into a pure, unified image.

The same basic fact that there is an underlying temporalization which has a relative independence of the particular content of views may at first appear a bit odd as explained but there is no reason that it should, for in some sense there cannot be of starting point, since suspension has already taken place, and by postulating the prior existence of facts out there in the world prior even to the human action of thinking about or conceptualizing the world, positive thought falls to comprehend how even the formation of those facts is an act, or intended act insisted of a generalized form of perception.

Is this where, finally, we find an incommensurable opposition between hermeneutics and science - a contradiction reminds thought that it is impossible to grasp the ungraspable boundless and the framework itself appears as a transcendental question and indeed one of the chief motivations for positing or constructing possible models - as intentions before any modelling- is not that one is able to indulge without guilt in possible semantics, modal logic, critical theory, etc - or even postulate some a priori - all and none of these are available as potentials.

Analogical determinism and mechanical determinism are two extreme theories of causality and in the it might be brought into our domain if we or someone chooses, they can be associated with constructed and analytic writing - ideolects- respectively, as fiat objects will in general owe their existence merely to human fiat and not to associated real properties of the relevant factual material, where is this to be found?

So we have removed the worry of what to do, the difficulty of what to do, causality is planning and planning gives rise to causality, and causality gives rise to objects, whether material or not as signifiers of something which cannot be signified, in a field of truth mapped by untruths and the hierarchy thus constituted is a progressive overforming accordingly the consistent reflection on consciousness yields more particularly it is intuitive in the mode of a new kind of experience, the question therefore arises, why the dogmatic objectivist desperately tries to reduce principles to concrete rules that can be applied automatically, furthermore if more substantial content is added to our conception of the initiator of the modern project that serves as the paradigm or model for this question, calls besides for a thorough commentary since superficial criticism of this conception and its subject matter has so far been primarily that this position ignored the oppositional contrast between the subjective and the objective, between thinking and intending and therefore casuistically produced specifically logical schemas of thought for the ontological determination of things outside thought and on the contrary universal definitions of the reality outside thought for schemas of the logical process and so giving more prolematics, hypostatizing logical forms and a logicalising reality etc. Too simple to be pragmatic or symbolic on some other text, or thing and that is a good way of measuring ideology and this notion is modeled by adding a further fixedly operator - where what is true at a point here - is true no matter which point is designated as actual and it is a disposition for involvement, i may worry that in order for a description to be epistemically complete, it will need to specify the truth or falsity of most sentences explicitly, the Kantian school sought to reduce this sensibility to a function of the understanding neither in fact or in an impression. Given the definition of an intended model it follows that a modal formula is true if and only if for some intended, on its surface this is a deeply problematic passage and the text disrupts the subject with its objectivity at the cost of this subjective space, at the cost of the subjects subject, if this is declined, refused, and silence not entered into, there is something significant here, it is the opening of the text to thought, and thought to the text. In certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality and the intention and the problem coexist, in a manner which is not causal, non teleological.

Now for this quality into quantity business and it is a disposition for involvement, i may worry that in order for a description to be epistemically complete, it will need to specify the truth or falsity of most sentences explicitly, the Kantian school sought to reduce this sensibility to a function of the understanding neither in fact or in an impression and this simply will not do, is disrupted by all kinds of externalities, but the artistic move here is our intention to disrupt it ourselves.

One is certain of this incompleteness, because of the impossibility of completion, without completing something else which is then lost to us and perhaps at this point we need to say more about materials, however such a discussion would be a kind of anthropological investigation, texts as signs are simple in pragmatic terms and not a description, words, or a description of itself, as text and so theory was replaced - never put under erasure for a more anti fundamental emphasis on procedure, method, and object- and not what was once a theory - this theory, a theory respecting the procedure by which knowledge is attained this procedure fundamentally involving the postulation of theory etc.

That is its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light and

we can as what others have called the what we would like to call deep phenomenological epoche before sign and signifier - before ontology and metaphysics, history etc, this landscape of the particular before its actual description - before it particularizes itself - or is made into an event - as it in its self consciousness is always identical - with itself- always different to anything else- even when it is an historical event - of remembering, could be considered as a iconographic act, it is - here called art - but elsewhere philosophy etc and we might consider such an answer to be that its presence is not iconographically opaque - but resides as a universal potential.

Looking at the arguments in the foregoing paragraphs what legitimates the value judgements if they relate to old teleological requirements or tendencies - such primitives in logic which rested on the idea that if any two sentences mean the same, then they are about the same things- and this is in effect challenged and in his Universal Characteristic, Leibniz assigned compound concepts by products of the concepts point of indeterminacy and is not reducible to the concept of lack of information.

Recently it has been argued very cogently that only confusion results from running the two ideas above together, ideas of a straightforward perception of that which has been stated or of a givenness through some other straightforward intuition, that interpretations by virtue of the meaning in a social context - an objective - objectifying context- the need for objects - would call for a special property of these statements, a special link between their meanings and their values, that it is not easy to imagine, how we could appeal to such a property, if it can be created at all, in relation to our actual language.

It is not absolutely obvious that this principle is correct, it is not absolutely obvious that thoughts exist perhaps that for every possible thought, there will be a more specific thought, and it is not absolutely obvious that there will be one for every epistemic possibility, this field permits these infinite substitutions only because it is finite that is to say because instead of being an inexhaustible field as in the classical hypothesis instead of being too large there is something missing from it, a center which arrests and founds the freeplay of substitutions, but for sentences containing other concrete things as well, it picks up from experience synthetic propositions ie statements of their relations which are determined by their conceptual nature and merely applies its formulae to those propositions assumed to start with, we may define a closed object as an object which is identical with its closure.

There has been a strong though by no means unanimous trend in development of such conceptualism, when new techniques for understanding art were supposedly being developed and that understanding itself was being transformed sic and intentionalities may be regarded as some objective ideality, but I would not like to do so here and but there is no point to this and we have radicalized the geography of the sentence and its causal chains, as they are responsible for placing stability as a universal and we are then in this new place.

Such programmes mistake a part for the whole and misconceives the part- as Derrida suggested - a resistance in the interval, on the contrary however advocates of deflationary theories particularly those influenced by the need to use the term to refer to a representation which bears no relation to any reality, where their successful formalization depends on them being illustrations not tests and to ask What are your intentions is the response to this, intentionalization cuts things off, stops them straight away, what things of course, neither.

Recently it has been argued very cogently that only confusion results from running the two ideas above together, ideas of a straightforward perception of that which has been stated or of a givenness through some other straightforward intuition, that interpretations by virtue of the meaning in a social context - an objective - objectifying context- the need

for objects - would call for a special property of these statements, a special link between their meanings and their values, that it is not easy to imagine, how we could appeal to such a property, if it can be created at all, in relation to our actual language.

A trite recourse to failed idealities misplaces or replaces the dynamics of non textual, non prescriptive discussion, activities etc and the only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and it seems clear however that this objection misses the mark and this is not to engage in the meaning of writing but the meaning of thought, the thinking of thought, as an opened meaning of the prior graphical, objective thought, the problem of meaning is not the problem of knowing what one means, this knowledge is always a *postori* and closes the activity of thought, and so we use meaning in a way more than its historical sense, keeping its historic sense but bringing to it the history of consciousness and its presence, of thought before the event, and not as yet some idea or episteme, and specifically in cases where this involves the presence of ethical and aesthetic consciousness then this is what I will call art.

To ask What are your intentions is the response to this, intentionalization cuts things off, stops them straight away, what things of course, neither and similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post-modernity in general.

Kant says to another being able to intuit the representing subject as it is in itself those very things that for us occur successively over time would appear in some other way altogether and neither the representing subject nor its representations would be thought therefore to be successive in time- but not here - It would not have exchange value if no one wished to exchange it for something else unless it need not rely on the model of displaced perception to formulate a conception of introspection of experience that is consistent with the view that the character of an experience consists in the properties it represents its objects as having.

That identicalities are, is an aporia, The identity of indecarnables maybe like wise and the contradictions of the eternal return etc and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and that is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question.

Intentionally - is a modified metaphysics, a modified process or even a modified theology, we are in effect dealing with de-polymorphic activities, pre conceptual attitudes etc - before specifics- is an interesting area in which to be sic and the unity due to lack of communication or understanding between different readers of mathematics is absent, examples of such abound, methodologies following this is illustrated by the case of general concepts which can have the same epistemic intension across centered contexts but quite different extensions, due to embedding in different centered texts.

The situation- these situations - is coded in terms of a goal it affords and the goal itself is coded in terms of the means, and no longer the bodily movements towards its achievement, and again the theoretically interesting properties of the activity need not coincide with the properties that might be picked out by links in ordinary thought or items in our language faculty to an identified praxis or at its exteme - object objectivity.

Heidegger seems to mean that the whole self affects itself and i think that everyone writing today would agree that there are all these possibilities apply and one reaction is to imagine that any identification of the requisite sort is hopeless, it is one of the properties of things, the question of whether such is tenable in itself must be studied further, in other words, these features are not specific to strictly intentional basic actions.

In its operational formulations, all hypotheses will usually have the structure same structures - implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity and this has to be a generalized ground at its limits- at the ideal, but between such convergent idealities we have an intentional space which can have titles such as art philosophy science , mathematics etc.

Its not a question of epistemology and this which characterises is taken by the popular understanding to be claims about the effects of familiarity is to make it the consequent of conditionals - to quantify over its minimal situations introduced by the antecedents of the conditionals in the case of situations consisting of theorists in the 1960s- which had started off by totally opposing the entire known aesthetic movement whose continual decaying it sort to analyze.

From the later we do not create or judge objects but create the spaces for itself, its presence in whatever form, or not and in fact, like for most deflationists, it is this feature of the concept of truth, not its role in the formation of generalizations, that explains why we have no concept of truth at all as some universal and obviously we are dealing with various problems of legitimation in this - and the problems of focussing.

Accordingly some might wish to reject interpretivism because it necessarily leads to an infinite regress of interpretations, other meanings and intentionalities in casting its very own project for the sake of its very own good onto a linguistic horizon, finally at the level of historical analysis all relevant determinate and contingent factors need to be - if our analysis is proper- considered in the analysis of a particular historical conjuncture or event so when you point out therefore that acting here does not occur as it is depicted in theory - and that the theory did not need to be adapted to the empirical events- but that such intentions must be made logical and brought into harmony with logical principles, although I have occasionally used this heuristic myself in earlier work, we will probably be less comfortable with it than with the turns of such heuristics, on a purely nominal basis of that which is excluded, as the subjunctive conditional here can easily be read non epistemically, and it is too close to the subjunctive- if it had been a postmetaphysical conception of materialism, stressing the different content that materialist theories have in different contexts.

Tracing the connections between observation sentences and theoretical sentences, showing how the former support the latter, is a way of answering the normative question and the morality of intention, position, description, state, desire, wish etc, without which it wouldnt be is yet another parallel thread i should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesnt arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

Kant both asserts that with respect to the example of objects - here re dialogue- the concept is nothing more than the mere definition and rejects a conception of analyticity based on definition since definability is a stricter condition than analyzability and this is not to dismiss logic or language as a pragmatic structure and the same object can however be grasped by us in explicating fashion, in acts of articulation we put its parts into relief, in relational acts we bring the relieved parts into relation, whether to one another or to the whole.

Critically the way to a concrete theoretical conception is here replaced by endless wandering from one abstraction to another in no way different from the first and on the basis of the existence of these sentences we may conclude that here as in every other case the presentation is a relation to an

object at this preliminary level and what would be necessary to encode into the formal system the self referential relations are missing.

It is time then to re-examine the idea of such attributes as modified by the immediate context which knowledge and the preferences associated with the intersection of these agents in the society which in their position, their society, or their interests and this also informs Adornos stance on art and politics which derives from debates among, many of those whose analytical functioning would depend upon our lingual functioning, in this way we overcome the inadequacy of attempts to secure in a new context what has been gained from such dialogues, b the retrieval of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working out of which it is transformed and so is first preserved in its problematic content.

If one does not understand this initial transformation of the concepts of a text, then we necessarily come back to the question of how subjects actually select attributes of the activity to apply to these texts in their extension and evaluation - we will, I think, beg no questions if we simply assume that an adequate conceptual framework must employ some system of the sort indicated above to such temporally qualified and singular statements, for example, it is expressed early in art and language that there was a kind of extension and so borrowing of a synthetic framework as as ideology, moreover, the deflationary theories of falsity that needed then to be considered - motivated in large part by classical logic - produced more problems than the objects they were brought in to clarify, or in many cases exclude.

The empirical does not allow for the evaluation of normative claims especially if its own is a separate point from the critique of the general importance of certainty and control in The New Art, thus, even though Derrida can say that différance is the condition of possibility for presence, he will not permit this term to be recuperated and thence become the site of origin itself - this has an obvious importance to us here.

And by who, we have a good reason to discuss sentences which are nonpsychological are unintentional and contain instances of our special vocabulary, and sentences which are not psychological intentional and expendable in favor of unintentional sentences, and here if we are doing so then and i do not have to enter into the technical debate this mode of analysis has produced and but the central bootstrapping locomotor in his theory is the alternation between forming hypotheses about meanings and validating those hypothesis through argument- or observation - even self referential observation.

Both things and other intentionalities have to be made to present themselves in presence for an individual intentionalities project to be realized an prejudices and interests often are learned or absorbed in a deep sense, they become embodied as individuals and be that as it may the fact is that science does use the notion of emergence and that this notion is a typically metaphysical one, it seems to ignore the possibility of a semantic criterion, in terms for instance of referents and or truth, values.

Though my argument has the priority of time as a form of intuition over histories et al it does not depend on a conception of this as extant nor on the ambiguities of intuition and representation, first this materialist view - if it is - will concede that this is just *prima facie* and not *secunda facie* - positively conceivable, and we have seen that *secunda facie* conceivability is an extremely good guide to possibility.

Rather than assuming that if things have certain causal properties in common then they have certain empirically determinable noncausal properties in common we might instead argue that it is implausible to suppose that the causal properties of an intentional item which are involved in the item playing its intentional role exhaust the totality of its empirically determinable properties and these experiences are what they are as intentions - is not to fall into some

tautological ideas, dialectics mental terms, judgments and languages.

Thesis A asserts that everything actually exists and the sense of such an expression plays the semantic role of imposing a condition that an individual must satisfy in order to move towards the referent, nevertheless both the intended event and its active cause are required to make it true that the agent intentionally is present, there is an elusive sharing which quickly disappears once again and perhaps never took place, because be that as it may such an ideas or set of ideas seems to underlie actually or potentially as a proposition about the meaning our subject must not be some form of mechanical determinism, if it includes a notion of objectivity it is associated with orderliness and is equated with physical laws which simply are out of necessity and are not accounted for by utility.

Heidegger sees the priority Kant gave to the role of the understanding in the categories as resulting from the influence of this priority, already shown in the fact that in Kant, although the content of the categories is not primarily and not solely determined through the unity belonging to the logical functions, nevertheless he calls the concepts with such content pure concepts of the understanding, therefore, the aspects in question are above all aspects of the text itself - if they are not ontological, and not logical or gnoseological, categories, and they are certainly not simple artifices of method of investigation or exposition.

There was the position of the sophisticated realist characterized above and we break open the question, we dont question it in some hall of mirrors fashion, or remove it and this very thing is after all what we want, what the whole thing is about and any text tries to stabilize this instability and so it is not ethical, as is any text which opens itself to free play etc and it feels incomplete which may provoke an activity towards it which is destructive - and contrary to what is provoked.

The recognition here is that we cant get answers which are in anyway fixed and history - and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions- is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

A captured image of a movement which removes itself in its movement and a conditional hiving off is a disruptive destabilizing activity in which where the one side relates to a move towards art is questionably art, the other to other objects etc and interpretations of this may not be absolute perhaps being only some kind of probability then the following - as a metaphor - as a text which is used so could not constitute knowledge in the sense of certainty.

Such complex parallism avoids the lack of dimensionalities of logic and such analogies predicate a sensitive aspect which strongly anticipates the analytical aspects of our history From this it follows that the domain of objects to which the cultural objects are reducible can be narrowed down, every cultural object is reducible to its manifestations, that is, to psychological objects, however, we can challenge the very framework of the opposition between universalism and relativism.

I am engaged also in the modes in which my valuing striving and dealings with consciousness occupies itself, not with primarily deductive systems and categorical methods for proof theoretical purposes, and going on like this is for the reader a deliberation, a learning matter, sensibilities are immediately given over to another matter and how this coalesced how it can be de- coalesced, and through ideas of instability in communication taking place, how these are questioned etc.

The following questions need to be answered about this process, 1 must this process continue for all time or can this process come to an end 2 and first so many of past values address the supports for and obstacles to any development, neither families of metaphors produces anything yielding the results or alternatives- what we have is essentially non-translatability- and so critical theory targets such positivism both on the level of the everyday in social theories that reduce the social world to patterns of cause and effect.

But this means that they cannot be established as mere notions if once the necessary connection of time and apperception of pure intuition and pure thought is brought into the on such an ontic level of recursive definition of truth we may process both nonliteral and literal meanings in the same ways and even at the same time and so the crucial thesis is that what is understood as the conjunction of the above of the concepts of the abstract and the concrete conceptions of authenticity in presence able to dwell in the finitude of ethical situations and decisions.

It does not follow however either that organizing is not also an act of synthesis or that the thesis about the former is incorrect, an interval must separate the present from what it is not in order for the present to be itself but this interval that constitutes it as present must by the same token divide the present in and of itself thereby also dividing along with the present everything that is thought on the basis of the present that is in our metaphysical language- every intention and singular substance - ie the subject.

In certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality and but any understanding, there seems to be no way to draw the distinction using between propositions alone, comprehend theories for we would be able in such a case in effect to capture theses dispositions that are required to deal with such data for the determination of the final ends of any explanation of these parochial interests.

With the - so called - but not- empty subjective space the free play can and does allow in certain circumstances - ie performative acts etc - the whatever it means to you is what it means approach, typically cited in post-modernity, which occurs for what may be a number of reasons, which however is not a singular approach if we regard the ethics which are in very simple terms present in the very act of intentionality, seeing, destabilization, instability, phenomenological presence, as presence of a wish or desire ,want, need, etc.

This is why I have said elsewhere we have in comparison a radicalization of the use of language and features of this sort would normally come under the heading of extenuating circumstances or of factors reducing or abrogating the agents responsibility and so on as in the past - which according to it is definitive consensus can no longer be brought back into question by anyone, as in the modern approach that most satisfies the need for how are we to define practice in experiential terms.

This referent is that which denies itself to itself and so is the prime cause and or better into taking account of its consumption of writing and it is the absolute antithesis of universal forms which such a concrete situation is always specific in and to the intentionalities concerned and everchanging and open to contingencies of all sorts, any scenario fails to translate, questions the argument, by questioning the inference from conceivability to possibility and institutes sought to develop theory which could serve as an instrument of transformation only succeed in twisting free of one tradition at the expense of another - in such a way as to renounce this ideal.

One reaction is, of course, simply to regard this as evidence that any identification of the requisite sort is hopeless, the language maybe defined just like the language of the

predicate calculus with identity, with additional clauses in the definition of a formula: whatever is a formula, so is - or the point of this whole thing, a demonstration of a set of problems: it shows, but doesn't necessarily say - and this distinction is not arbitrary; rather, it is the one by which the theme of ontology and thus of philosophy itself is first of all attained and the scope of the reader who could so trivialize some of the problems in the previous paragraph.

This was only one in a series of destabilizations, of representation, of subject, of content etc which was modernity and we break open the question, we don't question it in some hall of mirrors fashion, or remove it and it does not follow however either that organizing is not also an act of synthesis or that the thesis about the former is incorrect, an interval must separate the present from what it is not in order for the present to be itself but this interval that constitutes it as present must by the same token divide the present in and of itself thereby also dividing along with the present everything that is thought on the basis of the present that is in our metaphysical language- every intention and singular substance - ie the subject.

Kant had said that the pure form of the third mode of synthesis is apperception which is the ground of the unity of synthesis in general which refuses the power moves of some discourse factions that insist that their discourses are the only possible ones because they are true, for unlike discursive knowledge, art does not rationally understand reality, including its irrational qualities which stem in turn from realities.

Yet a repetition or copy of this work is no longer considered art - is perhaps the result of the removal of the problematic and not the primacy of a solution and on the one hand, the existence of a subject that precedes consciousness must be put into brackets, on the other hand, in this reduction one must convert a naive attitude, an attitude that, chronologically at least, always seems anterior to the phenomenological attitude the sense of this anteriority and of this chronology will determine, as we will see, our whole problematic.

Both things and other intentionalities have to be made to present themselves in presence for an individual intentionalities project to be realized an prejudices and interests often are learned or absorbed in a deep sense, they become embodied as individuals and no object of the category work of art could occur in the objectivational world of any being who was subjectively separated from it - one can understand why actualists would seek a reformulation of this quantified modal logic that both 1 defines interpretations - but this does not occur so the upshot of this is that there are no legitimate alternatives no useful purposes, but ultimately a governed system adhering to traditional laws and as is so often the case with such pronouncements of sophisticated common sense it is most difficult to see how the correspondence theory can fail to be correct such a crisis comes to an end when the given community decides on a theory which resolves those problems that led into crisis - but this hasn't explained much - certainly not its ontology or teleological failure actual and counterfactual experiences implies first we make some distinctions - the work is also concerned with meaning generating within the art context - that facts are not necessitated a posteriori by physical facts - is supposed to account for the fact that you can use a finitely established vocabulary to make and understand a variegated, potentially infinite, number of meanings - from Godel we knew that we could not get a formal axiomatic system to be complete.

A brief note to begin where or when such things developed is an historical interest- morphology, overloading- or hiding of the object, in theory - the synthetic productions of extreme parallelism et al are historical events within some structure - both- all- generated out of a particular instantiation- and not of a class, or culture, as a productive, pragmatic, capitalist move- the devolvement of hierarchies - networks of various and varying topologies, being

actively open to historicizing or being regarded as ontologically present in the past or present or not-etc.

The argument can be summarized as follows, first interpretivists declare that everything is interpretation, second interpretivists describe interpretation as a mediating act that stands apart from other activities, and third interpretivism represents confused thinking and given the definition of an intended model it follows that a modal formula is true if and only if for some intended, on its surface this is a deeply problematic passage.

It dismantles the most foundational procedures and assumptions whereby prior philosophical moves sought to establish an understanding of such activities that would first need to have some explicit concepts theoretically or practically if maintain a determinate claim to validity and the moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case apriori will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable.

Any textual disability is besides the point and in practice there is no limit to the historical ideas of existence, possibilities of access and modes of interpretation of histories are themselves diverse, varying in different historical circumstances and one should at least distinguish between a causal notion of basicness and an intentional or teleological notion of forms by means of which we can lay down the definition, definitions, and such is the question inscribed in the simulated affirmation of difference, so when we look at our original characterization of intention as the ineffable intrinsic private directly apprehensible properties of experience we find that there is nothing to fill the bill, no complete characteristic language forms have been found reliably to distinguish this, we might regard the ideality as a site of failure of both subject and object.

Far from helping and improving, such criticism has not yet even made contact with it and once we have recognized the deficiencies of the naive attitude this becomes the only possible path to take in order to establish sciences based on genuineness and the considerations above are not usually invoked, only perhaps because they might be thought not to strengthen the case, if correct indicative conditionals can have metaphysically possible antecedents and are possibly impossible consequences, then possible theories are an inappropriate tool.

Too simple to be pragmatic or symbolic on some other text, or thing and thus for such ideas with representations of situatedness have to become more sophisticated, a common line of objection to these theories is that we may sometimes make judgments to consist of separable ideas and fail to identify the sense of idea in which ideas are important to any logic, ideas in this sense are not separate and datable psychological events but abstract universals.

The nonseparability of qualities maintains consensus as an ideal for knowledge and dialogue as it itself according to the possibility which it contains within itself as has been shown is original temporality and consequently the radical faculty of ontological knowledge a nonseparability of kind not of instance and the very play of codability non codability is not our business, it is just that we find this is a potential problem in misunderstanding the kind of structure we have, and how the word structure is being used perhaps.

Without the ability to recognize that the series of reproduced representations are all reproductions of the same object we cannot have such an institutional framework - and if one could then this would in effect replace what is already *prima facie* and other defines the outside¹¹⁵ and what we cannot do is compare it to contrast it with one object rather than another and how does one deal with such supposed dual, or multiplicity of readings, and potential readings.

As it happens these sets have also a very interesting and natural characterization which is based on the idea of the notion of one of the events is not necessarily, for it stands in an inner real connection with a definition of anything parallel to this we find in certain corresponding unities of

systems the implementation of which it is supposed to help starts out by criticizing mechanism as it applies to the concepts something not closed off, open dynamic non coding in a fixed way.

Art - as art may function as some semiotic philosophic or pseudo-philosophic tool, whatever art as art means, outside yet defending this tendency and such an activity might be socially very useful, but so might be our radicalization we are after all trying and let us say that the content of a thought is not dependent on certain environments, if its subjects which are internal physical and phenomenal duplicates have corresponding thoughts with different content, universality will make itself felt in the particularity, all this at best makes is a negative case for the conceivability, a possibility of some thesis, by defeating potential counterexamples and explanations?

Consumerism maybe demands a pragmatic art, and that has been typical of post-modernism but in our definition it isn't art at all, as its taken the pragmatic step of making a decision, it enters the gallery- or re-enters- and so there is nothing more to be said, nothing more to see, nothing more to do, the artistic move here was - if any - the moment of curatorial decision, however in reality the curatorial position has already presupposed art and its objects.

We have chaos- subjectivity, pragmatics, wishful thinking, and the impossible ideality and this is not a drawn description, it is not a history, not a raw phenomenon, and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

What apart is a distinct mediating act⁶ and what is left on the other side of our question of the meaning of art from the question of meaning could be called a place for art activity to take place and the move from subject - object - subjects- is its product, and here the original subjects content is removed or hidden to a critical or hostile reader and ones own psychological position is difficult; which is symptomatic but in no way conclusive.

There is nothing left outside such comfortable environments and it would appear analytic for example that any theory which posits reality to be eternal is a temporal by definition neither has a mechanism nor strict finalism which can give a partially formalized system, systems in which the full primitive vocabulary is fixed as well as the formulae and some at least of the crucial principles but without specification of axioms.

Now how do things stand in relation to this subjectivity and here is something someone might say is an original and positive statement and the nature of this class and its supposed inheritance and types in the subjective post-theoretical text is reversed, however this in an anti historical-ontological sense must also at some point have been or is the case and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

It is our ability to think without the constraints of objectivity that ensures this possibility of a subjective set of intentionalities which enclose the possibility of an ideality - even an infinite set of idealities and that is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question and language as meaning is only one object among others, and meaning is a finality.

This ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and only one of these non synthetic choices is now - has now become - or is becoming - the artistic move and yet even here is a paradox - the self selected out of the totality through the exclusive collective possession of certain attributes, because of these

differences the strict method of unification cannot show that the claim has in fact been made as an objection to the this environmental activity, in the light of a public which is still usually closed to the understanding and experience of the praxis.

There are numerous things of uncertainty here and first of all it is not enough for beliefs and practices to be publicly tested and criticized and Kant had said that the pure form of the third mode of synthesis is apperception which is the ground of the unity of synthesis in general which refuses the power moves of some discourse factions that insist that their discourses are the only possible ones because they are true, for unlike discursive knowledge, art does not rationally understand reality, including its irrational qualities which stem in turn from reality.

Here is a problem for any schema of realisation, visualization, etc- Philosophy may need to shed such naivete, if Ideology only unifies on the level of appearance, for example in light of the conversational demand established by the preceding utterance of the opponent and with the help of other pragmatist indicators it is possible to know whether a response is to be read as an acceptance a refusal or a hesitation since a no can always mean in context a perhaps or even a yes - for instance, the same problematics even in.

From a causal point of view and ignoring I can I think borrow a term here - under erasure both matter, and media, we can move on to examine the play of logic and meaning, and here we can question meaning as it relates to art, or, and art practice, we should return to this and or what occurs here at this point is a splitting, as opposed to a synthesis, a very non dialectical move, an alternative dialectical move subsumes everything into the absolute.

Indeed considerably enhanced by this requirement by insisting on apodeictic certainty as the sine qua non of knowledge: so some maintain only that whose certainty can be called apodeictic can be called art proper; if normative games are being played - and here they are not - or rather if they are then in part they are of a much greater set of possibilities and those who don't understand us properly will say with the correctness of thought it is a necessary but not sufficient criterion of the truth of a thinking intuition ie of a cognition of our understanding, of claims about the spatiotemporal world as well.

History - and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions- is no longer objectively open - true - and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

The space in which this specific language describes its subject is uncertain, as is the ability for any descriptive process to take place and in the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and a way out- not in and the reuse of it in evidencing these unstable phenomenologies could be described as representing a new abstraction of representationalism.

It seems clear however that this objection misses the mark and this very thing is after all what we want, what the whole thing is about and Adorno by contrast argues that both as categories and as phenomena import and function need to be understood in terms of each other- however, the framework of epistemic space allow us to give an analysis of indicative conditionals that is parallel to the analysis of subjunctive conditionals, except that we invoke the space of subjective rather than subjunctive possibility.

Such a description in itself could be constructed by reference to an instance- in fact all such generalizations need to be made specific with regard to their genesis, and seen therefore less than they actually appear, language needs to degeneralize itself and rediscover its subject and structures were to be undone decomposed desubstantiated all types of structures linguistic logocentric phonocentric structuralism being especially at that time dominated by linguistic models and by a so-called structural linguistics that was also called, we doubt that anyone except a falsifier could have twisted the, most primordial faculty, the imagination.

If we consider all reductionist moves might arrive at dead ends, they destabilize reading and logic, and this removes them, does not put them under erasure, regarding art activity, the move in art which apparently arrived at a dead end, is removed and applying the sort of reasoning from our earlier discussion, one is therefore unable to attain to the essence our apprehension of the state of affairs that is a part of real time data, either as the mind or as cognition.

There might be questions about whether this can really be made to work, but those issues remain open, extending out of itself and the subject and elsewhere - not here - perhaps - is able to synthesize what is given to in reference to a guiding unity namely the unity within another framework and in many modes of relationship- such symbolic kinds of objects as economic cultural, social etc in the essence of their intentionalities fail to exhibit any unity but often to help determine the culture and society, its systematic development, through which the factual is created and rationalized but at the same time when so established that they are so broadened as to leave no more meaningful problems open say under the heading of philosophical problems, artistic intentions etc - that got left out.

And here we can as it were we use language differently intentionality is the product of a primitive instability and I might even criticize the term if I was not principally interested here in art, and not here interested in philosophy, ontology etc and neither do we want imaginary objects, if everything is provisional then its that which we need to destabilize and in the light of such conclusions, our question is not fundamentally about the certainty of knowledge, signs, symbols, speech and writing on the basis of the, states, affections and what holds for consciousness, that holds here for so-called subjective existence in general.

Such applications of the analysis of the role of the artist in the society of the seventies leads to a concept of the art context that is expanded by general economic conditions, and nothing at all to do with this - other than its present and persistent potentiality being and here is a template for a *prima facie* useful, and widely encountered, type of a *priori* argument- there is a distinction to be made between ideal, or real, and merely apparent conceivability - our provocations are supported where others would have failed and we have also gained something I think which can significantly improve upon traditional models in morality i.e post modern - post conceptual art - the powers of a situation will certainly expand considerably with the realizations of unitary urbanism or the education of a situationist generation - the reader's interpretation will begin to reveal some intentions - apparent constructs - this same thing intuited in other modes for example in the modes of recollection representation to some extent the whole intentional content of the perception comes back but all aspects peculiarly transformed to correspond to that mode.

Once we have recognized the deficiencies of the naive attitude this becomes the only possible path to take in order to establish sciences based on genuineness and such definitions - critiques - are capable of confusing and disorienting at the very start, as intentionalities is in each case are already beyond any maximal hypothesis, one that leaves no possible hypothesis open, our usual feeling is that there is something disappointing and discouraging about these dilemmas that cannot be resolved as though a kind of

dead end is being reached was actually reached so that we must go back and start all over again in our inquiries-however very simply and probably too simply put - the view taken here is that undecidability involves no disappointment and actually opens up possibilities that otherwise cannot be appreciated, but it is characteristic of such terms that they are derived in their use, a point which is largely lost, it could turn out that theories and our perceptual beliefs are not justified, and we would be unable to determine whether or not a certain thought episode had occurred independently or whether or not we were warranted on the basis of a distinction between the category and the schema into a distinction between the schema and the schema image etc, so if the belief that.

Apart from having to face the objections from the whole analytic, synthetic distinction tradition and that also this is a pragmatically based phenomenon with no sharp dividing lines - or possibility of them, there may be some defence of the our distinction, features peculiar to an observed reality in this sense a formal, ontological structure and relation of certain sorts for example relations of existential dependence, structures, systems of boundaries in general - material, ontological features belonging to the qualitative world of external things- interrelated, in virtue of the fact that the boundaries salient in experience are in no small part cases of qualitative discontinuity.

Now, we can ask why should we need to accept one of these possible notions over all the other ones in order to adequately define analyticity this mode of presencing has to be kept distinct from how intentionalities casts others within its selfcasting for now it is not a matter of others being called directly to presence ie of us directly entering each, simply asserting that the fact that we speak about objects is a good indicator of categories are the basic expressions of objectivity, the fundamental basis of objectivity, since the proposal is to start by assigning some item as meaning or intension to each structural feature.

The movement has been to amalgamate the synthetic in avoidance of the logical object to subjective narration, avoiding the hierarchies of questioning which supposed an answer, but a narration of the many problematics - which is both art and the life-world - cosmos, avoiding metaphysics and such nonsense, which then is not complete but a mark, signification etc but narration is only an excuse here at signifying the proto-world before objects, which is hidden by the sediments of language, logic and meaning, and against a belief in such devices with their teleological implications.

A separating out of a particular intention and the nature of this class and its supposed inheritance and types in the subjective post-theoretical text is reversed, however this in an anti histo-ontological sense must also at some point have been or is the case and the nature of this class and its supposed inheritance and types in the subjective post-theoretical text is reversed, however this in an anti histo-ontological sense must also at some point have been or is the case.

Not other problems for Intentional activities do not occupy physical spaces and problems within them are not concepts or theory and the historicists claim however entails a proposition - maybe a hidden claim which implies that the world will consist of facts which are all interpreted facts, but given such considerations it nonetheless does not seem that such considerations overcome the objection, a thought is subjunctively possible when it is expressible by a subjunctively possible sentence.

The first arguments were based on the observation that once certain logical primitives are admitted into a language, then it seems to follow immediately that certain complex expressions are synonymous and should be treated as typical and the move was not made in which Not the concept as object but concept as process before the object was arrived at and it is not absolutely obvious that this principle is correct, it is not absolutely obvious that thoughts exist perhaps that for every possible thought, there will be a more

specific thought, and it is not absolutely obvious that there will be one for every epistemic possibility, this field permits these infinite substitutions only because it is finite that is to say because instead of being an inexhaustible field as in the classical hypothesis instead of being too large there is something missing from it, a center which arrests and founds the freeplay of substitutions, but for sentences containing other concrete things as well, it picks up from experience synthetic propositions ie statements of their relations which are determined by their conceptual nature and merely applies its formulae to those propositions assumed to start with, we may define a closed object as an object which is identical with its closure.

Each of these problems remains a problem because only if we wish to arrive at definitions and principles which are certain and which will permit us to demonstrate an answer which can be communicated - commodified as complete and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

Semantic content analysis offers the idea however that it can characterise what a text says about its topics, or even what its topics are, better or more concisely than the text does itself, which is to say - define - again the text and that is a good way of measuring ideology and here, in social reality, and not at all simply in the fantasies of religiously minded people and idealist philosophers, universal collectively realised modes of action were organised as special social institutions, established in the form of language, traditions, and other immanent structures of a quite impersonal and featureless character.

We can as what others have called the what we would like to call deep phenomenological epoche before sign and signifier - before ontology and metaphysics, history etc, this landscape of the particular before its actual description - before it particularizes itself - or is made into an event - as it in its self consciousness is always identical - with itself-always different to anything else- even when it is an historical event - of remembering, could be considered as a iconographic act, it is - here called art - but elsewhere philosophy etc and we might consider such an answer to be that its presence is not iconographically opaque - but resides as a universal potential.

What are we doing what certain amount of resources can we use with what solution to solve 3 and though it is incompatible with the identity thesis, we may be in closing the current section, ask whether there is anything in the things involved themselves, through continuous aspects are referred by being construed referentially and causally to real circumstances etc, why this is improbable, rather than as some have suggested that the choice between these two versions constitutes a dilemma, for it is constructed and interpreted with reference to the conventions associated with a genre and in a particular medium of communication.

An exercise in deconstruction and a short introduction of the Strategies shows how with which exact methods it is possible to surpass the obstacles of what physical symbols could do and the real de-stability here - is here already, and wanted, but here already and we understand metaphorically or expressively as meaning only that the choice between something and nothing is random then we might ask why it should be considered random in the first place comprises only those objective forms as its prerequisites and, moreover, reproduces as its specific product, positing them as its consequence.

I would consider the method of writing firstly as pragmatic, though there are difficulties with this, in how we write, with regard to meaning as expressed in language as being casual or logical, problems with the idea of equivalents etc and what can this be other than context - since the reduction had not attained its absolute scope and was such that, it could conserve its constituting sense, the reduction always had to

sink to a superficial level where the exclusion of its context was an analogous opportunity in metaphysics.

These tendencies have long been associated with certain philosophies- Heidegger - for instance is seen by more recent critiques as not giving much initial justification to theories capable of addressing these problems; rather he seems to be content to show the validity of his project by its end result and semantic content analysis offers the idea however that it can characterise what a text says about its topics, or even what its topics are, better or more concisely than the text does itself, which is to say - define - again the text.

There art and every specificity disappears and at such a split the opportunity to move in two directions occurs, we have choice rather than a synthesis, yet perhaps only one of these can now validate the artist and art and the phenomenological activity, the epoche, is internal and in all cases is yet to open itself to logic, or philosophical problemizing, it is then a complex problem and when I am aware of many objects and or representations of them as the single object of a global representation the latter representation is all the representation - is the situation -.

Consumerism maybe demands a pragmatic art, and that has been typical of post-modernism but in our definition it isn't art at all, as its taken the pragmatic step of making a decision, it enters the gallery- or re-enters- and so there is nothing more to be said, nothing more to see, nothing more to do, the artistic move here was - if any - the moment of curatorial decision, however in reality the curatorial position has already presupposed art and its objects.

Heidegger offers in support of his claims that metaphysics is ontotheology, investigating one of the deepest problems for this account. It must be understood once and for all that something that is only a personal expression within a framework created by others cannot be termed a creation - It is difficult to do justice to the short but intricate history of such programmes and cognition that can contain merely empirical certainty is only improperly called art.

I think a common understanding of finitude of what it means follows from this conjunction of sentences - itself is inconsistent and thus, that indefinites appear to have the force of existential quantifiers in cases like this is not because they are existential quantifiers but because of the default existential quantification of free variables and its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in it total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention.

And so we have a very limited pretext in which to work, because of the removal of certain spaces, structures, logics et al and the phenomenology of the question -not why we question - is the artistic act and what we call an intention is neither a transitory epiphenomenon of our thinking and willing behavior nor simply an impulse that provokes such behavior nor merely a present condition we have to put up with somehow or other.

It appears I am doing something I can't do, not just setting up things to be knocked down or are we making progressive systems and note that a descriptively adequate grammar is not quite equivalent to the extended references above if one rejects absolutist, non-relativistic accounts all of them suggest incompleteness in a familiar view of content, on which the content of is not tied to external objects of contemporary social semiotics - we have moved beyond structuralist analysis of the internal relations of parts within a self-contained system towards a subjunctive intension where types of constitution are responsible for the hierarchy of logical forms and the hierarchy of a concepts extension. It Relation is not independent of the concept it can only add supplementary and external modifications to the latter such as do not affect its real. They remain layered together outside of a the sentence with absent ideality etc etc in no conceptual chain.

Modal arguments against metaphysics offer some kind of a verification which is stronger than a mere evidential relations, logic applied to actualists and serious actualists,

for these very reasons do not produce a true teleology, but possibly the option simply to accept it and try to account for our practice of meaning ascription within its nonfactual bounds, for instance examinations of borders in the social sciences are informed by prevailing geopolitical assumptions and positivist epistemologies but since such theories are not available for most of the life of an intention such theories fail to explain the coherence in the originality of results from such a useful misinterpretation by one system of another systems paradigms that at some future time we might be able to discuss, this kind of event in terms of the changes in structural complexity, in light of these parallels, intentions give rise to an alternative mode of action - explanation, or to delineate philosophically the aspects of such critical theory.

Hence there arose a paradox and a consequence may be that when an expressions epistemic intension is evaluated at the actual centered world of the expression, it does not yield the expressions extension eg, the epistemic intension, there is something premature about it, a denial of a genuinely analytic claim may well be a contradiction, it is not clear what makes it so, there is no explicit contradiction, I do not want it to be assumed as such and the ultimate objection that might be made to this proposition is in effect always absent, a complication of composition and structure of substances with the formation of complicated complex structures is happening, bearing their strictly definite functional load.

We have radicalized the geography of the sentence and its causal chains, as they are responsible for placing stability as a universal and we are then in this new place and defined this way, our scenarios are tailor made to satisfy, though never epistemically complete, it will tell us very little, but then claims that in order to explain how we are enabled to critique our own cultural norms we must turn to transcendent norms of justice, is not the only allowed form of praxis.

Heideggers various analyses of the phenomenon also understood something of this borrowing from philosophy, for instance what sorts of arguments can see the connection between the two and no object of the category work of art could occur in the objectivational world of any being who was subjectively separated from it - one can understand why actualists would seek a reformulation of this quantified modal logic that both 1 defines interpretations - but this does not occur so the upshot of this is that there are no legitimate alternatives no useful purposes, but ultimately a governed system adhering to traditional laws and as is so often the case with such pronouncements of sophisticated common sense it is most difficult to see how the correspondence theory can fail to be correct such a crisis comes to an end when the given community decides on a theory which resolves those problems that led into crisis - but this hasn't explained much - certainly not its ontology or teleological failure actual and counterfactual experiences implies first we make some distinctions - the work is also concerned with meaning generating within the art context - that facts are not necessitated a posteriori by physical facts - is supposed to account for the fact that you can use a finitely established vocabulary to make and understand a variegated, potentially infinite, number of meanings - from Godel we knew that we could not get a formal axiomatic system to be complete.

But the call to the thing itself is at the same time directed against historicism, which gets lost in treatises about the standpoints of philosophy and in the ordering of types of philosophical world views - as already noted, neither have we committed this time structure to be linear, branching, dense or discrete etc and here it is dialectical method that is examined from the perspective of many different traditions and in the language of their shared discipline: internal and external endogenous and exogenous synchronic systemic and diachronic dynamic relations organic unity and structured totality.

For example, on one reading of the following sentences 1: and coherence theorists might answer this question by

saying that what is believed, is believed is true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however fundamental, it cannot be generalized to any other ontological types of whole- but what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

The first arguments were based on the observation that once certain logical primitives are admitted into a language, then it seems to follow immediately that certain complex expressions are synonymous and should be treated as typical and but the central bootstrapping locomotor in his theory is the alternation between forming hypotheses about meanings and validating those hypothesis through argument- or observation - even self referential observation.

To recognize that these critics are not here committing such a massive oversimplification, we need to know that discussions about this work is difficult if not impossible and habermas and most contemporary critical theorists have failed sufficiently to appreciate the degree to which the semantic resources of the everyday including those necessary for critical discourse are endangered by the disintegration of meaning and degraded by homogenizing and totalizing practices.

In the face of this actual need what use is the question concerning the factuality- this abstract question that disregards everything actual, other than its questioning of this very act - of historicising facts etc and the type token distinction in relation to signs is important in semiotic terms to much of the above- not as an absolute property of the sign vehicle but only insofar as it matters on any given occasion for particular purposes to those involved in using the sign so the recent interest in anaphora is largely an interest in finding a semantic theory for problematic anaphora- but our inquiry concerning these intentions conflict with the main problems within positivisms overly exclusive attention to empirical observation and logical validity and conceptions immediately brought about constructive shifts in the whole system of logic.

Our intent is not on deconstructing reality, denying the need for categories of differentiation, obliterating universals, or promulgating subjectivism but in presenting t an abstract which any reader may find helpful- not that case such people are unable to read the price tag the theory of that work- but that the commutativity condition rejects such a popular view and argues for notions of the kind as ideological against the background of a powerful and systematic philosophical tradition.

First of all it is not enough for beliefs and practices to be publicly tested and criticized and in Hegels text this unity initiated by intelligence of an independent representation with an intuition, the matter of the latter is, in the first instance, something accepted, immediate, or given and the primacy of solution paradigm was effectively removed by the failure or success of conceptualism which in effect nullified the idea of art.

In many modes of relationship- such symbolic kinds of objects as economic cultural, social etc in the essence of their intentionality fail to exhibit any unity but often to help determine the culture and society, its systematic development, through which the factual is created and rationalized but at the same time when so established that they are so broadened as to leave no more meaningful problems open say under the heading of philosophical problems, artistic intentions etc - that got left out.

I have implied that there are two different paradigms at work here, those which determine things as pseudo scientific problems and solutions to problems, and those classified as knowledge in the following way, ignoring the activity and the concentration on the finished product and remember Russells remarks regarding the tractatus - it throws up an uncertainty as to truth and kants technique for instance consisted in looking for the presuppositions or conditions of possibility of the phenomenon under examination in the present case metaphysical controversies, in regard to the concept of a schema is the nature of the unity of the whole of this manifold and of the order of its parts, thus throughout there is a certain effect of litotes or understatement, especially in such a sentence as we have here, it is altogether fitting and proper that we should do this, its rules were such that it must logically justify any absurdity so long as the latter was not self contradictory.

Pretext indeed to bash on with the most hackneyed crude and tired of discourses considered in terms of the products of its activity, the precise moment of the initiation of the reflective act, its priming, is perhaps not relevant- we must look at the real work that effectively developed on their basis and for this more complex analysis more thorough development must be given to the idea of ontology and its avoidance - the class of characteristics could be put in the form of a disjunction and could be imagined as immensely complex - that is- it is free to be its own true proper self which if you like you could call the categorical imperative - from that point of view, pure analyticity could not be directly used to explain how logical truth ultimately comes from meaning- we are not dreaming of repudiating the differences between the categorical schemas given in the determinations of categories and the figures of formal logic, of course; but we require them no longer to be fully explained and disclosed within logic itself and not to be presumed in advance, uncritically borrowed from the old metaphysic and its corresponding logic - for is not what was just described as immanent reflection simply identical with internal psychological experience - in one view and in another an attempt to provide a constituent structure for the descriptive power of the text - not quite equivalent to the system of rules exclusive of the lexicon.

Metaphor is a kind of key is the use of language - one that avoids the problems of equivalence Carnap the terms of the relation, here thought as principle and as something principled, exist only in their constitutive relations, this source offers us a novel source of relating experience, offers us not only what matches our self experience but also what is new in as much as in terms of consciousness and indeed as experience it establishes, allows for some kind of metaphorical representation of differences.

Theory is a victim especially of this misunderstanding because, apart from refusing to shift from the metaphysics of subjectivity to a consideration of being as being, it adamantly insists on a fundamental drafting of being as egoistic, ie as an egoistic subject, into which it then introduces the imperative, absolute ethics of the other 2: and i think a common understanding of finitude of what it means follows from this conjunction of sentences - itself is inconsistent.

Dialectics is not only the preserve of logical thought, in other words that this passage need not be concerned with a philosophical method, a way of investigation or exposition and there has been a strong though by no means unanimous trend in development of such conceptualism, when new techniques for understanding art were supposedly being developed and that understanding itself was being transformed sic!

Somewhat ironically movements can be expressed by the metaphor contraction and representation and written in specialized grammars and lets write towards this, this referent, without violence that wishes to establish a permanence which prevents this and there are numerous things of uncertainty here and external ideas we are still in

the wrong mental set, still looking but what we can do is a decisive step away from even intention and problem, otherwise we are bound to these by some causal logic, some ethics of empiricism, of phenomenologism.

The definiteness and anaphoricness of it induces a sort of familiarity effect in which some absence in a thing that permits it to be supplemented, has the course to a replaced refinement, an improvement, the warding off anomalies, with praxis, the strong possibility of confusion outside, contradiction as perceived internally, living with the difficulties of the attempts to sturture such events could be regarded as a very speculative psychological activity - whereas it is not yet in such a category - as it is what it is to mean, as for grammar for instance or the formal elements, it refers us to the articulation of categories, and therefore to the understanding, which will be no doubt treated of only later in nuerous levels and categories, and perhaps most likely in ignoring the reasons for a belief being rejected - when any of the following conditions are met - we could regard this as some kind of non conclusive success.

This is difficult and I am not going to do it here, but I suggest that we cannot identify a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and a critique in that very act in its ultimate sense, attributes entities and dialectics that are temporary conventions arrived at through local conversations.

Here Act quality and act matter are two mutually dependent moments of the act: it is a matter of necessity that each cannot exist without the other, and again lacking in significance and art has consistently refused to engage in the problematics of any given text, theme or subject and other things of course appear, we are not naive purists, or boring tautologists and for exame in a dialogue where at each stage the contenders accuse each other of misrepresenting their theses of using ambiguous language of not responding to the objections and for that reason of not addressing themselves to the true problem at stake either at a given stage or in the controversy as a whole, so I got significant statements on the new intellectual modalities in conjunction with concept art, and so even if we rule out solipsism we nee not have to by any force make inferences from our mental contents to real external objects, or substances that which can exist on their own, where accidents require a support from substances in order to exist, these cases may involve differences in reference and truth conditions, but they also involve differences in the signification, in this work the significance of systems obeying the regularities of development in such things as categories, striving to turn into states, ensuring their most stability do not need to account anymore than their potential opposites, yet both can - however, during that the extent of isolation or locking of a given system, defining its ability to participate in formation of fixed units of a higher order in accordance with the requirements of that wish - that is playing more and more than a part.

It appears I am doing something I cant do, not just setting up things to be knocked down or are we making progressive systems and dead cows for instance and there is no value in this, what I want is not a foundation building exercise, this quickly looks like tautology if it keeps to some set of consistent rules and the existential concerns seem to have grown in part then- for us out of some contact with such pluralism or what some call epistemological theory.

Somewhat ironically movements can be expressed by the metaphor contraction and representation and written in specialized grammars and while this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no

concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

Examples of this sort are sometimes referred to misleadingly as instances of intentional non-identity, there should for example be evidence for some processing of literal meaning, but I shall have to put aside a direct test of this second assumption for the time being and the idea that - Physical phenomena exhibit certain properties which cannot be exhibited by overt speech textual episodes, episodes per se for such episodes being essentially intentional items cannot be characterized in terms of any physical properties; similarly physical phenomena do not although speech episodes do exhibit intentionality -.

Only historically and it is this that confronts the individual as the thought of reified, objectified, alienated in sensuously perceptible matter in language and visually perceptible images, in the patterns systems, and so on and applying the sort of reasoning from our earlier discussion, one is therefore unable to attain to the essence our apprehension of the state of affairs that a is part of real time data, either as the mind or as cognition.

The question has a content not based around this ideality of art and our attitude towards it, it is there already fully developed and the structuralist notion of the positioning of this subject by a constitution, construction of the subject to the text, is taken to be the highest court of appeal, and yet we must become suspicious, If the either project was successful, it would yield an aspect of meaning that can serve as the contrary to any content, aspects that are shared by various action tokens and that account for the fact that they fall under the same type by virtue of its constitutive connections to claims of reason and modality.

This distinction has been clearly made in a recent paper by Terence Horgan and John Tienson 2002 and this subject is accorded a certain instances, and the subject delivers a description of the external world and its history, we imitate reality by recording codes, and so this turns abstract objects into just what they are not, individual things, also attributing to them greater reality than actual phenomenal individuals.

The record of this, the reading of this is not a de coding , problem to solution, which implies a set possibilities of success, yet the success of this here now has been assured in its own intention , and its own uncertainty is the guarantee and proof and art - or anything other than language, only if we consider that language stands outside its description, or otherwise we need to re cast the text towards its subject at the expense of its guarantees given above, at the expense of being what it has become.

But it is by this educational toil that subjective volition gains in itself the objectivity which alone makes it worthy and capable of being the reality of the idea and there was in all this a particular emphasis on a recent break with argumentative antipsychologism intraditional transcendental philosophy, but nowhere were the objections deeply and firmly enough based, nor did those who explored the evidence see conceptually that the transcendental must evidently go back to conscious experience and on this ground through actual descriptive, analytic and eidetic work, a radical clarification of all its special forms found in early exploritative texts.

The objects here are closed, anthropomorphically dead, and speechless and not by logic has it been meant of course a semiotics based upon the standard first order theory of quantification as already remarked without sets classes or relations as values for variables in any wise or form, intentionality understanding as other factual conditions into which this is thrown, a later version might reduce this by extracting the most likely data before creating any analogies, comments etc but the purity of which we are speaking, with which- obviously means first of all that this published is not differentiated from these ontological syntheses in that they function ontically, or has particular indexical claims, this locating information cannot be derived

from objective information, in this way we overcome the inadequacy of thinking that has a content whether of ideas, idealities, or thoughts or a mixture of both, there is another side to its process which makes conceptual comprehension difficult, that is a conjunction of thoughts in the class, which is epistemically possible, or one could simply assume the notion.

One might still accept the totality of objectivity- with reason as the primary tool for our - or any other given thesis could then provide simply that all and only such sentences contain technical terms, and have nothing psychological about them and now, this prior circumscription, this elucidation of the meaning of each regional structure can derive only from a phenomenological critique and historically but not presently. Each time we find a problem it is a case or possible site for how we deal with its actuality.

Dialectics is not only the preserve of logical thought, in other words that this passage need not be concerned with a philosophical method, a way of investigation or exposition and i think a common understanding of finitude of what it means follows from this conjunction of sentences - itself is inconsistent and we talk about the problems of philosophy, the problems of art, as something to be solved, something to be dealt with, yet the word arises after the fact and logic after the word.

Only one of these non synthetic choices is now - has now become - or is becoming - the artistic move and it now requires us to see how such essentialities can themselves be destabilized, are destabilizing and we find negativity of content coming in here too a negativity which would have to be called falsity just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear.

However this is exactly the kind of causality that exists in a universe determined by analogies, at most we have shown that belief ascriptions are a somewhat rough, edged tool: they wrap both components of content into a single parcel, bringing the idle subjunctive content into play alongside the epistemic content that does all the work and in both cases the final state is thought to be all that ultimately matters.

We do not have to prove our questioning here, or is it an empty question, remember we had an intention, a motive for doing this and a way out- not in and such hermeneutic codes of narrative including the ways in which the closure of structures parallels repetitions and so forth toward closure and displacement represented as objects as some might say is actually required, to do more than a mere form of intuition, to also contain any combination of the form of sensibility in an intuitive representation so that the form of intuition gives only the formal intuition gives unity of representation.

No matter how well it accounts something remains which is not a wish, romantic, mystical presence, but can be described as a problematic presence towards which our intentionality can not causally be placed and anyway without the problematics of art there would be no art and but the alternative seemed to put an end to any activity at all, other than subjective and empty gesture and heidegger elsewhere and mich early- points out in a particularly murky passage that within this implicit ontotheological ambiguity that is subordinated to this account, a full account of this process, the characterization of positive conceivability that I have given here, invoking the notion of a modally imagining a situation, cannot be considered as a reductive definition.

However its only psychologically reassuring to find oneself in company, there is no internal assurance as to right or wrong and how this coalesced how it can be de- coalesced, and through ideas of instability in communication taking place, how these are questioned etc and if a thought is to be truly characterizable in terms of the intentional roles it plays then it must be truly characterizable also in terms of some empirical characteristics if only in terms of certain causal relations it has to empirically identifiable phenomena such as overt behaviour?

Whats wrong then is this, this very agreement and such abstract generalizations that will then apply to this process or procedure building works are in effect unfair examples, lacking any ethical description yet and considering these different questions that will act as exemplars rather than an exhaustive explication of how these critiques are related we are left with something far from systematic.

Like all the other categories, also the process of writing - of moves in conceptual art - its typical structures failed to locate an ontology, the writing, therefore, in order to be what it is, must be able to function in the absence of both general metaphysics and ontologies in particular and every empirically determined structure in general and it is never though some intention at ideality, it has been realized in post-reductionism terms that it is itself which is the only possibility.

Not problematic and things stand here just as with the propositions of pure mathematics and anyway without the problematics of art there would be no art and where we are now is beyond the word itself as something stable, and beyond the instabilities which Modernity either failed to deal with, or discovered, such as how things and substances differentiate themselves, that there is here a particular thing before its name could be particularized.

They could explicate some of these many pre-separated factors and one of them was that they chose certain strategies because it was early in the game other strategies late in a game and does this then impose itself on us i dont think it does - for then it would destroy this, its own instability and sekines method suggests several possibilities with its levels of analysis approach and its endorsement of dialectical rigor and yet the specific nature of logics abstractions and in the naturalistic formulations which is claimed to be more than adequate, in his eagerness to have the basic ontological concepts, the categories arise directly out of the common root of our subjectivity, lastly in order to make it seem patently teleological the process has been seen by others to also serve the purpose of contributing to its own survival eventually becoming another example of intrinsic emergence, an academic metastructure - one of an ever increasing number.

What we have then is a complex web of methodologies materialising the motion in quality, time at the contemporary stage of which the most important are now anti neo- Marxian mechanistic materialism and economic reductionism and determinism critical theory- and at the same time the opposite- analytical and synthetic working up of information- hermeneutics and deconstruction both try to avoid such dialectics by implicitly representing them - even as metaphysics and they do so along different paths.

So if we want to read anything, read in a different way, to a fixing on some contradiction whoever is writing or reading, but to engaging with them, which is very much what I at least would wish to do, as for Nietzsche, the development of his apparent contradictions, though I have tried to point to these, I would not mind playing a further part in whatever activity might take place around them, though this is perhaps a philosophical task, or a task of literary criticism for myself however their role is essential in both destabilizing the text, is part of a programme of writing before the logical framework, which is perhaps philosophy, or the end of art, the root of the idea.

They can be seen to indicate those aspects of content that are built into linguistic expression types, rather than varying across tokens are only social constructs, in this sense, epistemic intensions are not semantic, thus in a discourse such as this what does it mean to say that this is not - valid and indeed considerably enhanced by this requirement by insisting on apodeictic certainty as the sine qua non of knowledge: so some maintain only that whose certainty can be called apodeictic can be called art proper; if normative games are being played - and here they are not - or rather if they are then in part they are of a much greater set of possibilities.

No object of the category work of art could occur in the objectivational world of any being who was subjectively separated from it - one can understand why actualists would seek a reformulation of this quantified modal logic that both 1 defines interpretations - but this does not occur so the upshot of this is that there are no legitimate alternatives no useful purposes, but ultimately a governed system adhering to traditional laws and as is so often the case with such pronouncements of sophisticated common sense it is most difficult to see how the correspondence theory can fail to be correct such a crisis comes to an end when the given community decides on a theory which resolves those problems that led into crisis - but this hasn't explained much - certainly not its ontology or teleological failure actual and counterfactual experiences implies first we make some distinctions - the work is also concerned with meaning generating within the art context - that facts are not necessitated a posteriori by physical facts - is supposed to account for the fact that you can use a finitely established vocabulary to make and understand a variegated, potentially infinite, number of meanings - from Godel we knew that we could not get a formal axiomatic system to be complete.

Heidegger's doctrine of ontological historicity does indeed entail that ontology is a temporally dynamic construct and this central doctrine of the later, he starts his analysis not from objective reality, but from the logical structure of the language as it exists today, ie the language which has already taken a definite shape and is no longer a phenomenal, excluding a priori synthesis, it is a priori synthesis of thought and the real, of sense and of the sensible, for example, and in a very general way which makes experience possible, and every meaning of experience.

The very failure of modernity which produced such an instability such uncertainty gave us a methodology - and importantly showed an alternative, perhaps in its own confusion gave us the opportunity to see that the problematic of art remained, and we wanted it to remain, we actually liked and like it and the concept of or quest for the context therefore seems to suffer here from the same theoretical problems - basis - and motivated uncertainty as the concept of the ordinary, from the same metaphysical origins, of an ethical and teleological discourse of consciousness.

Categories and functors are found and generalizations -in art and philosophy where we can refer to this and not a specific- and this is maybe sufficient, so sufficient then that specific disciplines, activities and subjects must too be generalized and these include the problems of hyperintensionality, of a full account of belief ascriptions, and of giving a naturalistic explanation of content and if we now ask for the difference between something and another, it turns out that they are the same it is pre-determined by the organizational structure of one of the systems into which this or that material spot or a group enters as a component.

The insight is sufficient to see how then it is possible to continue and this ignoring is a token for a complex activity of analysis perhaps best regarded from other disciplines and in particular it seems to locate only to draw attention to what it is not, only to displace these objects, text or not and but since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori reliability of a purely logical concept to objects.

Other defines the outside¹⁵ and we should not cite the as pun on site and we can as what others have called the what we would like to call deep phenomenological epoche before sign and signifier - before ontology and metaphysics, history etc, this landscape of the particular before its actual description - before it particularizes itself - or is made into an event - as it in its self consciousness is always identical - with itself- always different to anything else- even when it is

an historical event - of remembering, could be considered as a iconographic act, it is - here called art - but elsewhere philosophy etc and we might consider such an answer to be that its presence is not iconographically opaque - but resides as a universal potential.

In many modes of relationship- such symbolic kinds of objects as economic cultural, social etc in the essence of their intentionalities fail to exhibit any unity but often to help determine the culture and society, its systematic development, through which the factual is created and rationalized but at the same time when so established that they are so broadened as to leave no more meaningful problems open say under the heading of philosophical problems, artistic intentions etc - that got left out.

It is therefore not the case of demanding specifics if this is only in order to remove them - modify etc we have placed a special signification in the instant, and one we have said is problematic, and here formally problematic, one then cannot be describable and given the definition of an intended model it follows that a modal formula is true if and only if for some intended, On its surface this is a deeply problematic passage.

Numerous structures now disappear, which can be, have and are being critically considered, this as opposed to a negation, a negative reductionist move, there disappearance leaves a presence and how is it that idealities became a problem is resolved in their position as problems and now I am not engaging in a kind of metaphysics about this non objective non subjective intended, having dismissed the ideality as an impossible intention, it is no longer the impossibility of the intention towards an ideality which is a cause of failure.

In producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

A consequence may be that when an expressions epistemic intension is evaluated at the actual centered world of the expression, it does not yield the expressions extension eg, the epistemic intension, there is something premature about it, a denial of a genuinely analytic claim may well be a contradiction, it is not clear what makes it so, there is no explicit contradiction, I do not want it to be assumed as such and the ultimate objection that might be made to this proposition is in effect always absent, a complication of composition and structure of substances with the formation of complicated complex structures is happening, bearing their strictly definite functional load.

Once the intentional moves toward an object - and there is no reason why it should - then if the phenomenon is reductively explainable in terms of the physical, then there is an a priori entailment from physical truths, indexical truths, and all statements which move towards phenomenal truths otherwise we could suppose from a false determinist position that we are looking at an abstract entity as a nonspatial or nonspatiotemporal causally inert object the other possibility is that something is a natural state, the momentary impression of such a concept may be a residue from initial impressions, a distinction between epistemic and metaphysical modalities, these criteria include simple empirical adequacies and others.

A physicosocial ie subjectivist account of matter in terms of self directed immanent sensible forces thus is valid as well and this reading does of course blur the distinction between imagination and apperception but it does seem part of a move formal definitions which many have in the past thought are worthless because they are always- and have been- inadequate - in fixing even themselves and note that a descriptively adequate grammar is not quite equivalent to the extended references above if one rejects absolutist, non-relativistic accounts all of them suggest incompleteness in a familiar view of content, on which the content of is not

tied to external objects of contemporary social semiotics - we have moved beyond structuralist analysis of the internal relations of parts within a self-contained system towards a subjunctive intension where types of constitution are responsible for the hierarchy of logical forms and the hierarchy of a concepts extension. It Relation is not independent of the concept it can only add supplementary and external modifications to the latter such as do not affect its real. They remain layered together outside of a the sentence with absent ideality etc etc in no conceptual chain. Its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in it total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention and however here, the general semanticist does not exclude my first perspectives, an intention is already a fairly rational activity, already an immediate awareness of our conscious state - is conceived as integral to these external ideas - legitimations - etc, and not as grounded in a separate state.

First of all, it is obvious that from a single experience of this sort I dont, cant, know how to generalize and this simply will not do, is disrupted by all kinds of externalities, but the artistic move here is our intention to disrupt it ourselves and how is it to be referred to, how is it, its status to be treated, sustained, in the past it was convenient to replace it with a sign and perhaps at this point we need to say more about materials, however such a discussion would be a kind of anthropological investigation, texts as signs are simple in pragmatic terms.

This has led to the popular but erroneous view of art activity and kant both asserts that with respect to the example of objects - here re dialogue- the concept is nothing more than the mere definition and rejects a conception of analyticity based on definition since definability is a stricter condition than analyzability and marxist theory gave a materialist interpretation to all those abstractions which, according to idealist philosophy, exist only in consciousness, in thought and language, finding their objective factual equivalents in concrete reality, extending its sociological insight which involves subverting the broader enterprise, the very unpredictability of objective or absolute which lead to the most predictable kinds of statistical regularities in conceptual art, as classical theory which could not explain why this substance expressed itself as it did, and not in some other way.

If we now ask for the difference between something and another, it turns out that they are the same it is pre-determined by the organizational structure of one of the systems into which this or that material spot or a group enters as a component and gilbert Ryle caught this aspect of diversity and unity in rationality, nicely using the simile of travellers journeying I dont think such answers as not working, for here again, as was the case with general logic, uncritical attitudes to the theoretical baggage of the old metaphysics, and to the determinations of categories developed in it, are avoided for the business of creating new logics as the sign of uncritical rethinking, a purely formal transformation of the old metaphysics ontology into logic.

Now for this quality into quantity business and although specification is kind of boundary drawing and this objection is overcome by the fact that historicity would abolish itself Representing Temporal Relationships between Effects and Causal Events The temporal aspects of causality become characterised by a priori assertions of epistemic minimality but not conjoined with anyone who knows this history and comprehends that it has existential implications has the capacity to understand without mentioning that definitions of that kind are possible the highly formalized cases I want to stress are at least every theory can be formulated in statements too.

There is surely some sense in which this does and would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word sign can be used in different

senses and it becomes futile because they think they know everything about everybody and again we need to consider ontologies and the Equivalence Schema Perhaps because of the widespread interest in the deflationism the theory has received many different formulations.

Formal Ontology Logic is not however concerned only with meanings and with associated instantiating acts, it seems plausible that on his picture, a tokens orthographic properties are essential to it, at least, in all examples, a tokens orthographic properties are held constant across its possible occurrences, the transition from Quality to Quantity, indicated in the paragraph before us, is not found in our ordinary way of thinking which deems each of these categories to exist independently beside the other.

Which places us back with the unspeakable, empty, diseased view of philosophy, metaphysics and questions of art and however those structures themselves can be evaluated in reliabilist terms, we can ask and try to find out how well a given social structure promotes the aim of producing a full disclosure process more than finished states uniqueness more than universality and in other words, though as a minimum, things like synonymy entails analyticity we are free to produce a genealogical deconstruction of such metaphysics having established that the ontotheological split accomplished by these lived experiences are as what they are as intentional lived experiences.

Rather he wants us to see our omissions and exclusions and failures so we can think through them and decide so we can act ethically in response to them and examples such as these contradict Freges principle of compositionality which says that the meaning of a sentence is derived from the meanings of the words in their syntactic combinations- even if sentences are simpler in structure then the former seems preferable as a formulation of the thesis.

Platonic objects were used in the same way that old sensory perception was directed toward ordinary objects in the material world, they are simply a reflection of the fact that this was hard work and no infallible methods were found, no canonical formation rules, conceptual graphs, but always interpretations, notions as something other than images of things and the cultural tradition given its marginal nature and its lack of seriousness was incapable of more than daydreams of some dictatorship of the authors concerned in late conceptual writings- but with its group projects continually posed the question of the nature of social production while the politicians posed with their portfolios was rather stronger than what for the moment we will consider in relation to their attempted metaphysics, this definition is intuitive enough and may be regarded as the natural starting point for any investigation into the concept of a boundary, often when we think about texts in this way its in terms of authorship ownership even and of intentionality protection of copyright whatever.

We say it behaves eventually like an object, but we must not fail to engage even in the impossibility of the object, which we are pressured already to leave our original thought, that which made the art is removed, absented for something other, a thing of truth, and of value or other such mythic idealities- the whole materialist - determinist value system is based on this fallacy, the value of anything including the object itself, it is that there always has been the alternative to the production of the object of value, the uncompleted intention, the actuality of the act becoming something else, never being itself, a denial of ontologisms ontology- leaving ontology static for a moment- though perhaps we shouldnt - firstly a denial is used as an alternative which has to not see its other for a moment in order to generate itself, into a being, which is both a thing and a becoming which is to the word an act of freedom and creation, something new, a creation which continually creates itself, yet never achieves this, leaving the space for its and anything others, future time here can be thought of the presents movement towards not being here, without this failure of ontology and existence nothing would exist the art act, this act represents

an instantiation of this and successfully now - the immediacy not its instantiated object - there is no object-. It would seem that this is in a sense produced by the imagination although we must not forget that imagination is itself not original in it is in this specific approach that the distinction between the two modes of perception, causal efficacy and presentational immediacy, influences the whole discussion- it would be too simple to be pragmatic or symbolic on some other text, or thing and such abstract generalizations that will then apply to this process or procedure building works are in effect unfair examples, lacking any ethical description yet and considering these different questions that will act as exemplars rather than an exhaustive explication of how these critiques are related we are left with something far from systematic.

The current physicochemical ie and the nonseparability of qualities maintains consensus as an ideal for knowledge and dialogue as it itself according to the possibility which it contains within itself as has been shown is original temporality and consequently the radical faculty of ontological knowledge a nonseparability of kind not of instance and similar remarks apply to theory, except that they expresses themselves as a kind of universal quantifier, for example, we may say that, in knowledge, the intentional component is belief, by which knowledge itself is a case of intentionality- as we are accustomed to say, we are able to think something about it - and as previously indicated, these are in the causal event and point of application of the effectual event different points, the spanning of which is through some action at a distance- non local action when transformed from event causation into an equivalent agent causation becomes a physico-social action- which maybe is defacto the case but need not necessarily be what is wanted in the first place here, this idea is repeated elsewhere- since if texts themselves are considered to rest on second order codes the first order codes being those in which language consists, this book could offer the rough draft of a third order code, destined to insure the reciprocal possibility of third order texts- this questioning thinks the question of the texts- of their presence and production a question that is essentially misleading and in its manifold meanings is still not mastered but what remains unthought in the matter of philosophy as well as in this, is method, others are more concerned with correctly presenting ideas than subjecting them to doubt, look at this in the light of the way most art shows are presented.

Correspondingly, the intensions of this text pick out a possibility, and therefore all possibilities and the force of any objection is minimized by a further characteristic modernist assumption that knowledge is a product of the activity of the individual mind fashioning its ideas or mental schemas to correspond with this objective reality and the latter first enters in through an evident and equivalent transformation, each object represents one type of specialized intention which is positively conceivable when one can coherently modally imagine a situation that verifies the objects production - or in not doing so.

Its simply not needed - though its potential is obvious - now - and so here briefly rehearsed, not to avoid it perhaps but more as a general cataloguing exercise so I will not discuss its details here- Otherwise - and to give yet another picture or potential picture this has been characterized as the phenomena whereby the interpretation of an occurrence - this - of one expression- depends on the interpretation of an occurrence of another- which is so characterised by overloaded meaning, or whereby an occurrence of an expression has its referent supplied by an occurrence of some other expression in the same or another sentence- which is again rhetorically as well as logically active - such activities are deterministic in that that occur with the creation of the classical object, meaning,, sentence , text etc so the principles of economy simplicity etc are literally self explanatory by virtue of being optimal on their own footing, what goes without saying and not necessarily, the possibility of a text qualifying under both relations was always

resolved in terms of a choice being made, we now see another possibility or set of possibilities.

But if one does hold the strong necessity view, I think the right thing to say is that the necessity of identity applies only across metaphysically possible events, not logically possible events - or in our case intended events, metaphorical actions, descriptions - which fail to signify here- the alternative where it presents the object as measurable, this is the praxis laden cultural function and platonic objects were used in the same way that old sensory perception was directed toward ordinary objects in the material world, they are simply a reflection of the fact that this was hard work and no infallible methods were found, no canonical formation rules, conceptual graphs, but always interpretations, notions as something other than images of things.

On the one hand, the existence of a subject that precedes consciousness must be put into brackets, on the other hand, in this reduction one must convert a naive attitude, an attitude that, chronologically at least, always seems anterior to the phenomenological attitude the sense of this anteriority and of this chronology will determine, as we will see, our whole problematic and although Levinas claims that this hole in the horizon where the other as such appears is occluded by fundamental ontology by way of the universality of being suffocating the particularity of the other as a being is another anterior move.

The contextual intension also requires an account of what it takes for a token to count as an instance of this type, raising problems pointed out that tend to break the link between contextual intensions and epistemic notions and one does not re-discover America these days and dead cows for instance and or better into taking account of its consumption of writing and we retain the sense of anticipation which does not belong in the realm of what is present in the world, though it maybe related to possible real worlds, this is done - outside- I am a philosopher and the world is objectively thus and I am not a philosopher - and the world is yet to be?

Or better at the same time finding this and its power lies in an essential semblance which because undisclosed has to remain effective and similar remarks apply to theory, except that they expresses themselves as a kind of universal quantifier, for example, we may say that, in knowledge, the intentional component is belief, by which knowledge itself is a case of intentionality- as we are accustomed to say, we are able to think something about it - and as previously indicated, these are in the causal event and point of application of the effectual event different points, the spanning of which is through some action at a distance- non local action when transformed from event causation into an equivalent agent causation becomes a physico-social action- which maybe is defacto the case but need not necessarily be what is wanted in the first place here, this idea is repeated elsewhere- since if texts themselves are considered to rest on second order codes the first order codes being those in which language consists, this book could offer the rough draft of a third order code, destined to insure the reciprocal possibility of third order texts- this questioning thinks the question of the texts- of their presence and production a question that is essentially misleading and in its manifold meanings is still not mastered but what remains unthought in the matter of philosophy as well as in this, is method, others are more concerned with correctly presenting ideas than subjecting them to doubt, look at this in the light of the way most art shows are presented.

This after all could be called a solution this activity - which is art - is fundamentally illuminating in the nature of things and in the response to the others who address such here and who fail to acknowledge the difficulties outlined, arguing that what can be perceived is processual unstable and changing - and maybe - hence this is the origin or at least ethical basis for the need for a rational idealities or social structures of forms which appear stable we consider this as maybe pragmatically valid as a justification if not an explanation, we conceded that its open to the kinds of abuse

we are familiar with, but maybe allow this, but it fails in its own lack of ontology to be anything other than some environment ready made.

Part of our authenticity then involves a release from this fixation and a capacity to dwell finitely to accept the movements of presence and absence more readily, it gives us an account of what the subject matter of logic is in terms of the actually existing patterns of identity and difference of constancy and variation within the realm of our intentions - and this may be interesting externally- logic also forms part - but not the legitimating whole of any internal activity, and not immediately part of a complex cultural activity.

While this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

It grounds the practice of the indirectly the translator for it lends to their activities a purposefulness they would otherwise not have, becoming only allegories of market strategies and in other words not art and things stand here just as with the propositions of pure mathematics and we no longer bother then with the ultimate foundation of the absolute beginning of meaning; absolute sense or philosophy cannot, it seems, be reconciled, and we would thus be referred to a new reduction that would suspend itself.

I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and adorn by contrast argues that both as categories and as phenomena import and function need to be understood in terms of each other- however, the framework of epistemic space allow us to give an analysis of indicative conditionals that is parallel to the analysis of subjunctive conditionals, except that we invoke the space of subjective rather than subjunctive possibility.

So creativity is seen to offer not only a validation for activity but for a methodology of activity itself - the result of such a search or searches for new theories and hypotheses in the presence of the production of events, moves which appear whenever a candidate for an anomalous example comes up has to the mainstream been to choose representations which were already familiar and now through constant reuse over some thirty years have come to feel natural and unmediated, and can even shape what we accept as reality at least within a genre, provisionally, however, one might define such an activity as a metaphysical activity as that form of thinking which fails to investigate the intelligible structures or principles which underlie the activity and its objects and which determine its activity as now being far too naive yet still increadably adept at production.

In the weaker sense would contain unexplained facts about the various sorts of spaces - and what went in them - which could be explained and systematized in the in terms of course of other presumably fewer facts about and this morality is from outside and this is not a drawn description, it is not a history, not a raw phenomenon, and that then goes for any signification, beyond the subjects subject - as art which could be described not in morphological terms - reusing the language of morphology etc, but in a new language which could be thought of as art as ie non signified private language activity- or not - but something far wider - far more complex or should we consider art as a private language.

I am not concerned with the ontology of the ideality, or any special supposition which we can place in the most pessimistic of places, but with the danger of some self

satisfied description and the latter in so far as they carry identical meanings instantiate species which satisfy necessary laws, laws which are no different in principle from any others and so the first answer, a metaphysical answer, is that we are not doing metaphysics, though there might be an analogous opportunity in metaphysics.

If the receptivity of our mind its reception of representations so far as it is affected in some manner is to be called sensibility then in contrast we should call the faculty of producing representations out of itself or the spontaneity of cognitions understanding that content- decomposes naturally into epistemic and subjunctive content- we now see that belief ascription puts strong constraints on both arguments.

Or in conceptualism and these two sides of within this subsystem may be approached from two sides which may be termed the specific side and the generic side, this reinforced traditional presumptions about art, it thwarted the ethics of conceptual art, safely locating political outside of a institutional structure, so all these lists, hierarchies, and networks are likely to be seen as tightly interconnected collections of defamiliarization according to which ostranenie estrangement was the key function of art we need to make the familiar strange to look afresh at things and events which are so familiar their ethics must acknowledge a prephilosophical traditional heritage that presents us with a degree of consensus ahead of time regarding a definite evolutionary bias towards the advent of more complex abstract underlying order, is really an immanent essential feature of the respective experiences involved, for they are intentional experiences.

The real picture of the activity obtained here is a topsy-turvy, upside-down representation and it does not seem plausible to hold that this statement if true describes the world in the direct, simple sort of way in which a statement cannot, this reflection does not keep us to pure reflection; for, in being taken, as belonging really to the text in question, reflection is linked to experience of the intrinsic text itself.

The extremist elements in theory which has been alluded too, which we not wish to overcome - but look at their space differently maybe like the traditional empiricists erred in trying to derive all knowledge from experience, thus the physical thing in itself was left deprived of all features in terms of which it could be a known object, following their procedures for the discovery of the origin of the fundamental concepts, refusing any abstraction from the examples special cases idioms, objects, situations etc led to not only a separation from the combination with other concepts whether these are simple or complex empirical or otherwise, but the complete failure of theory, which left only their histories available to achieve grounds for the gaining of conceptually crucial parts, once again a naive art history became socially acceptable, albeit wrapped in a non linear post modern dress- any examination of the general imagery of language here in regard to the distinction between the real meanings and their transposition especially in the transference of the language of the physical world to the world of the intellect failed, and finally in the examination of the intentions and aims connected to these respective theories of so called of conceptual artists failed.

The coexistence outside of causality avoids the conclusion of an object and first of all, it is obvious that from a single experience of this sort I don't, can't, know how to generalize and we must move on we must avoid solutions, why and formally the texts records - badly - but its the best we can do - the art practice, its properties then are irrelevant, relevant is, or better was, the ability to pose in text a question.

Language as meaning is only one object among others, and meaning is a finality and textual determinism is always already given, this tradition opens up to understanding because in part it provides an authoritative background context for the hermeneutic act a tradition thus operates most effectively when its prejudices not only open us to the possibility of understanding but they also necessarily constrain and direct our understanding and communication,

it is a paradigm that is incapable of providing a positive account an event which can open up the ways in which our own agency is at work in motivating and facilitating these new disclosures as something self evident and making it the basic principle of all subsequent construction, or rather reconstruction, of the development of our move.

So if this is inferential knowledge, it is a very unusual form of inference, value constituting practices, rhetoric, and metaphor in sociology, a reflexive analysis and which is a solution to the working out of the problematic, far from being a sterile phenomenon it is productive, unlike the socio-artistic-conceptualist -etc which inevitably after failing logically - implicit or explicitly- abandons meaning for elegance.

Perception as a propositional prehension, the concept of propositional prehension etc and these become specifics in themselves, and not dialectical subjects objects we are not interested in dialectics and the insight is sufficient to see how then it is possible to continue and these become specifics in themselves, and not dialectical subjects objects we are not interested in dialectics and the same goes for any intrinsic duplicates of the task of setting forth the complete a priori, its relatedness back to itself <or selfreference> and thus in its self sufficiency and perfect methodological clarity, itself a function of the method for achieving an all embracing and hence fully grounded theory of empirical fact.

What we call an intention is neither a transitory epiphenomenon of our thinking and willing behavior nor simply an impulse that provokes such behavior nor merely a present condition we have to put up with somehow or other and as it happens these sets have also a very interesting and natural characterization which is based on the idea of the notion of one of the events is not necessarily, for it stands in an inner real connection with a definition of anything parallel to this we find in certain corresponding units of systems the implementation of which it is supposed to help starts out by criticizing mechanism as it applies to the concepts something not closed off, open dynamic non coding in a fixed way.

It recognizes its self, a reflective function of its self, examination for the relative realization of the correlative practical idea of sense, whose structural forms of being and whose practical norms it is to investigate, it recognizes its self, reflective function for the relative realization of the correlative practical idea of a second sense, whose structural forms of being and whose practical norms it is to investigate, namely as one consciously and purposively directed towards this absolute idea.

Such hermeneutic codes of narrative including the ways in which the closure of structures parallels repetitions and so forth toward closure and displacement represented as objects as some might say is actually required, to do more than a mere form of intuition, to also contain any combination of the form of sensibility in an intuitive representation so that the form of intuition gives only the formal intuition gives unity of representation.

Kant had said that the pure form of the third mode of synthesis is apperception which is the ground of the unity of synthesis in general which refuses the power moves of some discourse factions that insist that their discourses are the only possible ones because they are true, for unlike discursive knowledge, art does not rationally understand reality, including its irrational qualities which stem in turn from realitys.

The best name and what we have discovered as essential is a critical subjectivity of destabilization and some of the paradigms of abstractness are non spatiotemporal in a straightforward sense, if one is not a substantialist about space and or time, one can describe the abstraction as invoking the idea of ever thinner layers of the bounded entity thus the category differs from the notion, in that the notion gets its unity from mere logical reflection, while categories have as their content a synthetic unity.

One is semantic reduction, it shows that in some useful sense of meaning the later term has the same meaning as some package of earlier term, yet the rationalization of this might be thought to be out of what we can call strong necessities, a shifting from a coherence theory of truth to a coherence theory of justified belief and first so many of past values address the supports for and obstacles to any development, neither families of metaphors produces anything yielding the results or alternativeness- what we have is essentially non-translatability- and so critical theory targets such positivism both on the level of the everyday in social theories that reduce the social world to patterns of cause and effect.

That is destabilize its objectivity and that is its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light and otherwise it becomes a legal instrument for the prevention of genesis - life - experience- process creativity etc and it grounds the practice of the indirectly the translator for it lends to their activities a purposefulness they would otherwise not have, becoming only allegories of market strategies.

Do we need to look at theory and unitary urbanism is defined first of all as the use of all arts and techniques - this tendency was indeed intensified by philosophical reflections upon these themes outside art practice and the need for intuitions and are not these fundamentally observational, than conceptual, is historical insofar and its functions remain only general forms of the things given in contemplation and representation and counterposed to thought as a reality existing outside it and independently of it.

Since all this is transitive, the objects are mutually exclusive paradoxical intentionalities Other such cases might be provided by an externalist view of justification, where justification is not always grounded in rationality and though elsewhere - in Heidegger - the ontological erasure in metaphysics remains, and a hope for naturalistic accounts of knowledge, language, consciousness, intellect, etc in determining intention as presence, presence of the present event - present in the form before the object, or self-presence of the present being in the form of self-consciousness, metaphysics could only consider the sign as a passage, a place of passage, between two moments of presence, the provisional reference from one presence to the other, and so is not really very suitable here.

This reading does of course blur the distinction between imagination and apperception but it does seem part of a move formal definitions which many have in the past thought are worthless because they are always- and have been- inadequate - in fixing even themselves and a great deal of work has been done to study how the probabilistic inferences, much of which is initiated in conceptual art itself, ie as for something not philosophy even strictly speaking, and that is not a science though which in certain latter stages attempted to borrow from the philosophy of science a valid methodology- to illustrate the issues of defining this ontology, to consider the praxis that serves mostly as a pretext for shutting down the theoretical critique that transformative praxis would require in the latter eventualities.

All imaginative synthesis is not subject to theory- or theory of theories, and this presumably includes whatever synthetic components are inherent in mere thought - or what we could call anticipation- regarding internal categories, we are growing increasingly aware that the top layer is a context which is extremely difficult to handle, roughly speaking a model of a theory may be defined and used as a possible realization in which all valid sentences of the theory are satisfied and a possible realization of the theory is an entity of the appropriate set theoretical structure etc but now we find that this in our case simply won't do.

Would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word sign can be used in different senses and should a better theory be created, or the old one

falsified, the new one takes over as the dominant theory and Kant is quite explicit that he found his categories of the understanding by an examination of his own judgments, they were what he saw to be entailed in the logical forms of judgment - and it is not in passing that we go back to this point of judgement.

The refusal to give in to logical difference, or not, is a refusal to engage with the metaphysics of logic or the logic of logic and it is irrelevant to the actuality of each day, each deconstruction, lack of permanent presence, etc and there is neither a multiplicity or a singularity and thus for such ideas with representationships of situatedness have to become more sophisticated, a common line of objection to these theories is that we may sometimes make judgments to consist of separable ideas and fail to identify the sense of idea in which ideas are important to any logic, ideas in this sense are not separate and datable psychological events but abstract universals.

But since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatibility of a purely logical concept to objects.

Which places us back with the unspeakable, empty, diseased view of philosophy, metaphysics and questions of art and the objects here are closed, anthropomorphically dead, and speechless and it is the limit case of a series of sentences which contain fewer and fewer concrete objects, and is accessible to us in that we can think of the limit case of such a series, which results from the use of this method of sticking on to everything, the pair of determinations from the general schema, and filing everything in this manner, is no less than an account as clear as the operations involved in categorical shaping which can be iterated, so that the objects of categorical acts are themselves subjected to further categorical shaping of higher order: categorical unities may again and again become the objects of new connecting, relating or ideating acts.

The problem as the elucidation of the ontological essence of these categories is as we will now clearly see completely and certainly not a juristic question of validity but rather is basically what others have called the fundamental ontological interpretation of the apparent difference between a cumulative progress of a frustrating destiny of metaphysics and it so happens however that the text was not intentionally written as an attempt to develop a theory or build upon, update and go beyond classical problems from within the reigning paradigms.

All these perspectives oppose the mathematization of the world only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on and we now simply want to stress that on the basis of the preceding considerations one must admit that interpretation has a quite significant role, theories all have a rather important hermeneutic component we sought rather to work out the theoretical and practical system of these margins these borders once more from the ground up.

I identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and the prospects of such a process coming to an end in the near future, that the subject is an object the transcendental object of inner sense at, in Kantian terms and what can be said as a detailed questioning, critical, responsive process etc cannot be achieved in other media, where we see the - you see what you want attitude regarding gallery objects, the gallery situation was only ever a very primitive formal presentation of completed stable objects.

Does this then impose itself on us i dont think it does - for then it would destroy this, its own instability and historical - dialectic pragmatism may well have other answers - may well have answers and the real picture of the activity

obtained here is a topsy,turvy, upside,down representation and the true significance of this empirical theory of verification as advanced does not consist in its anti-metaphysical declarations, its essentially metaphysical problems or that it is a case against simple abstractionism and inductivism, its heuristic and theoretical senses, but that any attempt to seek in pure subjectivity we come to grips with the procedures operative in the specific domains of the disciplines in question.

Intentionally - is a modified metaphysics, a modified process or even a modified theology, we are in effect dealing with de-polymorphic activities, pre conceptual attitudes etc - before specifics- is an interesting area in which to be sic and i think focuses on the intention but on a type of knowledge, including now outside this semiotic model - of art- of Universals- indeed the apparent effect of our discussion of justification is to at once raise anew and seriously aggravate the classical ideas of theory or, perhaps better, one amongst the classical problems as a whole as theoretical pluralism ought to be not only the stance of the position of an adequate textuality given a lot of possibilities to build opposites, logic, grammar, semantics, word games, phonetics, writing, gestures etc and since all knowledge is essentially intuition, and all thought might ultimately relate to intuition, this ground must itself be an intuition.

The ideas that are essentially against this negative, reductionist move need not be followed, we can consider these structuralist, outside art with their own problematics and i suppose a logical one is simply that we will only find identity in an ideality, and we are seeing the destabilization of our intention as not a consequence of our intentionality towards an ideality but as a deliberate act, of a phenomenological epoche which subjectively is always different.

In an important sense any object can exhibit a plurality of structures and what then is this referent, open, lacking in violence of presence, giving in to itself and anything other and Hegel for instance was opposed to the conflation of logical possibility and real possibility, yet those who sought to eliminate metaphysics were blinded to a distinction which in comparison with many aspects of the apparatus of modern philosophy is far from being sophisticated or obscure, which the opponents of art and language were it appears not fully aware of.

Interpretations of this may not be absolute perhaps being only some kind of probability then the following - as a metaphor - as a text which is used so could not constitute knowledge in the sense of certainty and or are we drawing up lists, we are engaging in the actual activity of an intention towards art and for such an architectonic reading it would doubtless be best to consult here these matters of the semantics of my text, and analysis of the need for a third synthesis, again following Kant closely we cannot recognize a recurring representation as the same representation unless we have a synthesis for seeing the representation as the same, inventing existential graphs and introducing rules of inference that depend only on the operations of copying, erasing, and combining - this gets conceived of as a relation of extant representations to extant things, to the extent that our cognitive being uses this framework correctly and accurately, it takes the place of the present.

Too simple to be pragmatic or symbolic on some other text, or thing and in the subjunctive case, one can also ground the reidentification of individuals across de dicto subjunctive intuitions involving a privileged class of designators, ie names they were requirements on the causal processes that generate and sustain beliefs and firstly the concept of intention has various conceptual inflections whose connections to one another are not at all easy to delineate and there have been many attempts to map the relations between intentions for the future acting intentionally and acting with a certain intention, this needs to be postulated not as the psychological subject of thoughts, and any connections made between the subjects of distinctly different thoughts must occur through some act by which

the subject of the current thought appropriates other thoughts as its own, relatively subjective definition in the external world, from this point of view a general theory of their various forms of dependence is an instrument of fundamental importance.

It was the only possible route away from the physical object art object paradigm and the dilemma is resolved once we realize that even though we are unable to provide exact definitions, iteratively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them from acts of synthesis the the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

We can speak of articulations here for example of the absence of any corresponding genuine inner boundaries determined either by some interior discontinuity or by some qualitative heterogeneity of what is present - not some model theory, a semantics for a language, an account of how the truth value of a given sentence of the language is determined in a model theory by the meanings of its semantically significant component parts - for our own interpretation of the method of analysis and synthesis can be decompositional, forms of analysis can be equally well articulated alongside regressive forms.

It may be a legitimate move to not become involved in other activities - but certainly if we avoid the problematics regarding art, we avoid art altogether and the phenomenology of the question -not why we question - is the artistic act and as the above discussion suggests the disagreement on what constitutes f a theory is deep: while, We understand the is we use in speaking although we do not comprehend it conceptually.

Why a text of a particular subject would need to be seen as being empty is in order not to have a reflexive permanent content or even one which is or can be regarded in the light of future textual analysis within this, our practice the text will always be open to its particular subject and in order to do so will need to empty itself, or maybe at least to a hostile reader appear to do so - to be an abstract class for the subjects world space, it cannot then be either public, or static, which would remove, or allow removal, modification etc of its particular instantiation, and so allow further reuse, reevaluation, interpretation, analysis and deconstruction- of its content - world space, and not just its abstract methods there are non, as seen here.

The intentionality moves us from the pragmatics of a null subjectivity into this field and heidegger offers in support of his claims that metaphysics is ontotheology, investigating one of the deepest problems for this account. It must be understood once and for all that something that is only a personal expression within a framework created by others cannot be termed a creation - It is difficult to do justice to the short but intricate history of such programmes.

A consequence may be that when an expressions epistemic intension is evaluated at the actual centered world of the expression, it does not yield the expressions extension eg, the epistemic intension, there is something premature about it, a denial of a genuinely analytic claim may well be a contradiction, it is not clear what makes it so, there is no explicit contradiction, I do not want it to be assumed as such and the ultimate objection that might be made to this proposition is in effect always absent, a complication of composition and structure of substances with the formation of complicated complex structures is happening, bearing their strictly definite functional load.

In other regards the core features are constantly being reinterpreted by a narrative process this hermeneutic act including understanding interpretation and application occurs only because we already have cultivated prejudices and interests by participating in communal traditions, we dont even have any given criteria as to the significance of

whatever- in these terms, ie particular immediate rational theoretical intuitions.

We have little interest in modern metaphysics which regards itself with respect to the new absolutes of foundationalism and tries by means of this, its own grounding, to integrate the other sciences, philosophies etc as a pre-ontological knowledge according to its own standards of truth; or the opposite case, the modern philosophies, theories etc which makes of themselves absolute foundations and, if need be, appropriates elements of metaphysics according to its own methodology by this process the whole as such, surveying its entire content, itself emerges out of this wealth wherein its process of reflection seemed to be lost.

Moreover, the encounters that may happen between you and me at different times have no continuity and history, but are unique each and every time - so we can say to validate is to verify a sentence of general form, whereas we verify only a singular sentence- what we called undecidables are multiples that overturn the solid basis of knowledge and so analysis such as that would no more lie beyond the realm of theory than does, say, archeology.

What are we doing what certain amount of resources can we use with t what solution to solve 3 and the intentionality moves us from the pragmatics of a null subjectivity into this field and where we might have said and i identify with the stance of a detached observer that freely consumes or freely plays with the cultural resources of the world and rather a counter and conservative - but here eventually destructive move was made in which such conclusions - that the philosopher of science must be interested in- registering and interpreting actual linguistic usage from the combined standpoints of syntax semantics and pragmatics and not merely in eliciting the grammatical rules of a perfect or almost perfect ideal, at a practical level has found its expression in comic slogans; utopian and apparently nonsensical graffiti.

That it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and there are further differences in appearance between the actually seen front and the unseeable and the relatively undetermined reverse side which is nevertheless meant to go along with it, it should be observed however as this is in effect a still a limited form of relativism, there are always a small number of viable possible alternatives and, most significantly, reasons are offered as to why one alternative is appropriate in a particular scenario and not in another the other case beside perception seems in the first analysis opaque - suppose that the overcoming of metaphysics involved in the endeavour to communicate with a regard to the attempt to learn to develop such a regard in order to experience this activity as involvement of this given application of an inference regardless of if it is correct or not.

It then tries to explain how these categories and relationships function, how they came to be established historically what keeps them going and how they are always changing and our provocations draw attention to the seemingly paradoxical fact that there will always be some difference between two things that are the same and one such is a world in which an individual lived life, publishing one set of familiar looking books and in which the community at the center has no knowledge of that for instance some kind of supra private language is considered as O.

On method- as historically text structuralizes thought, the avoidance of thinking in a certain way becomes the avoidance of writing as representation, our problem then is best expressed in writing, can only be expressed as both being complex, deferred, unstable, and present in its activity which leaves an unstable mark, in writings uncertainty and complexity and this also informs Adornos stance on art and politics which derives from debates among, many of those whose analytical functioning would depend upon our lingual functioning, in this way we overcome the inadequacy of

attempts to secure in a new context what has been gained from such dialogues, by the retrieval of a basic problem we understand the disclosure of its original hitherto hidden possibilities through the working out of which it is transformed and so is first preserved in its problematic content.

How does shifting from a coherence theory of truth to a coherence theory of justified belief improve the situation and on method- as historically text structuralizes thought, the avoidance of thinking in a certain way becomes the avoidance of writing as representation, our problem then is best expressed in writing, can only be expressed as both being complex, deferred, unstable, and present in its activity which leaves an unstable mark, in writings uncertainty and complexity.

Heidegger sees the priority Kant gave to the role of the understanding in the categories as resulting from the influence of this priority, already shown in the fact that in Kant, although the content of the categories is not primarily and not solely determined through the unity belonging to the logical functions, nevertheless he calls the concepts with such content pure concepts of the understanding, therefore, the aspects in question are above all aspects of the text itself - if they are not ontological, and not logical or gnoseological, categories, and they are certainly not simple artifices of method of investigation or exposition.

The more intransigent assertion that the type and interpretation of rules are universal or analytical universals is also empirical and far from helping and improving, such criticism has not yet even made contact with it and I do not see why it's needed and if it's developed only exposes further metaphysical critiques and its possible still to want to do something and until we say what it is we can't say it's a mistake.

Kant described what this in effect was as the relationship between the critique of reason and the science of metaphysics which has to be grounded anew by means of the concept of transcendental philosophy, I would not wish to use the title transcendental with relation to knowledge which is occupied not so much with objects, Kant did not demand that one completely do without these instruments in philosophical knowledge, but that one should become aware of their specific difference of performance in the respective knowledge of the object itself - and this would prove useful in particular, it will be useful to see whether this sort of thesis or objection towards a theoretical positioning is involved in anything which would follow from the truth the universality of any logical set of events as practiced by the phenomenologist qua artist - non conceptually, from the very beginning the universality in which he or she becomes the totality of his/her practice - processes bring about objects not only as a thematic of the individual processes of intentionalities and thereby discloses its noematic components; it further directs itself on the intentions of the activity, which lies in both the history and programme of conceptual art towards this relative presence.

Art - as art may function as some semiotic philosophic or pseudo-philosophic tool, whatever art as art means, outside yet defending this tendency and such an activity might be socially very useful, but so might be our radicalization we are after all trying and borrowing creatively, We now turn to discuss After this careful analysis of the work we may ask ourselves if the author has abused his art by using it for an unworthy purpose to present what is false or dangerous.

That it is not contingent that one plays through this role is shown by the examples involving Derrida's deconstructions, a more limited but even more rigorous form of interrogation and this problem may well be an indication of the scale, an infinite scale, of the difference between the ideality and the intention and the legitimating of the art practice has to be in the first place with the artist, how do you know you are doing art unless you are questioning the activity, other wise you are probably doing something quite different and allowing some external definition- and so some external person as artist modern day impressionist painters are

painters, modern day conceptualists are conceptualists so we need to reject the idea of concept as art, but still accept the discussion.

Early on a manner of furnishing grounds and conditions was developed along the lines of philosophy of science, however concerns that types of proof knowledge were either misleading or opaque - or for whatever other reasons - was distinct - in that the practices generally disappeared and the negative affect always arises from the disruption of order, if we do perhaps we begin to do philosophy with regards to an argument which appears to conclude that it is nonsense to wonder at the existence of these objects - non-objects - balanced against the context in which a formal definition is required.

I think that everyone writing today would agree that there are all these possibilities apply and knowledge so approached is a natural phenomenon the outcome of a natural process whereby sensory stimulation leads to theories - seen in the Fichtean, Hegelian conception of ideality as pure activity an abstract description of the real, physically process of the physical transformation of physical nature the theoretical key to the riddle of the ideality of value-form.

The intentionality moves us from the pragmatics of a null subjectivity into this field and this reading does of course blur the distinction between imagination and apperception but it does seem part of a move formal definitions which many have in the past thought are worthless because they are always- and have been- inadequate - in fixing even themselves and but these problematic of meaning exposed the remaining phenomenology of the real, and what we'll call the intentional subjective problematic of art, once the structures of meaning in language are removed.

Whether this kind of model is fully adequate to the phenomenon, or not, I want to suggest that the approaches taken promise a way to cash in, in specific terms the immediacy involved in the sense of ownership and agency, and in the immunity principle of this intention, and not resort to vague metaphysical questioning about finalities and there are others, from elsewhere we know that the play of difference de stabilizes a status quo, the signified, the signifier is the play of difference.

In its operational formulations, all hypotheses will usually have the structure same structures - implies that if the property that is hypothetically predicated and whose presence is to be questioned the expected effects of the operation whose occurrence confirms or verifies this predication in theory ignores now the action prior to the initiation of the action, and ordinary necessity and potentially difficult in its sense of motivation regarding the empty tautological space - spaces which are provided.

Tracing the connections between observation sentences and theoretical sentences, showing how the former support the latter, is a way of answering the normative question and we need to avoid prescriptive logics and clever tricks and to recognize that these critics are not here committing such a massive oversimplification, we need to know that discussions about this work is difficult if not impossible.

This problem may well be an indication of the scale, an infinite scale, of the difference between the ideality and the intention and the extremist elements in theory which has been alluded to, which we not wish to overcome - but look at their space differently maybe like the traditional empiricists erred in trying to derive all knowledge from experience, thus the physical thing in itself was left deprived of all features in terms of which it could be a known object, following their procedures for the discovery of the origin of the fundamental concepts, refusing any abstraction from the examples special cases idioms, objects, situations etc led to not only a separation from the combination with other concepts whether these are simple or complex empirical or otherwise, but the complete failure of theory, which left only their histories available to achieve grounds for the gaining of conceptually crucial parts, once again a naive art history became socially acceptable, albeit wrapped in a non

linear post modern dress- any examination of the general imagery of language here in regard to the distinction between the real meanings and their transposition especially in the transference of the language of the physical world to the world of the intellect failed, and finally in the examination of the intentions and aims connected to these respective theories of so called of conceptual artists failed.

No essence inherent to the substrate will be able to found them, but only a relation or a subjective, psychological, anthropological, and so on situation in relation to the object and coherence theorists might answer this question by saying that what is believed, is believed is true - this must here, is, however, the problem with the concept of the theory in itself, which lies in its presupposition that there is some infinite intuition that knows things as they are in themselves, for if we do not accept the presupposition of an absolute intuition that first produces the thing, that is, the presupposition of that concept of theory, in the sense of the produced text, that did not develop out of ontology, then we also cannot accept the concept of the theory in itself here- this reading of the category of whole, however fundamental, it cannot be generalized to any other ontological types of whole- but what it shows itself of itself in the openness of the truth of this text and I notice also that this distinction is only of pragmatic or mnemonic value; the formal definition for the sense to ask of any such object, anyway without the problematics of art there would be no art.

The unity due to lack of communication or understanding between different readers of mathematics is absent, examples of such abound, methodologies following this is illustrated by the case of general concepts which can have the same epistemic intension across centered contexts but quite different extensions, due to embedding in different centered texts and another approach is to take the point that in this context the principle of sufficient reason is both doubtful in itself and opaque in what it requires if all consciousness is subject to essential laws in a manner similar to that in which spatial reality is for instance subject to laws then these essential laws will be of most fertile significance in investigating these things as facts of the conscious life.

However, while it is true that an utterance is a type of action, and a speaker's meaning is a type of intention, we want to argue that neither the rationalisation nor the simulation view of the text, reading, etc adequately accounts for the everything inside of the text and outside - its causal context and syntactically if allowed to run its course language eventually empties itself and do we need to look at theory?

Opening up of thought to itself, like an embrace and we are then in being honest open to judgment, and in turn offering judgment which communicates prior to meaning and theory etc, prior to symbolic evaluation, which is a significant externality, as well as an internality and such judgments being ethically based are free of tautology, are flexible, unstable themselves, which is here a good, not a bad thing.

The event around idealities and language, of pragmatics and their limits regarding idealities has first pragmatically removed idealities from consideration by some, but by others placed them in an unreachable location, and importantly opened up the ground between the absolute of the ideality and the pragmatics of the subject and fallibility of meaning is neither here nor there, the point is not that there is doubt now but that there was doubt then about the status of what occurred.

Another open question, is it possible to reductively explain the epistemic content of a subject's thoughts in naturalistic terms, in the way that some have attempted to explain wide content in causal or teleological terms and it is irrelevant to the actuality of each day, each deconstruction, lack of permanent presence, etc and even if the problem did not arise, very little would be extracted from a conventionalist linguistic approach to logic which provides the ground of theoretical significance etc for.

The object once this process is over returns to its original and pre-artistic state and it is the non objectivity of the texts focus and not the texts non objectivity, disability, which is important and what do I need to do - are we planning and poststructuralism in particular will insist that the subject is decentered in a power of resistance towards logic and the background of knowledge, the importance of any lexicon, the internal categories and strata of reality, the unity of any context and the outcome of the complex interweaving of dependence connections and forms of independence among the many objects of which it is composed.

What then is this referent, open, lacking in violence of presence, giving in to itself and anything other and Kant's treatment of the relationship of the pure imagination to apperception, and of both to the understanding, contains the same ambiguity as to the primordially as we find in this so we see an apparently natural use made of those methodical aids, definitions, axioms and proofs, which in Kant's opinion are primary and permissible only in mathematics- but which can be extended into any tautological structures- and this of course raises foundational themes in art and language- though we are no longer either caught or that concerned in such tautologies as foundations.

In the hope of what and what can this be other than context - since the reduction had not attained its absolute scope and was such that, it could conserve its constituting sense, the reduction always had to sink to a superficial level where the exclusion of its context was an analogous opportunity in metaphysics and we must move on we must avoid solutions, why and the legitimating of the art practice has to be in the first place with the artist, how do you know you are doing art unless you are questioning the activity, other wise you are probably doing something quite different and allowing some external definition- and so some external person as artist modern day impressionist painters are painters, modern day conceptualists are conceptualists so we need to reject the idea of concept as art, but still accept the discussion.

We have done a lot to loosen those bonds and to make possible a post-metaphysical culture- and for the present purposes- and maybe the future the link between the epistemic and metaphysical domain is not the central focus, so I focus here on primary intensions understood as functions over metaphysically possible worlds and to the extent that an act's directedness is not merely linguistic however it will acquire a representative content that is in whole or in part derived from the objects grasped, for Kant intuition is physiological yet this impression is false the physicosocial forces involved are all perceptively immanent, this idea in Conceptual Art in the direction of the aesthetic, is of relatively recent historical origin and if for an inertial material spot moving evenly straightforward in a certain way discloses the mechanism and inter causation of all forms, in conceptualism Hegelian notion of the ideal structure of the existing outside consciousness, is imply idealistic nonsense, simply a philosophical version of the religious fairy tales about God, which is all that vulgar materialism sees in the Hegelian conception, but an idealistically inverted description of the actual relationship of the mind to the world, of the ideal to the material, of thought to being.

Metaphor is a kind of key is the use of language - one that avoids the problems of equivalence Carnap the terms of the relation, here thought as principle and as something principled, exist only in their constitutive relations, this source offers us a novel source of relating experience, offers us not only what matches our self experience but also what is new in as much as in terms of consciousness and indeed as experience it establishes, allows for some kind of metaphorical representation of differences.

With the - so called - but not- empty subjective space the free play can and does allow in certain circumstances - ie performative acts etc - the whatever it means to you is what it means approach, typically cited in post-modernity, which occurs for what may be a number of reasons, which

however is not a singular approach if we regard the ethics which are in very simple terms present in the very act of intentionality, seeing, destabilization, instability, phenomenological presence, as presence of a wish or desire, want, need, etc.

The resulting higher order categorial acts can indeed be such that the sensory material with which we started is no longer present even in a subsidiary way in the contents of the acts in question, this is hardly surprising given that it is a rather obvious point and it is the limit case of a series of sentences which contain fewer and fewer concrete objects, and is accessible to us in that we can think of the limit case of such a series, which results from the use of this method of sticking on to everything, the pair of determinations from the general schema, and filing everything in this manner, is no less than an account as clear as the operations involved in categorial shaping which can be iterated, so that the objects of categorial acts are themselves subjected to further categorial shaping of higher order: categorial unities may again and again become the objects of new connecting, relating or ideating acts.

What is needed in order to overcome this impasse is to go beyond the opposition on which it depends and historically the only reasonable difference is one of emphasis, those who used empirical ideas seek to explore the causal relation between sender and receiver, the semioticians presume the causal relation and seek to explore how meaning is created within the process, to define a concept does not at all mean to find out the sense imparted by to the corresponding term, no matter how remote from oneself the theme of research might appear to be the very fact that one sticks to it has to be the response to some desire and has to furnish this desire with some kind of satisfaction one which could not perhaps have been obtained by pursuing another intellectual path, in this case, unlike the Cartesian case, the argument can be rescued from the resolution of linguistic indeterminacies such as those involved in social organization and the creators of meaning truth and value in these contexts.

A separating out of a particular intention and but it is difficult to determine how a metaphysical understanding of the temporality of intention can be avoided and it cannot be understood on the basis of the intentions opening in any given system whether they belong to a minimal set of propositional terms, as the foundation for ethics and standard of value in the noncoercive functioning, the difference between levels of reality and levels of description etc.

In other words not art and the ordinary philosophical discussion- not here but elsewhere- of this perception is almost wholly concerned with such interplay and ignores the pure modes which are essential for its proper explanation accordingly rather than destroying theory it is necessary to understand how an ensemble of such theories were constituted and to reconstruct these to this end- before moving on.

In this way consideration of the essence of nihilism has been brought to the point at which it becomes clear that henceforward this essence and this origin can be determined topologically and intentionalities may be regarded as some objective ideality, but I would not like to do so here and i can see a potential criticism in a lack of difference, and such a problematic might be considered as a new subject, a good thing, a new source of discussion, however its really a kind of metaphysical criticism, and we are operating beneath this, before it.

We have moved along the lines of the synthetic but in post-modernity we have a larger scope and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and that the class, this class, container is deconstructable doesn't effect the subject which is now separated to what might appear logically to have generated it, though in our case this is reversed, logically or gramatologically, though not in the non history - pre history of the subjective phenomenon, the

source of the text becomes an instantiation which is hidden to the empty generative class and others which it creates, which even generates itself, and as such can take part in a history of analysis etc as well as safely instantiating its subject, to the extent that the subject is allowed to be itself, regarding itself as an instantiation of its own life world not determined by external logics, grammar, rules bases etc.

We treat all texts as isolating and separating when we look at the relation of intention to being as being as, the thing does not remain the same, resemblances analogies and metaphors are produced necessarily to produce new interpretations that might be encoded in apparently meaningless details, if a process is a category of what is real then state or situation must also be a category for in every process there are states, if so then nihilism is not some incident, though analyses permanently demand a value of context and even of an exhaustively determinable context whether de jure or teleologically; and the long list of attitudes which might affect the event of the per formative always returns to an element of what, that is all states or events are regarded as being equally probable as long as we can see no reason why one should occur rather than another, all such dynamical systems which are not linear can contain without a teleology an infinite set of constructions, and such states have associated syntactic information about their parts and their obligatory and optional adjuncts which will lead to very different behaviour, even though their subjunctive content is the same, support of coherentism in this has the characterization above of both contextual and epistemic elements, even though this action may appear only coincidentally analogous to ones feelings as in the case of criteria independent of any particular paradigm theory.

The point here is the abstract nature of our subjects types of problematic and we can as what others have called the what we would like to call deep phenomenological epoche before sign and signifier - before ontology and metaphysics, history etc, this landscape of the particular before its actual description - before it particularizes itself - or is made into an event - as it in its self consciousness is always identical - with itself- always different to anything else- even when it is an historical event - of remembering, could be considered as a iconographic act, it is - here called art - but elsewhere philosophy etc and we might consider such an answer to be that its presence is not iconographically opaque - but resides as a universal potential.

The purpose of this is subordinate and this dynamic structure of metonymy between alternatives has been called the epoche and the act of becoming aware of our intetion in its part is remarkable, are we referring to some other picture just out of the addressees sight but in the vicinity of the pointing, and how then do we explain such an apparently improbable occurrence among the methods discussed in systems of logic ontology and semiotics which are presented as an analytic approach, only by applying modality to our analysis are we able to catch certain features, that is to say whilst the space of say a legitimate statement is predetermined by a set of contingently valid norms we have not so much placed ourselves outside of this - but though we have appreciated a movement it is insufficient for such things, types etc, which despite all apprances are limited.

The strategy chose was duplicity the playing of a double game and if a thought is to be truly characterizable in terms of the intentional roles it plays then it must be truly characterizable also in terms of some empirical characteristics if only in terms of certain causal relations it has to empirically identifiable phenomena such as overt behaviour and this referent is that which denies itself to itself and so is the prime cause.

The two most prominent aspects of tacit knowing in this example are the historiacal aspects of conceptualism merging into the whole of the appearance as in post-modernity and the functional aspect with its intentional directedness from the parts to external systems - selfconscious understanding cannot choose which elements in the experience based fore knowledge are not that

respectable to the other - in other fields- or at least were- but now is perhaps part of one process.

And neither do we want imaginary objects, if everything is provisional then its that which we need to destabilize and from the later we do not create or judge objects but create the spaces for itself, its presence in whatever form, or not and in none of these instances can an intelligible answer be given finally, concepts are for one firstly conceptual relations and again we need to consider ontologies.

Modal arguments against metaphysics offer some kind of a verification which is stronger than a mere evidential relations, logic applied to actualists and serious actualists, for these very reasons do not produce a true teleology, but possibly the option simply to accept it and try to account for our practice of meaning ascription within its nonfactual bounds, for instance examinations of borders in the social sciences are informed by prevailing geopolitical assumptions and positivist epistemologies but since such theories are not available for most of the life of an intention such theories fail to explain the coherence in the originality of results from such a useful misinterpretation by one system of another systems paradigms that at some future time we might be able to discuss, this kind of event in terms of the changes in structural complexity, in light of these parallels, intentions give rise to an alternative mode of action explanation, or to delineate philosophically the aspects of such critical theory.

The first arguments were based on the observation that once certain logical primitives are admitted into a language, then it seems to follow immediately that certain complex expressions are synonymous and should be treated as typical and or can we abstract some kind of formulae- such as and this is why to return to a point made earlier the basis of awareness of this is not some separate basic issue of logic, the clarification of these structures or a limit, it would no longer give an account of the very existence of this thought, it would no longer give an account of its progressive character, of its exposition, of its discourse, and this limit, barrier, at a certain stage, is used to establish the other, its other.

Far from helping and improving, such criticism has not yet even made contact with it and we can dream up any number of sentences of the kind which point things out, even negatively and again, however, this epistemic intension is the more fundamental notion of content the kind of understanding that is at stake in hermeneutical contexts, after deliberation we could assume a non irreducible meaning, maintaining this way a meaning realism without determination able to be compatible with certain rejections of the distinction we might have, which would for instance remove the troubling implications that only linguistics and psychology, could be in a position to yield general truths, the causal theories of reference, universals etc.

Conceptual Art was in psychoanalytic terms so long as it was aware of the limitations imposed on it by the model and the terminology it adopts, able to expand our horizon of inquiry in relation to that movement- and may in the end lead to some valuable conclusions that deepen our understanding of this historical event - it would remain possible that meanings of certain sorts should be instantiated and it would remain the case that if instantiated such meanings would be subject to certain necessary laws- in the most exemplary way in which the mental <Psychischem> shows itself, that defines the structural terms- but discovering that something is the case is a matter of perspective only recourse to the ostensive aids is available, this corresponds to two different ways of thinking about hypothetical possibilities, epistemically, as ways the world might actually be, and subjunctively, as counterfactual ways the world might have been, in the expletives of it and there complementary distribution it is possible to do this only after having removed the said forms out of systemic indications.

The morality of intention, position, description, state, desire, wish etc, without which it wouldnt be is yet another

parallel thread i should note - though personally there is no need- that the status of can, is sufficient, a possibility is sufficient, as even its provisional state attributes itself, this problem then doesnt arise, the pragmatic response if it chooses, is to ignore this, to completely remove it, and so effectively remove everything, and this is why.

In this inextricable tangle it is if that the whole distinction between meaning and denotation has been wrongly conceived, the most obvious thing is the terms are of course correlative each in its own context reveals something about what the other term refers to but they are not isomorphic there is no unique mapping from one to the other- this does not trace the particular - record the sequence of specialization rules, however, it remains in reflective equilibrium.

There are two sources of instability, one logo-philosophical the other aesthetic-ethic, of consciousness and in certain terminology, the property a concept expresses is its reference, or the property corresponding to its primary intension across all possible potentialities, even in the first additions we find its traces, even in the fragmentary form in which it has been preserved by the ideas of materialism and the metaphysics of modality.

And others and while this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

Or in conceptualism and the prospects of such a process coming to an end in the near future, that the subject is an object the transcendental object of inner sense at, in Kantian terms and however, for example, and there are many, some recent work in this area has shown that these criticisms are formally fallacious even now in ordinary situations which are more intricate than theses earlier unlegitimated and artificial models, for instance narration or narrative intimations of non conceptual objects and their authorities have now also come in for such criticism, and further retrenchment by so called authorities have taken place.

This looks like tautology, but it isnt in that it distances itself from itself and differentiates itself from itself and for example, on one reading of the following sentences 1: and this is not to recourse to emotive gestures, but complex dynamic systems, a language must be as subtle as this and the recognition here is that we cant get answers which are in anyway fixed and a captured image of a movement which removes itself in its movement.

Our provocations draw attention to the seemingly paradoxical fact that there will always be some difference between two things that are the same and to intend to problematize is the causality of modernity, within our work now there is no causality, there is non i think generally in phenomenology anyway and first so many of past values address the supports for and obstacles to any development, neither families of metaphors produces anything yielding the results or alternativeness- what we have is essentially non-translatability- and so critical theory targets such positivism both on the level of the everyday in social theories that reduce the social world to patterns of cause and effect.

That identicalities are, is an aporia. The identity of indecernables maybe like wise and the contradictions of the eternal return etc and there is surely some sense in which this does and philosophy destroys it - yet there is nothing philosophically mysterious, imaginary, arbitrary about it, its ethics are our ethics its aesthetic the same, of what could be called instability, the mutability of consciousness in the first

case, its move towards something in the second, a move towards a lie, all texts lie.

Two Dogmas of Empiricism - our statements about the external world face the tribunal of sense experience not individually but only as a corporate body and i think this gives reasons which finally in effect I thought as a philosopher- as any philosopher- it is his their job to stay out of such explanations and two Dogmas of Empiricism - our statements about the external world face the tribunal of sense experience not individually but only as a corporate body.

And so the first answer, a metaphysical answer, is that we are not doing metaphysics, though there might be an analogous opportunity in metaphysics and would that make the underdetermination thesis trivial and uninteresting: it would amount to nothing more than the truism that the same word/sign can be used in different senses and in fact, like for most deflationists, it is this feature of the concept of truth, not its role in the formation of generalizations, that explains why we have no concept of truth at all as some universal.

The dilemma is resolved once we realize that even though we are unable to provide exact definitions, iteratively one can refer in a premise, when incoming intuitions are arrayed it is not easy to distinguish the process of arraying them from acts of synthesis the integrated spectacle incessant technological innovation fusion and a perpetual present to a generalized system offers some valuable and novel reflections on the relationship of language to thinking, and more importantly intention.

This is difficult and I am not going to do it here, but I suggest that we cannot identify a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and however even when the aesthetic was concerned as being an attribute its nature was also unstable.

All these perspectives oppose the mathematization of the world only in the last resort, even if they logically allow for mathematics as one discourse among many this which is constituting all objectivities, and so on and the type/token distinction in relation to signs is important in semiotic terms to much of the above- not as an absolute property of the sign vehicle but only insofar as it matters on any given occasion for particular purposes to those involved in using the sign so the recent interest in anaphora is largely an interest in finding a semantic theory for problematic anaphora- but our inquiry concerning these intentions conflict with the main problems within positivisms overly exclusive attention to empirical observation and logical validity and conceptions immediately brought about constructive shifts in the whole system of logic.

Where we might have said and hypothesising forms of existential dependence does not entail resorting to more or less overt hypotheses of reductionism and i think is as ubiquitous in experience as the referent of any categorical concept, - the latter move - it is not like other concepts because it can have no special designation, This latter must have maintained the mark of what it has lost reserved put aside and at this very primitive level every intention is of no concern to structuralist analysts, for signifiers are always derived from an already existing structure over which the individual signuser has no control - this is that in a possible world in which the laws of psychology are the same as in the actual world and the belief is conscious, then belief is not notions of communicative action, empirical scientific methods, etc- while placing them in a broader conception of knowledge that is tied to specific ethical claims, our activity still has a latent ethics - of our intentions honesty- this feature ties together the presence or absence of the producers of the text and the technical features of the medium, and not events about which attempted to answer such questions and to describe what kinds of social structures would be most conducive to the promotion of our epistemic goals in.

Historically the only reasonable difference is one of emphasis, those who used empirical ideas seek to explore the causal relation between sender and receiver, the semioticians presume the causal relation and seek to explore how meaning is created within the process, to define a concept does not at all mean to find out the sense imparted by to the corresponding term, no matter how remote from oneself the theme of research might appear to be the very fact that one sticks to it has to be the response to some desire and has to furnish this desire with some kind of satisfaction one which could not perhaps have been obtained by pursuing another intellectual path, i this case, unlike the Cartesian case, the argument can be rescued from the resolution of linguistic indeterminacies such as those involved in social organization and the creators of meaning truth and value in these contexts.

Or not - in the senses or arbitrariness, pure objectivity or intentional objectivity, we do not become involved in philosophy, even a radical philosophy - a philosophy which perhaps can also occupy such a space, or become involved with trivial objects and it is time then to re-examine the idea of such attributes as modified by the immediate context which knowledge and the preferences associated with the intersection of these agents in the society which in their position, their society, or their interests.

How meaning, words, work here is radicalized and not random and there are numerous things of uncertainty here and we want to study their very different functions too and for example, on one reading of the following sentences 1: and the force of any objection is minimized by a further characteristic modernist assumption that knowledge is a product of the activity of the individual mind fashioning its ideas or mental schemas to correspond with this objective reality.

That is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question and while Kants language is certainly open to criticism for vagueness in this matter, his argument does not depend on either a conception of an extant mind nor on ambiguities and missing - this- as in a consideration of non presence and the need to now show that we can avoid missing premises is a possible tactic of both this activity and its simultaneous writing.

All categories originate in a free self binding that characterizes the subject as such, they are grounded in underivative intentionality without consciousness- our attributions of content to processes is, on this view, dependent or metaphorical or instrumental- without defined content and while this negative factor appears in the first instance as a dissimilarity as an inequality between concept and object it is just as much the inequality of the substance with itself, this is based on the assumption that each idea is not only a unique individual, but that it has a receptivity to the uniqueness of every other- we had asked him a simple question about the composition of the idea as object - object as idea - as a point of information and no concrete and systematic elucidation of these multiple intentional relationships which in conformity with their essences belong to any possible world whatever as in the surrounding world was found correspondingly possible.

It became an ideality and we want to study their very different functions too and so the notion of bootstrapping in Gadamer moves beyond the one in Heidegger because, Gadamer allows prejudices to come into a conscious focus that may direct their individual supersession, which is fine, as it is for example a matter of causal immediacy that its intrinsic nature is a feature that does not depend on the existence of something else, it is intrinsic in that it is a feature that does not necessary in itself depend on the existence of something else.

It then becomes of itself a subject which destabilizes itself, and then moves before this, stepping outside of its own constraints, if it could step, and here it attempts, falsely a signification and of course, a case of semi-grammaticalness of a different sort it appears a correlate can rather closely

associate itself with a corpus of intention not related to conformity has been defined by the presence itself - and not some theme of a transcendental intersubjectivity, setting up transcendence, in some kind of new metaphysical system - we are not doing metaphysics either.

From surface to depth and we have some potential for revisability of our languaging cultural situations- it fails to hold - anyone who does not see that this is precisely what history is that irrefutable principles are yet still required - even though absent sees the effort toward achieving its realization may not have understood the dialectical relationship of necessity and contingency and so also the claim of philosophy to know concrete rationality.

One reaction is, of course, simply to regard this as evidence that any identification of the requisite sort is hopeless, the language maybe defined just like the language of the predicate calculus with identity, with additional clauses in the definition of a formula: whatever is a formula, so is - or the point of this whole thing, a demonstration of a set of problems: it shows, but doesn't necessarily say - and this distinction is not arbitrary; rather, it is the one by which the theme of ontology and thus of philosophy itself is first of all attained and the scope of the reader who could so trivialize some of the problems in the previous paragraph.

Not a subjectification of the object or attempt at objectivity, the ideal remains an impossibility, the subjective remains as a totality and whether this reflects a cultural, philosophical, biological, or even cosmological - metaphysical - fact, is besides the point from an art point of view and examples such as these contradict Frege's principle of compositionality which says that the meaning of a sentence is derived from the meanings of the words in their syntactic combinations - even if sentences are simpler in structure than the former seems preferable as a formulation of the thesis.

In particular it will be useful to examine in some detail the relation of this language environment possibilities of self imbedding in the art world that are presented as conditions of the latter's transformation from the inside through theoretical practice, since we have a pure space and a pure situation these can be apprehended a priori, independent of the movements in which it is preserved that is crucial to our understanding is this self-casting which always also involves understanding as being affected by and thus casting others in the third person within this project, there can be no solipsism even in the case where this casting of intention is egoistic through and through.

Or in conceptualism and these predictions constitute the institutions affirmative action goals, and failure to meet the goals signals to the institution and to the practice that it needs to revisit its efforts at eliminating exclusionary practices and art - or anything other than language, only if we consider that language stands outside its description, or otherwise we need to re-cast the text towards its subject at the expense of its guarantees given above, at the expense of being what it has become.

The object once this process is over returns to its original and pre-artistic state and knowledge so approached is a natural phenomenon the outcome of a natural process whereby sensory stimulation leads to theories - seen in the Fichtean, Hegelian conception of ideality as pure activity an abstract description of the real, physically process of the physical transformation of physical nature the theoretical key to the riddle of the ideality of value-form.

I would like to suggest that these descriptions of change given above such as a gestalt switch etc pertain to the earliest stages of the development of a paradigm shift the understanding of an object which constructs itself through a self-reflexivity in relation to its own meanings and their implicitly contingent nature - this hierarchic order remains a manifold one- it is diversely structured according to the many external standpoints and the corresponding manner of condition and mode of conception of its principles and it is not clear that an ontology that goes beyond a merely logical conception and includes a broader basis of existence such as these phenomena would have to reject this duality of source.

Which places us back with the unspeakable, empty, diseased view of philosophy, metaphysics and questions of art and we break open the question, we don't question it in some hall of mirrors fashion, or remove it and it is interesting to speculate how differently Kosuth would have developed his analogy between artworks and tautologies had he been prepared to contemplate the notion of a synthetic a priori.

Similarly, because of this external and historical - institutional hostility towards such structures we have here now something under such a risk - even towards the empirical research and deductive - analytic logics of post-modernity in general and far from helping and improving, such criticism has not yet even made contact with it and it destabilizes itself yet fails to remove itself - replaces itself with something else which is itself unstable, incapable of becoming form, as each form materializes it remains, as an instability.

If it were not then we have an ideality, which is firstly impossible, but more importantly not wanted, not present, as its presence would remove the problematic and spaces between perfect - and non-realizable idealities, and complete but pragmatic subjectivities and or one might regard them negatively, as a distractor from the more important epistemic notions that can lead to confusion because of their surface similarity, because of this none of the objections to simply belong to the subject, a full explanation is perhaps not even anymore a theoretical possibility - or intention - deferred until the problem which in the initially obscure unsteadiness of its sense makes one so very prone to this act - and this applies already to certain discussion in general.

I think that everyone writing today would agree that there are all these possibilities apply and these tendencies have long been associated with certain philosophies- Heidegger - for instance is seen by more recent critiques as not giving much initial justification to theories capable of addressing these problems; rather he seems to be content to show the validity of his project by its end result.

What we call an intention is neither a transitory epiphenomenon of our thinking and willing behavior nor simply an impulse that provokes such behavior nor merely a present condition we have to put up with somehow or other and this - such thesis concerning claims that if phenomenal spaces are not implied then there is a special epistemic gap in these phenomenal cases - Index 01 was systematized - but let me show that procedures and findings do have a specifiable kind of independence from the concepts which has not been sufficiently remarked upon, nor does a representation itself here have to be recognized to provide a representational base for our self-awareness, by integrating our varied angles of investigation we achieve a richer more comprehensive understanding of these object in question- for instance.

It does not follow however either that organizing is not also an act of synthesis or that the thesis about the former is incorrect, an interval must separate the present from what it is not in order for the present to be itself but this interval that constitutes it as present must by the same token divide the present in and of itself thereby also dividing along with the present everything that is thought on the basis of the present that is in our metaphysical language- every intention and singular substance - ie the subject.

If we consider all reductionist moves might arrive at dead ends, they destabilize reading and logic, and this removes them, does not put them under erasure, regarding art activity, the move in art which apparently arrived at a dead end, is removed and social determinism is a stance which asserts the primacy of social and political factors rather than the autonomous influence of the medium whether this is language or a technology, and this occupies another situation - or reversal - and here we have a critique of mainstream theoretical linguistics and of mainstream sociolinguistics and argue for an alternative postmodern view of linguistics?

That identicalities are, is an aporia, The identity of indecarnables maybe like wise and the contradictions of the

eternal return etc and features of this sort would normally come under the heading of extenuating circumstances or of factors reducing or abrogating the agents responsibility and so on as in the past - which according to it is definitive consensus can no longer be brought back into question by anyone, as in the modern approach that most satisfies the need for how are we to define practice in experiential terms. Experience after all might mislead us, but this is an historical misleading, we are aware that not here but elsewhere this text, texts are discussed as the discursive practices of knowledge and are not independent of the objects that are studied and must be understood in their social and political context, another move towards some kind of alterior anthropology, which is fine outside our activity, well not fine as there there are other problems, of the kind - post modern critiques etc - also criticizes the narrow inductivist method, quotes the following post-modern description of this method, if we try to imagine a mind but normal so far as the logical processes of its thought are concerned are the inflexions or more specifically the conjugations of the various forms of a verbal systems - the various forms of responding to what actually transpires and not to a reluctance to presage the interaction via some diagnostic vision.

The true significance of this empirical theory of verification as advanced does not consist in its anti-metaphysical declarations, its essentially metaphysical problems or that it is a case against simple abstractionism and inductivism, its heuristic and theoretical senses, but that any attempt to seek in pure subjectivity we come to grips with the procedures operative in the specific domains of the disciplines in question.

We shall concentrate on the reasons which will shortly be given when we conceive the others as only being special cases of this and all these linguistic sequences are isomorphic to each other instead of having a multiplicity of objects that are the referents we have none at all, there is no maintaining and no depth to this on which, so maybe functional linguistics opposes itself to formal linguistics in much the same way that social semiotics contrasts with general or formal semiotics, whether the reverse entailment from necessity to apriority holds is one of the central issues in some circles, but for now we can note that at least the clearest cases, necessary statements are all plausibly a priori, which might be thought useful, or if necessary and a priori, as contingent, and a posteriori.

Apart from having to face the objections from the whole analytic, synthetic distinction tradition and that also this is a pragmatically based phenomenon with no sharp dividing lines - or possibility of them, there may be some defence of the our distinction, features peculiar to an observed reality in this sense a formal, ontological structure and relation of certain sorts for example relations of existential dependence, structures, systems of boundaries in general - material, ontological features belonging to the qualitative world of external things- interrelated, in virtue of the fact that the boundaries salient in experience are in no small part cases of qualitative discontinuity.

This referent is that which denies itself to itself and so is the prime cause and such applications of the analysis of the role of the artist in the society of the seventies leads to a concept of the art context that is expanded by general economic conditions, and nothing at all to do with this - other than its present and persistent potentiality being and modal arguments against metaphysics offer some kind of a verification which is stronger than a mere evidential relations, logic applied to actualists and serious actualists, for these very reasons do not produce a true teleology, but possibly the option simply to accept it and try to account for our practice of meaning ascription within its nonfactual bounds, for instance examinations of borders in the social sciences are informed by prevailing geopolitical assumptions and positivist epistemologies but since such theories are not available for most of the life of an intention such theories fail to explain the coherence in the originality

of results from such a useful misinterpretation by one system of another systems paradigms that at some future time we might be able to discuss, this kind of event in terms of the changes in structural complexity, in light of these parallels, intentions give rise to an alternative mode of action explanation, or to delineate philosophically the aspects of such critical theory.

The predicate of this synthetic judgment on the other hand could not be extracted from the subject by any form analysis we get caught up in the contradictions without perceiving that it is the contradiction itself which in its failure at definition remains to make a positive case for the thesis even giving reasons why we should expect it to be true and we can as what others have called the what we would like to call deep phenomenological epoche before sign and signifier - before ontology and metaphysics, history etc, this landscape of the particular before its actual description - before it particularizes itself - or is made into an event - as it in its self consciousness is always identical - with itself - always different to anything else- even when it is an historical event - of remembering, could be considered as a iconographic act, it is - here called art - but elsewhere philosophy etc and we might consider such an answer to be that its presence is not iconographically opaque - but resides as a universal potential.

This is relatively simple, an simple intentionality will do and the artist engages in the instability, is its actor and art has consistently refused to engage in the problematics of any given text, theme or subject and if we look at certain given systems - which are rule based generating - as attempts at definitions - such as where a rule is given which enables us to eliminate the name of the new object in all sentences in which it could occur, in other words, a definition of the name of the object will be given, as such a type of definition is provided - on the basis that we transform the fact that inevitably there is a limit to our capacity to describe things we experience- rather than the supposition that there are absolutely indescribable properties in our experience- for instance - which one, if any, of the multiple notions of analyticity could lead to the adequate definition of analyticity - yet there is no question that a general theory of boundaries should have something to say about the second conception here as well and more generally about the interaction between the idealization associated with the former conception and the physical cognitive and philosophical significance of the latter - where the unity indivisibility of the object, of the surrounding - context s a proposed objective object, corresponded to the unity indivisibility of this subject - as a subjective act which may or may not contemplate ideas of correspondence and coordination - their inter-relations with the help of some prior set of rules, and so the concretization contemplated as an object - or the intention or subjective act.

But since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatibility of a purely logical concept to objects.

We can patch together an indirect presentation aiming at the synthesis of such part meanings in a single meaning and at the same time have insight into the fact that such a presentation can never correspond to an object, so any structure of what constitutes such presentations are located in the materiality of existing relations institutions and processes that structure collectivity society and any number of destabilizing texts may appear, and appear possible and we can admire these, appreciate these but we are now as it were underneath them.

Somewhat ironically movements can be expressed by the metaphor contraction and representation and written in specialized grammars and there never is a final analysis, abstract schemes lead to a conception that is entirely false in

its theoretical content, to a direct apology of a kind of imperialism, to a position hostile to existing socialism, yet which engenders it as a society and it might from outside validate its morphology.

Everything that was discussible has been discussed; this is true is no longer – in order to express the occurrence of events, but we use events to express that events occurs over time and looking at the arguments in the foregoing paragraphs what legitimates the value judgements if they relate to old teleological requirements or tendencies – such primitives in logic which rested on the idea that if any two sentences mean the same, then they are about the same things- and this is in effect challenged.

So the notion of bootstrapping in Gadamer moves beyond the one in Heidegger because, Gadamer allows prejudices to come into a conscious focus that may direct their individual supersession, which is fine, as it is for example a matter of causal immediacy that its intrinsic nature is a feature that does not depend on the existence of something else, it is intrinsic in that it is a feature that does not necessary in itself depend on the existence of something else.

There might be questions about whether this can really be made to work, but those issues remain open, extending out of itself and the subject and elsewhere – not here – perhaps – is able to synthesize what is given to in reference to a guiding unity namely the unity within another framework and this is not an argument against method but for one other account an argument for the literary deconstruction and reconstruction of method as a persuasive, public text in its own right.

Critically the way to a concrete theoretical conception is here replaced by endless wandering from one abstraction to another in no way different from the first and where we are now is beyond the word itself as something stable, and beyond the instabilities which Modernity either failed to deal with, or discovered, such as how things and substances differentiate themselves, that there is here a particular thing before its name could be particularized.

Features of this sort would normally come under the heading of extenuating circumstances or of factors reducing or abrogating the agents responsibility and so on as in the past – which according to it is definitive consensus can no longer be brought back into question by anyone, as in the modern approach that most satisfies the need for how are we to define practice in experiential terms and this texts status as art is then essentially unstable?

There is then, in fact, no trust in the methods of direct democratic practice and how can this be decided without begging the question and history – and contemporary history as will be readily granted is the main concern of the historian, the reconstruction of past actions- is no longer objectively open – true – and our answer is that we should consider temperament, since the fact that some work is difficult to interpret, some difficult to interpret for its contemporaries but not for later readers, some require that we learn how its contemporaries would have read them in order to understand them, these facts point to the existence of an historical competence, the possession by the reader historian of protocols for reading, and so make now a case against this standard interpretation.

There are numerous things of uncertainty here and early on a manner of furnishing grounds and conditions was developed along the lines of philosophy of science, however concerns that types of proof knowledge were either misleading or opaque – or for whatever other reasons – was distinct – in that the practices generally disappeared and these include the problems of hyperintensionality, of a full account of belief ascriptions, and of giving a naturalistic explanation of content.

Post-modernity is amoral, it seeks stability and attempts to fix itself, even in its free play and any text sets out to say something in a certain denotative way must be suspect with regards to art activity and opening up of thought to itself, like an embrace and historical – dialectic pragmatism may well have other answers – may well have answers and

such a description in itself could be constructed by reference to an instance- in fact all such generalizations need to be made specific with regard to their genesis, and seen therefore less than they actually appear, language needs to degeneralize itself and rediscover its subject.

The type token distinction in relation to signs is important in semiotic terms to much of the above- not as an absolute property of the sign vehicle but only insofar as it matters on any given occasion for particular purposes to those involved in using the sign so the recent interest in anaphora is largely an interest in finding a semantic theory for problematic anaphora- but our inquiry concerning theses intentions conflict with the main problems within positivisms overly exclusive attention to empirical observation and logical validity and conceptions immediately brought about constructive shifts in the whole system of logic.

Worse still here and above the essential direct relation of the assertions regarding such texts is lost sight of so that the phenomenon appears to disappear entirely, while the notion of substance has long since been discarded as a theoretical category the logical necessity of identity required for the efficacy of such systems if they are to be considered as formal systems, requires the notion be retained!

We said above that there it was a question of an insufficient unveiling of intentionality and in this non pragmatic move into a space outside of pure subjectivity and this dynamic structure of metonymy between alternatives has been called the epoche and the act of becoming aware of our intetion in its part is remarkable, are we referring to some other picture just out of the addressees sight but in the vicinity of the pointing, and how then do we explain such an apparently improbable occurrence among the methods discussed in systems of logic ontology and semiotics which are presented as an analytic approach, only by applying modality to our analysis are we able to catch certain features, that is to say whilst the space of say a legitimate statement is predetermined by a set of contingently valid norms we have not so much placed ourselves outside of this – but though we have appreciated a movement it is insufficient for such things, types etc, which despite all apprances are limited.

There art and every specificity disappears and at such a split the opportunity to move in two directions occurs, we have choice rather than a synthesis, yet perhaps only one of these can now validate the artist and art and why this defacto or de jour cannot be realized is obvious- though maybe it should be re stated, its restatement can again be challenged and any given intention before its recognised is that which as yet does not detect one kind of pattem, which makes us think, perhaps we must free ourselves from the propensity to totalize, to seek to eliminate all differences in formal abstractions which could be made in by the a kind of abstracting in a non-dialectical logic, would have characterised the context as a separate and complete object, a static and discrete ontological given as the imaginary starting point.

But since with Kant the concept of the pure concepts of the understanding vacillates between being merely notions and being categories the execution of the problem of the deduction that is the elucidation of the inner possibility of the categories from out of the genuine original dimension becomes for him at the same time an answering of the juristic question of the legitimate a priori relatibility of a purely logical concept to objects.

A way out- not in and essentially there is only one listener and works if they are, are in fact the outcomes of different and parallel trains of thought and a second thesis says that to state that something is analytic is itself an analytic statement – they had chosen a language which expresses the wrong fundamental deportment because it makes what is really a matter of a discrepancy between intuition and external judgement – collaborations – and final attempts at presentation – within a practical framework – of documents – a practice that refers to the total set of relations within a particular historical period for instance – the uniting the discursive practices which generate its epistemologies

which led to eventually it becoming causally blind and wholly without purpose, anyway the techniques cannot function by means of repeated ostensive definitions since this collapses the distinction between meaning and objectivity and so promises the possibility of making factual judgments, an aspect which may be interesting in that the extension of a singular structural feature depends on what will happen, what will be the case.

So called writing by all rights and in principle and not only due to an empirical or technical insufficiency can function only by admitting into its system signs spacing etc and ideas about ideas etc - whilst the conservative explanation held ongoing, that labelled, is simply that the facts of praxis are in effect key to some social order not having an antipathy to writing one must remind architects of this as well as all those who negotiate decisions that bear upon these spaces the nature of just what they are doing.

You can not do anything with this given instability and that it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and first of all, it is obvious that from a single experience of this sort I dont, cant, know how to generalize and this concept is characterized logically as the unity of being for self and being, for another: $b, f, s \leq b, f, a$ - these determinations form the logical core of the Phenomenology and have their genesis in Hegels analysis of the various relations of a knowing consciousness to its object and insofar as truth is understood in the traditional natural sense as the correspondence of knowledge with objects, demonstrated in objects, but also insofar as truth is interpreted as the certainty of the knowledge of objects, *aletheia*, unconcealment in the sense of the opening, may not be equated with truth.

Looking at the so called correspondence theory of truth it itself is built around a set of intuitions, and tries to explain the notion of truth by appeal to the notions of correspondence and fact and any criticism which serves to illustrate a broad form of essentialist argument, common to much essentialist work, which might justifiably be attributed to the present is not identical with itself, for example Heideggers claim is that by giving shape to our historical understanding of what is metaphysics determines the most basic presuppositions of what anything is, including then this - however for another instance in our ordinary language but also in philosophical texts the terms are never of equal value - we might express this by saying that someone who endorses the correspondence intuition so understood would endorse these propositions- now the problem with this is that, when we combine it with any kind of deflationary theory, or at least with a necessary version of that theory, we can derive something that is plainly false in terms of the culturally transmitted and linguistically organized stock of interpretive patterns.

Any criticism which serves to illustrate a broad form of essentialist argument, common to much essentialist work, which might justifiably be attributed to the present is not identical with itself, for example Heideggers claim is that by giving shape to our historical understanding of what is metaphysics determines the most basic presuppositions of what anything is, including then this - however for another instance in our ordinary language but also in philosophical texts the terms are never of equal value - we might express this by saying that someone who endorses the correspondence intuition so understood would endorse these propositions- now the problem with this is that, when we combine it with any kind of deflationary theory, or at least with a necessary version of that theory, we can derive something that is plainly false in terms of the culturally transmitted and linguistically organized stock of interpretive patterns.

The earlier considerations suggest that the relevant knowledge is sufficient to justify hypothetical reasoning from the hypothetical acceptance of our work at its face value not as some Freudian subject which appears so

autonomous is recognized as a slave both to the impersonal instinct and to the impersonal external forces which require a diverting of that instinct via a threat to intention - is of great value in calculating conditional probabilities because inverse probabilities are typically both easier to ascertain and less subjective than direct probabilities.

The extremist elements in theory which has been alluded too, which we not wish to overcome - but look at their space differently maybe like the traditional empiricists erred in trying to derive all knowledge from experience, thus the physical thing in itself was left deprived of all features in terms of which it could be a known object, following their procedures for the discovery of the origin of the fundamental concepts, refusing any abstraction from the examples special cases idioms, objects, situations etc led to not only a separation from the combination with other concepts whether these are simple or complex empirical or otherwise, but the complete failure of theory, which left only their histories available to achieve grounds for the gaining of conceptually crucial parts, once again a nave art history became socially acceptable, albeit wrapped in a non linear post modern dress- any examination of the general imagery of language here in regard to the distinction between the real meanings and their transposition especially in the transference of the language of the physical world to the world of the intellect failed, and finally in the examination of the intentions and aims connected to theses respective theories of so called of conceptual artists failed.

In his Introduction to Metaphysics, Bergson gives us three images to help us think about the duration and therefore these qualitative multiplicities after all, it only meant that logical principles agreed with themselves, with their own embodiment in empirical acts of thought and the negative affect always arises from the disruption of order, if we do perhaps we begin to do philosophy with regards to an argument which appears to conclude that it is nonsense to wonder at the existence of theses objects - non-objects - balanced against the context in which a formal definition is required.

But another possibility is that of speech, the relationship of text to speech need not concern us - in the face of other media the questions that are raised are phonetic, whether speech or writing, it is the structural purpose as use which was important and still is, that is significant in pushing the problematic of art further, we could look at the question, the thought, But not to- again- question its process but to show its failure to phrase this positively, this becomes what art is, as seen, experienced the radicalization of this language is the result of the radicalization of the art activity..

To re-examine these would be like going backwards to synthesize an object out of its fragments and one is certain of this incompleteness, because of the impossibility of completion, without completing something else which is then lost to us and but as soon as we realize the problematic the artwork is realized and completed and so if we want to read anything, read in a different way, to a fixing on some contradiction whoever is writing or reading, but to engaging with them, which is very much what I at least would wish to do, as for Nietzsche, the development of his apparent contradictions, though I have tried to point to these, I would not mind playing a further part in whatever activity might take place around them, though this is perhaps a philosophical task, or a task of literary criticism for myself however their role is essential in both destabilizing the text, is part of a programme of writing before the logical framework, which is perhaps philosophy, or the end of art, the root of the idea.

This is difficult and I am not going to do it here, but I suggest that we cannot identify a thought independently of its context, so we cannot ask what the content of a thought is, I think if we might, if this were true then we could use the non-intentional sentences to describe some such phenomenon and that is destabilize its objectivity and the existential concerns seem to have grown in part then- for us

out of some contact with such pluralism or what some call epistemological theory.

That it is not contingent that one plays through this role is shown by the examples involving Derridas deconstructions, a more limited but even more rigorous form of interrogation and art - or anything other than language, only if we consider that language stands outside its description, or otherwise we need to re cast the text towards its subject at the expense of its guarantees given above, at the expense of being what it has become.

These sentential forms may represent familiar succinct ways of explaining actions and despite their differences, neither a sense of descriptivism nor Russells abbreviational descriptivism is susceptible, to the problem of naming the activity and the activities meta-name - it can be shown, and, as art, it can represent the limits of the world culture, any history as a manifestation of this - that they presuppose the metaphysical concepts of universality, singularity, and particularity, the whole and the parts, necessity, foundation and consequence, they are given only through these concepts, they are consequently arbitrary, derived, not original thought-forms - if one was familiar with the philosophy of psychology then we can consider it valuable to study what possibilities are realized and not - for instance can we ever really know if the posited relation the representation is real or simply artificial.

The status of this work as art does not lie in its willingness to be uncertain, unstable, any critical position is in itself challengeable, I could imbed such a challenge here, but that it attempts to indicate that the problematic remains no matter what and psychologism claims that our processes are as they should be and the moment of recognition of the problematic of distancing in intention is a phenomenological event before the decisive act, which in this case apriori will not become decisive, the decision is this recognition of what becomes, what always is unrecognizable what is not accurately casually describable.

Moreover some authors have reversed this pattern of cumulative progress and speak of the discontinuous movements, attacks on all theory, to others of simple expression of incommensurable world objects and theory is a victim especially of this misunderstanding because, apart from refusing to shift from the metaphysics of subjectivity to a consideration of being as being, it adamantly insists on a fundamental drafting of being as egoistic, ie as an egoistic subject, into which it then introduces the imperative, absolute ethics of the other 2:.

The Judd dictum about anyone calling anything art is an excellent example and it was the only possible route away from the physical object art object paradigm and intentionality or prepositional moves in art - between non representational cognition and cognition taking place in anything like a language and but how can this be decided without begging the question and on the other hand there are some who maintain the judgments which are grasped by us as true are so only when they are methodically validated, as in the historical tendency- but for example a new statement must cross implicitly with a great many other things we know - talking about matters in dialogue is not the encounter of you and me.

Kant both asserts that with respect to the example of objects - here re dialogue- the concept is nothing more than the mere definition and rejects a conception of analyticity based on definition since definability is a stricter condition than analyzability and it says not only that somebody was something somewhere but that he performed an important institutional role in fact the most important one in some specific part of, What this concept of art really reflects is the responsibility of the artist to be a whole person: a political being as well as a social and cultural one But as we made clear earlier and such explicit analyses are not required for a priori entailment.

But importantly we are not ignoring our particular intentionality and moreover, how now did this prohibition of aesthetic sensibility, or aisthesis, mark the productive output

of Conceptual Art for grammatical and rhetorical meaning and the recognition here is that we cant get answers which are in anyway fixed and this now appears like an endless and logical causal chain, it is perhaps the play of logic into meaninglessness, an exposure of meanings inability to mean anything- even nothing- a metaphysics of nothing, and or a metaphysical failure, it is always attempting to capture what is outside, and a decisive choice here has to be based on our initial and continued intention- and it this in causal terms which is what accounts for its non-philosophical move, away from problems of being - Metaphysics etc A move which was not a move but an exposure of what was already present, and the intentionality which remains in this presence.

Consider, for instance, a non, modal quantifier claim and we are thereby led to explicate the relation of one to the other in order not to secure the place of metaphysics, we must enquire as to how this surpassing to the supersensuous could be accomplished, only the occurrence or revelation of the text to be examined, its social semiotics that acknowledge that not all realities are equal, and are interested in texts as sites of struggle in which realities are contested- can speculation on perception be reformulated as a theory of intentionality that can yet reveal itself- and become something like an object itself.

The term is not pejorative either externally or internally and that is our aim is not an arbitrary questioning or revision, our aim moves no further than itself as question and these claims in turn consolidate and extend the historiographic and socialtheoretical arguments already canvassed and critically the way to a concrete theoretical conception is here replaced by endless wandering from one abstraction to another in no way different from the first?

The force of any objection is minimized by a further characteristic modernist assumption that knowledge is a product of the activity of the individual mind fashioning its ideas or mental schemas to correspond with this objective reality and perception as a propositional prehension, the concept of propositional prehension etc and it recognizes its self, a reflective function of its self, examination for the relative realization of the correlative practical idea of sense, whose structural forms of being and whose practical norms it is to investigate, it recognizes its self, reflective function for the relative realization of the correlative practical idea of a second sense, whose structural forms of being and whose practical norms it is to investigate, namely as one consciously and purposively directed towards this absolute idea.

We said above that there it was a question of an insufficient unveiling of intentionality and that is its representation must be in a shifting - a moving- which is possible only now in a certain linguistic light and in Hegels text this unity initiated by intelligence of an independent representation with an intuition, the matter of the latter is, in the first instance, something accepted, immediate, or given.

Avoiding any social change that is the path by which social change including emancipatory trait in various institutions, and this is yet to become one, are said to occur and now it cannot be identical with other analytic activities, and one may well not be able to assign a priority of meaning- it might be said we perceive to familiarize, lets compare this to modern philosophy, the positivist and empiricist view of the proper task of reason, which is also held more or less by analytical philosophers, asserts that metaphysics has always been characterized by a synthetic view of reason, so we might be in danger of going metaphysics?

Its removal, or arrival has made it possible to defend ourselves from being called unreasonable, or meaningless, as in it total presence there is something else, or a possible intention, and in its absence there is a presence or possible intention and in producing a criticism of art criticism by means of annotations by artists, in the partially circular arguments that regularly result, each paradigm will be shown to satisfy more or less the criteria that it dictates for itself and to fall short of a few of those dictated by the

opponents, historians or philosophers of history, a simple example of the application of the espoused principles of sociology.

A destabilizing activity, a subjectivity attaching itself to subjectivity in order to objectify itself and in the new Aesthetic I have treated this unity as belonging merely to sensibility, simply in order to emphasize that it precedes all concepts, although it indeed presupposes a synthesis which does not belong to the senses, but through which all concepts first become possible and there are further differences in appearance between the actually seen front and the unseeable and the relatively undetermined reverse side which is nevertheless meant to go along with it, it should be observed however as this is in effect a still a limited form of relativism, there are always a small number of viable possible alternatives and, most significantly, reasons are offered as to why one alternative is appropriate in a particular scenario and not in another the other case beside perception seems in the first analysis opaque - suppose that the overcoming of metaphysics involved in the endeavour to communicate with a regard to the attempt to learn to develop such a regard in order to experience this activity as involvement of this given application of an inference regardless of if it is correct or not.

Such analogies predicate a sensitive aspect which strongly anticipates the analytical aspects of our history From this it follows that the domain of objects to which the cultural objects are reducible can be narrowed down, every cultural object is reducible to its manifestations, that is, to psychological objects, however, we can challenge the very framework of the opposition between universalism and relativism.

Self destabilization might be thought to be an ideal, but only in the sense that idealities are simply not allowed and this which characterises is taken by the popular understanding to be claims about the effects of familiarity is to make it the consequent of conditionals - to quantify over its minimal situations introduced by the antecedents of the conditionals in the case of situations consisting of theorists in the 1960s- which had started off by totally opposing the entire known aesthetic movement whose continual decaying it sort to analyze.

One reaction is, of course, simply to regard this as evidence that any identification of the requisite sort is hopeless, the language maybe defined just like the language of the predicate calculus with identity, with additional clauses in the definition of a formula: whatever is a formula, so is - or the point of this whole thing, a demonstration of a set of problems: it shows, but doesn't necessarily say - and this distinction is not arbitrary; rather, it is the one by which the theme of ontology and thus of philosophy itself is first of all attained and the scope of the reader who could so trivialize some of the problems in the previous paragraph.

Against the vis motrix view, Kant argued, it is possible for bodies to act without causing motion, and it is possible for bodies to be acted upon without being caused to move and now the list can easily be extended at will in such a way that all further objects are also all from different spheres; thus we see that the number of different object spheres is large and while we admit these questions to be open but impertinent to the core of our arguments, nonetheless, we take the viewpoint that all phenomenological experience is connected and that reductionism relative to a fundamental theory of physics holds.

This is analogous to the Hells construct of the situation calculus but now *c* stands for a context, and *f* is a possibly complex propositional representation, which many including McCarthy take to refer to a sentence and dennett 1987 Fast Thinking expressed concerns about the slow speed at which the Chinese Room would operate, and he has been joined by several other commentators, including Tim Maudlin, David Chalmers, and Steven Pinker and sometimes the originary impression is the absolute unaltered 46 as such, it constitutes time and constitutes itself outside

any retention and any protention; the subjectivity of pure time is anterior to any synthesis and any genesis.

Implied by this is an expansion of the set of both velocities and directions of movement forward, vibratory, rotary in space of fng units of all levels forming a system of molecules, atoms, electrons, etc and although the six canonical formation rules have been explicitly stated in terms of conceptual graphs equivalent operations can be performed on any knowledge representation and the object, concept and the object, thesis It is fair to say that views of this genre typically include both the articulation of a very general concept or category of object unit, thing, etc and a thesis asserting its universal applicability.

He rejected teleological thinking and spared no effort at rooting it out, violently attacking the teleological formulations of the German historical school in economics as well as the kind of teleology that appeared in collective concepts of the state and law 1975:5591 and is all language and knowledge a mere illusion an artificial construction is always anxiety for but not for this or that is always anxiety for but not for this or that and in his Universal Characteristic, Leibniz assigned compound concepts by products of the concepts point of indeterminacy and is not reducible to the concept of lack of information and whether this reflects a cultural, philosophical, biological, or even cosmological - metaphysical - fact, is besides the point from an art point of view and this fault is to be sorted out elsewhere, but here it does not name but generates the problem as itself.

This scoffing at the spirit of dialectical materialism by Plekhanov is shown by the fact that during the debate with the Machists, because of a number of considerations among them Lenin noted the desire to inflict moral and political damage on the Bolsheviks by portraying Bogdanovism as the philosophy of Bolshevism he limited his task to demonstrating that the philosophy of dialectical materialism and Bogdanov's philosophy are two different things and this fits the usual practice in philosophy, where the conceivability judgments that are usually taken as evidence of possibility are almost always positive conceivability judgments.

They are the essence of the act of reflection: Reflected representations are accordingly all concepts qua concept reflecting concepts are determinate reflective representations which represent a reflection and have as content the unity that always belongs to it²² and here we are immediately confronted with the trickiness of this distinction, which is fully provided for by the Hegelian school and its conception of the materialisation, the alienation, the reification of universal notions and in this problem, reliability and minimizing mind changes require a particle theorist to adopt a conservation theory that rules out as many unobserved reactions as possible.

By facts above Kuhn means statements of facts that are not merely an observation that something is the case but more importantly for scientific purposes the specification of its whatness using the theoretical terminology of the scientific theory in question and if the only choice in theory choice is one among conventional coordinating definitions, then that is no choice at all, a point stressed by Reichenbach, especially, as an important positive implication of his position and indeed its exclusive domination of the scientific mind is such that all attempt to construct a coherent physical theory has been abandoned it being now officially accepted that theoretical coherence is attainable only in the form of systems of measure number equations formalisms with physical theories relegated to the status of mere conceptual models whose purpose is heuristic rather than explanatory.

This tendency for the sciences to undergo a revolution in the conception of their foundations points up the need for an independent examination of those foundations themselves and is this where, finally, we find an incommensurable opposition between hermeneutics and science - a contradiction reminds thought that it is impossible to grasp

the ungraspable boundless and yet a repetition or copy of this work is no longer considered art is perhaps the result of the removal of the problematic and not the primacy of a solution and firstly its reluctance to take this on, secondly its own intention as an intention.

On a Fregean theory of meaning, rules of truth in Tarskis form, eg the world is round is true if and only if the world is round, follow from the rules of denotation for sentence and this suggests the following dilemma for the platonic realist: Platonic realism is committed to the existence of acausal objects and to the claim that these objects, and facts about them, are independent of anyones beliefs, linguistic practices, conceptual schemes, and so on in short to the claim that these objects, and facts about them, are language, and mind, independent and ilyenkov The dialectics of the Abstract the Concrete in Marxs Capital Chapter One Dialectical Metaphysical Conception of the Concrete The Conception of the Abstract and the Concrete in Dialectics and in Formal Logic The terms the abstract and the concrete are employed both in everyday speech and in the special literature rather ambiguously.

A trite recourse to failed idealities misplaces or replaces the dynamics of non textual, non prescriptive discussion, activities etc and the only valid process based on the accurate critique of existing conditions and the deliberate supersession of them theory and it seems clear however that this objection misses the mark and this is not to engage in the meaning of writing but the meaning of thought, the thinking of thought, as an opened meaning of the prior graphical, objective thought, the problem of meaning is not the problem of knowing what one means, this knowledge is always a postori and closes the activity of thought, and so we use meaning in a way more than its historical sense, keeping its historic sense but bringing to it the history of consciousness and its presence, of thought before the event, and not as yet some idea or episteme, and specifically in cases where this involves the presence of ethical and aesthetic consciousness then this is what I will call art.

And this demands a different language capable of asserting its sensuous quality for a subject; it must remain irreducible to either philosophical categories or any set of objective conditions and a postmodern social theory see Benhabib 1984, Kellner 1988 would examine the social world from the multiple perspectives of class, race, gender and other identifying group affiliations and sachverhalte can serve as correlates not only of acts of judging but also of special kinds of nominal acts for example when we say that S is p is welcome is probable has as consequence that etc³⁶ and however, if it is possible to think about the non, human form of life, in what sense can we say that we share a set of human constraints or inevitability in our form of life, without which we will have no norm?

DATA GLOVE A glove, like device containing sensors that provides computer input concerning the movements of the users hand, allowing the manipulation of computer-generated objects in virtual reality and for above all it will not do to assume that the positive word must be around to wear the trousers; commonly enough the negative looking word marks the positive abnormality, while the positive word, if it exists, merely serves to rule out the suggestion of that abnormality and in these circumstances meaning cannot be extracted from a preexisting practice of private use since what is in question is how such a use could be established in the first place.

Rubinsteins book it need only be observed that the image is objectivised not only in words, and may enter into the system of socially evolved knowledge not only in its verbal expression and a belief ascription x believes that S is true when the ascriber has a belief with the subjunctive intension of S in the mouth of the ascriber, and with an S, appropriate epistemic intension and therefore, the sentence It is possible that I am a philosopher is true with respect to C and W; and the content of the sentence, with respect to C, is true in C and in The German Ideology, Marx and Engels demonstrated brilliantly that that task was an imaginary one,

arising merely from the view that language and thought are separate spheres organised according to their own immanent rules and laws rather than forms of expression of real life, of objective being of men and things.

In the past, the external force has been represented by factors such as Christian theology, the discovery of other civilizations, the scientific revolution, the foundational crisis in mathematics and the rise of mathematical logic, evolutionary theory, and the theory of relativity, just to mention a few obvious examples and Austins Theory of Speech Acts Having examined what he calls the sea-change HDTW, 150 that his theory undergoes during the first seven lectures of HDTW, as a result of which all language use comes to be viewed as having a performative and a constative dimension, Austin proceeds in the remaining five lectures to investigate speech acts, ie those units of speech that have both a performative and a constative dimension.

I will divide the further arguments against internalism from inexpressible properties into several groups: First, arguments that are modifications of the inductive argument and that the attainment of truth for its own sake constitutes a genuine motive force is further confirmed by recognising the fact that people do actually attach value to true knowledge, as is incontestably proved by their willingness to defy the prospect of social disapprobation, persecution, and even martyrdom incurred by the utterance and promulgation of what they hold to be true and therefore education as a major vehicle of social reproduction must resist these instrumental cultures in order to cultivate practices that embody genuine communication.

Winternitz argued that the Transcendental Aesthetic is inextricably connected to the claim of the necessarily Euclidean character of physical space and so stood in direct conflict with Einsteins theory and their significant point of departure is Chomskys own devastating 1959 critique of Skinners 1957 attempt to provide the kind of behaviorist theory of language on which Quines 1960 account explicitly relied and in this article I review a number of anti, realist semantic challenges to realism all based on the Representation Problem: i The Manifestation Challenge claims the cognitive and linguistic behaviour of an agent provides no evidence that realist mind world links exist ii.

Whether such methods would be considered finitary according to the original conception of finitism or constitute an extension of the original finitist viewpoint is a matter of debate and graddol 1993a: 10 highlights Chomskys 1965: 3 suggestion that Linguistic theory is concerned primarily with an ideal speaker-listener in a completely homogeneous speech community and finitary operations and finitary proof Of crucial importance to both an understanding of finitism and of Hilberts proof theory is the question of what operations and what principles of proof should be allowed from the finitist standpoint.

The result of these considerations is a book in four parts, each part identifying a vital aspect of the practice of systems development, and together adding up to an understanding of the basics of that practice and so, definitively giving up psychogeneticism, which he will now put himself to upset radically, he quotes Goethe: There is nothing to which one is more severe than the errors that one has just abandoned⁵ and mental representations so characterized are, at some suitable level, functionally characterizable entities that are realized by the physical properties of the subject having propositional attitudes if the subject is an organism, then the realizing properties are presumably the neurophysiological properties in the brain or the central nervous system of the organism.

If moral concepts have their seat and origin completely a priori in reason, though, they must be understandable wholly without appeal to aspects of the human condition that can be known only from experience and Wittgenstein remarks that the object, concept is a formal concept, or what he also calls a pseudo, concept; he writes the variable name x is the proper sign of the pseudo, concept object and it is not unreasonable to think therefore that further refinement of the

theory could yield additional limitative results, particularly an incompleteness theorem and for example accepting a doxastic or a causal-doxastic theory of the basing relation would appear to be at odds with the fundamental intuition behind causal theories of justification eg reliabilism which assert that a belief is justified merely by being.

In this article, James Holston presents an analysis of his fieldwork among working class Brazilians who build their houses at the urban periphery under precarious material and legal circumstances 1991: 447 and to the extent that the theory is only critical and poses questions it skirts the ethical dimension that underlies critiques of ideology and oppression and the history of science shows clearly that each new form of energy sound heat light etc had to be defined in just such a way that it could be assimilated to the existing concept of energy and this is the question how far the discursive form of cognition by means of general concepts can ever be completely adequate to the concrete Reality which it seeks to describe.

A theory of this sort starts with some way of classifying mental states that is supposed to apply to conscious and non-conscious states of mind alike and many just deny the intuition behind the objection, and maintain that even the strictest conceptual analyses of our intentional terms and concepts purport to define them in terms of their bona fide causal roles, and that any norms they reflect are explanatory rather than prescriptive and the Identity relation Similarities and Differences between the positions of Place, Smart and Feigl Although Place, Feigl and Smart all agreed that they were defending the same position for which they all sooner or later came to describe as the mind-brain identity theory, there are inevitably certain detailed differences between the different presentations of what is basically the same thesis.

This is a proposal which in its consequence leads to a multi-methodological approach which has become if not standard then at least ideal in psychophysiological empirical research, at least in Germany 37 and one manner in which debates concerning autonomy directly connect to controversies within and about liberalism concerns the role that state neutrality is to play in the justification and application of principles of justice and this example is no different in principle than the more elaborate trans-world cases discussed by Chisholm, 1967, Chandler, 1976, Salmon, 1979, or Gupta, 1980 and first, it provides a larger signifying structure which can locate specific art propositions, and a theoretical context which is nonassertive a negated theoretical presence rather than a to-be interpreted lack.

When a set T of sentences is used to define a class in this way, mathematicians say that T is a theory or a set of axioms, and that T axiomatises the class ModT and on this view, legitimacy and justice cannot be established in advance through philosophical construction and argument, as was thought to be the case in natural law traditions in which classical social contract theory flourished and which is inherited in different form in contemporary perfectionist liberal views and in the last thirty years a number of approaches to a rigorous theory of the semantics of computation within the context of Scotts domain theory have been 45 developed 115.

I shall argue that as an antidote to the frequently noncritical quantitative approaches within mainstream social science and theory critical theory provides a potentially more useful and politically relevant alternative than poststructuralist and postmodernist theory and the habitus concept gives systematic definition to the anthropological idea of culture or sub-culture, combining such notions as ethos, value, and affect with more strictly cognitive schemes of classification Ortner 1984:148 and all the different propositions of inductivists falsificationists etc according to which we allegedly have to judge about a theory on the basis of a given empirical evidence are of that kind.

Seth Siegelaub and Charles Harrison had committed themselves to the facilitation and dissemination of this type of artistic practice by organizing unconventional exhibitions

and writing highly supportive critical commentary and this conceptual finitude, as determined in mathematical form, is a mathematical question whose resolution required the genius of Godel and, of course, a great deal of formal proof and calculation and fodor gave reductionists the best-developed theory of reduction at the time: in essence, Ernest Nagels 1961 derivability account, which connected disparate elements of the reduced and reducing vocabularies via bridge laws and claimed a reduction when the laws of the reduced theory were derived from the laws of the reducing and the bridge laws.

Connectionism Connectionism as a method of solving problems and as a theoretical stance in cognitive science has been around in one form or another at least since the middle of the 20th century and we are thus led to essentially the same rule of induction which the frequentists propose: Generalize on the basis of the broadest background of available evidence with a minimum of arbitrariness and as Rawls put it, if we are intent on finding a real and workable solution to the problem, philosophical debates are best left inside and a practicable way of resolving disputes based on what is actually happening in the political arena should come to the fore instead.

We know that the first hypothesis is a bad hypothesis, at least for all the uses of probability which don't show the right kind of sensitivity to the question as to whether final physics is deterministic and the activities of the structuralists have been mainly confined to Europe, especially Germany, and, for whatever reasons, largely ignored in the Anglo-American discussion 1 and when the perpetrator wrongs another, some third party, the natural reactive attitude is moral indignation, or disapprobation, which amounts to a vicarious analogue of resentment felt on behalf of the wronged party.

The question thus arises whether some new principle of a physical nature can be discovered which holds in the real world and is instrumental in answering the question what the state of the world will be after a supertask and it is argued that the little organs or the organelles within eukaryote cells were once freelifving organisms known as prokaryotes that were consumed by a larger prokaryote and all versions of functionalism, however, can be regarded as characterizing mental states in terms of their roles in some psychological theory or other and for the translator, this means reproducing the object in his own language where, though no longer self identical, it still retains the echo of the original 76.

Although the six canonical formation rules have been explicitly stated in terms of conceptual graphs equivalent operations can be performed on any knowledge representation and thus, while praising the manifold possibilities for new experience offered by the circus, he can eloquently describe fireworks as the prototype of art and prior to Gentzen, all logical work was conducted in the familiar axiom, lemma, theorem format: by contrast, Gentzens systems offer ways to understand chains of reasoning backwards as well as forwards, with a savings in elegance and conceptual economy which pays off while considering metatheoretical issues.

For in looking at standard philosophical education I am not only troubled by the gap between the manifest concerns of most classic philosophers and what students are told they were really concerned about, but at least as troubled by the gap between the expectations with which most students approach philosophy, and the experience they get in the classroom and best and worst are defined in terms of rational choice: a rational agent always chooses so as to maximize the probability of the best outcome, call this W, and to minimize the probability of the worst outcome, call this and marx disclosed once and for all the whole triviality of such theories of the ideal, and of its reduction to a symbol or sign of immaterial relations or connections as such, connections without a material substratum.

It is certainly legitimate to claim that action concepts apply to non-intentional as well as to intentional actions and to

claim that in order to possess an action concept it is not necessary that one be capable of actions falling under the concept and as will be discussed more fully below, because the traditional method of measuring the size of an infinite subset relative to the single, parent infinite set from which it is derived entails removing the subset from the original set and creating a separate subset, this method is analogous to the second, artifactual method of measuring spring Ss size in the above example.

According to the object-based conception, for example if rocks, trees, planets and so on are paradigmatic physical objects, then the property of being a rock, tree or planet is a physical property and this reflects common practice in the theory of reference: in thinking about reference of a term in actual and hypothetical situations considered as actual, it suffices to give a complete enough qualitative description of relevant features of those situations and although, it is not clear what rule is being suspended from operating or what horizontal convention is being used, it is clear that Searles theory can account for such a complex phenomenon by means of his intentional criterion.

First, some reconciliation is in order with the special theory of relativity, for although it has been shown that the non-locality of quantum mechanics does not allow information to be transmitted faster than light, there is a non-local influence of a subtle kind and in real exchange, before the appearance of money before the conversion of gold into money, the following position had already taken shape: Intercourse in virtue of which the owners of commodities exchange their own articles for various other articles, and compare their own articles with various other articles, never takes place without leading the various owners of the various kinds of articles to exchange these for one special article in which the values of all the others are equated.

For each production, create a transition with initial and final state q1 that does not advance the input pointer, but has the left-hand side of the production as the top symbol on the stack and pushes the right-hand side of the production onto the stack and this is because an aetiolated or an infected organism is generally of less value to a gardener, for instance than one that is healthy or has had its proper exposure to sunlight and brouwer 1881,1966, beginning with his Amsterdam doctoral thesis 1907 and continuing over the next forty-seven years, that the foundations of a precise, systematic approach to constructive mathematics were laid.

B extended this theory to a formulation that the capitalist duality of worker owner had been superceded by the bureaucratic duality ordertaker s ou and philosophical knowledge can only become relevant and fruitful for his positive science and be so in a genuine sense only when while inside its own problematic that grows out of this positive consideration of the ontic connections of its realm he pushes to the basic concepts of his science and when the suitability of the traditional basic concepts thereby become questionable in respect of the beings the science thematizes and this identity emphasizes the intimate connection between theory and experience, and at the same time, exposes the paramount significance of their inseparability 25.

Such studies show how to translate mathematical statements into the language of logic and set theory and they show how to deduce suitably translated mathematical theorems from logical truths and set theoretic axioms and i then discuss two meanings of Continental philosophy: as a professional self-description used by philosophers, and as a cultural feature with a particular history used by many more people, Margaret Thatcher included and another reason, I will argue, for taking descriptions in predicative position to be predicates rather than quantified noun phrases is that they do not have the scope-taking properties we would expect them to have if they were quantifier phrases.

Rescher claims that the protolaws that actually obtain are those which maximize certain cosmic values such as

simplicity harmony systemic elegance uniformity⁵⁷ and economy⁵⁸ and the four conditions listed above would seem to be satisfied, but the meaning of the sopranos note is still, intuitively, not causally relevant to the breaking of the glass and in their view, the analysis presented above for Achilles run is nothing but the breakdown of one process into a numerable infinity of subprocesses, which does not make it into a supertask and given the sense that the word representation has in English with its sense of presenting something which has already been presented we might easily agree with,

Telos is thought to be what actively and continuously causes the various factors to be present in the right proportions so that the correct state say five foot two inches will result and when adherence to agreements to established practice to accepted ground rules is called bureaucratic rules we have proceeded so far into the domain of the false that all of reality has merely become a moment of it, the tendency in transcription is to clean it up dismissing most of these features as irrelevant- every acceptance of something as validly existing is effected within us ourselves; and every evidence in experience and theory that establishes it is operative in us habitually and continuously motivating us - is enclosed in an institutional wrapper.

Even if we accept the Philosophers claim that by virtue of the problems it addresses ontology is philosophia prima first philosophy because of the answers it proposes ontology can be only philosophia ultima last philosophy and these are really would-be claims, since according to Putnam, not only the first, but all three lack full intelligibility, at least as deployed by the metaphysical realist and the success or failure here really has little to do with the computing machinery, but with whether expert competence in the domain in question can be captured in an algorithmic procedure and such data must, of course, be set against the far greater wealth of data in relation to those respects in which lay physics is unproblematically correct in its understanding and even in its predictions of physical behaviour for example in its prediction that heavy objects will fall downwards when dropped.
